Mr. Tormay does not claim for his oven the permanent features of other types of oven doors. His claim is that his is a good, cheap door, which will probably last two or three years, and which should show a liberal return on the investment. Figuratively speaking, it should prove to the small operator what the Ford car is to the automobile trade.

Shipping Losses from the War

The total gross tonnage of all ships captured, detained, sunk or damaged as a result of war operations during the first 13 months of the European war (Aug. 4, 1914, to Aug. 31, 1915), according to an official press association connected with the British War Office, amounted to nearly 4,000,000 tons and numbered close on to 3,000 vessels, as follows:

	Ships	Tonnage
German	521	1,113,298
British	476	980,773
Neutral	418	593,820
Austrian	75	154,282
Allied, French, Russian, Belgian	82	128,177
Turkish	56	18,508
Total	1,628	3,088,858

In addition, cargoes (or part of them) of 776 vessels (ranging from a tonnage of 500 to 25,000) have been detained, in many cases without delaying or seizing the ship itself.

Details of German vessels which have been swept off the seas follow:

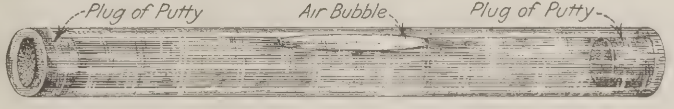
	Ships	Tonnage
Detained in United Kingdom and overseas ports	146	315,181
Captured in German colonial ports	21	43,367
Captured and sunk by British	8	29,424
Captured by British	75	186,765
Detained in Egyptian ports	18	86,038
Detained in Belgian ports	89	136,920
Detained in French and Russian ports	95	112,945
Detained in Italian ports	36	153,876
Captured and sunk by Allies	4	3,822
Captured by Allies	25	37,985
Sunk or damaged by submarines, mines or explosions	4	6,975
Total	521	1,113,298

Out of the 80 detained British vessels in German ports, more than 60 were lying at Hamburg at the outbreak of the war. Fifty-six British vessels were captured or sunk by enemy ships. The number sunk by submarines is given as 104, of 304,428 gross tons; 105 trawlers, of 15,087 tons, in addition to 31 vessels of the same class (with a tonnage of 4,229) sunk by mines or explosions. Of the Allied vessels, 14 of 37,048 tons were captured and sunk and 34 of 51,145 tons were sunk by submarines.

Engineers' Emergency Level

Every engine room has the means at hand for the construction of the convenient and accurate level described herewith. It is so simple to make as to appeal to anyone (*Power*, Aug. 31, 1915).

It consists of an ordinary gage-glass, nearly filled with water, and with its ends plugged with putty or other suitable material of a cementing nature. The bubble may be made as long as desired. As the glass is straight, the bubble will run throughout its length when one end of the tube is slightly elevated. The glass being round and usually reasonably straight, it can be turned over without affecting the location of the bubble or the accuracy of the level.



A GAGE-GLASS LEVEL

As the glass is straight and not curved to a radius like a tube constructed for leveling purposes, it is not necessary that the bubble be brought to the center. If the glass is perfectly true it will be level when both ends of the bubble are free from the cemented extremities.

The accuracy of the tube is attested by the rapidity with which the bubble passes from end to end of the glass on being slightly tilted from the horizontal position. It can be further tested by revolving the tube, part of a full turn, or by reversing its ends and noting if the bubble still remains with both ends free after this is done. If it does, its indications are probably reliable. This device is not intended to supplant the regular level, but it will serve in an emergency or when only a limited space is available.

* * *

Alabama Operators' Duty to Provide Props—The Alabama Coal Mines Act of 1911 should be interpreted as imposing an absolute duty upon operators to keep on hand a sufficient supply of props and timbers for use of miners in propping, and to deliver them on demand, but if those furnished are of suitable lengths and sizes no negligence can be imputed to an operator for failing to furnish props of the exact length demanded by a miner. (Alabama Supreme Court, Sanford vs. Stith Coal Co., 68 "Southern Reporter," 990.)

Outlook in Coal Mining

SYNOPSIS—Opinions of prominent coal-mining people throughout the United States as to the present condition and prospects of the coal-mining business. The verdict is almost unanimous in favor of greatly improved conditions this fall and winter.

More than 1,000 mine owners and officials of operating and selling coal companies were asked by the editor of *Coal Age* to give expression to their beliefs concerning the outlook in the coal trade this winter. Replies were received from every important producing field, and the following opinions are printed in the order of their receipt. No attempt has been made to eliminate unfavorable reports, so that the general verdict may be accepted as voicing the common opinion of American coal men.

The question submitted was as follows: What is the outlook for the coal business in your particular field this fall and winter? The replies follow:

NEW YORK CITY

Bulah Coal Mining Co.	Brisk
John Delaney, Mgr., Pittsvein Coal Co.	Good
W. A. Marshall & Co.	Very good
B. Nicoll & Co.	Very good; prices up

ALABAMA

S. J. Childers, S. J. Childers & Son, Jasper	Better
G. B. McCormick, Pres., Pratt Cons. Coal Co., Birmingham	Light this fall
Erskine Ramsay, Gen. Mgr., Pratt Cons. Coal Co., Birmingham	Much improved
J. C. Maben, Jr., V. P., Sloss-Sheffield S. & I. Co., Birmingham	Greatly improved within next 60 days due to rapid improvement in steel and iron business.
Sligo Coal Mining Co., Gadsden	Very much better
John R. Smith, Supt., Eagle Coal Mining Co., Jasper	Very good. We are opening a new mine and installing a new washery

ARKANSAS

Wm. C. Caudle, Gen. Mgr., Arkansas Valley Coal Co., Hackett	Moderately good

COLORADO

Pike's Peak Fuel Co., Colorado Springs	Very good in lignite coals
W. W. Curtis, Pres., Rapson Coal & Mining Co., Colorado Springs	Good
Charles Rankin, Gen. Mgr., Monument Valley Coal Mining Co., Strong	Fair

ILLINOIS

C. M. Wasson, Gen. Mgr., Wasson Coal Co., Harrisburg	Fine; extra good
P. G. Matheny, Sec., West End Coal Co., Springfield	Good
H. C. Adams, V. P., Jones & Adams Coal Co., Chicago	Greatly improved. Cars are scarce. Short cold spell would tax the Illinois mines.
E. C. Searls, Gen. Mgr., Majestic C. & C. Co., DuQuoin	Good
Charles Pointon, Sec., New National Coal & Mining Co., Belleville	Good
West Side Coal Co., Coulterville	Extra good
Thos. J. Edwards, Edwards Coal Co., Edwards	Very good
F. S. Peabody, Pres., Peabody Coal Co., Chicago	Good, with shortage of cars
Warren Penwell, Sec., Penwell Coal Mining Co., Pana	Good

INDIANA

John Hewitt, Gen. Mgr., Vandalia Coal Co., Terre Haute	Rushing
Bicknell Coal Co., Bicknell	Good
J. W. Frisz, Gen. Mgr., Kettle Valley Mining Co., Terre Haute	Good
Clay Moss, Gen. Mgr., United Fourth Vein Coal Co., Linton	Good
Sunbeam Coal Co., Terre Haute	Good
H. G. Conrad, Gen. Mgr., American Coal Mining Co., Bicknell	Good, but may be interfered with by car shortage, which is apparent at present. Some mines idle on this account

IOWA

F. H. Hunter, South Des Moines Coal Co., Des Moines	Normal
Anchor Coal Co., Ottumwa	Good
H. F. Garver, Pres., Enterprise Coal Mining Co., Des Moines	Good
Ogden Cons. Coal Co., Boone	Good; much better than last fall
K. G. Carney, Mgr., Saylor Coal Co., Carney	Good; men will be scarce
E. M. Sprecher, Gen. Sales Agt., Moulton	Good

KANSAS

Carr Coal Mining and Mfg. Co., Leavenworth	Heavier than usual
S. S. Patton, Gen. Mgr., The Patton Coal and Mining Co., Frontenac	Good

KENTUCKY

Kentucky Block Coal Co., Hazard	Good. Mines are running full time with orders ahead. New mines being hurried to completion
R. L. Wheeler, Pres., Brush Creek Mining and Mfg. Co., Wheeler	Extra good. High prices will prevail
J. L. Manring, Pres., Winona C. & C. Co., Middlesborough	Very good
Kentucky Block Cannel Coal Co., Cannel City	Good. A car shortage is threatened
C. N. Riker, Pres., Carbondale C. & C. Co., Paducah	Below normal; prices off
A. G. Spillman, Gen. Supt., St. Bernard Mining Co., Earlington	Good
W. O. Davis, Kentucky River Coal Corp., Lexington	Good. Operations all behind in orders
W. E. Davis, Gen. Mgr., East Tennessee Coal Co., Hazard	Excellent
Blue Grass Coal Corp., Hazard	Very good

MARYLAND

Wm. Ramsay, Frostburg	Very good. In Frostburg district all mines in full operation. Labor shortage surrounding districts
E. J. Roberts, Allegany Coal Co., Westernport	Fair
J. E. Hibline, Quemahoning Coal Co., Baltimore	Exceedingly good

MISSOURI

Farmers Fuel Co., Higginsville	Good on domestic coal
A. J. Moorshead, Pres., Madison Coal Corp., St. Louis	Only hope of industry in this vicinity is weather. A stiff winter may permit operators to secure some profit
Mt. Olive & Staunton Coal Co., St. Louis	Dependent upon weather
F. W. Lukins, Pres., Farmers Fuel Co., Kansas City	Good crops and good business are improving coal trade
Eureka Coal Mining and Mercantile Co., Rich Hill	Better than last fall
Laning-Harris Coal and Grain Co., Kansas City	Fair

MONTANA

R. J. Johannes, Pres., National Fuel Co., Helena	Best in history of state
Bear Creek Coal Co., Bear Creek	Especially good

OHIO

Harper Coal Co., Coalton	Good
Russell Coal and Mining Co., Cleveland	Above average. Business doubled in past 10 days. Mine running full time
John M. Wright, Pres., Raleigh C. & C. Co., Cincinnati	Good
Edward Lynch, Gen. Supt., Colburgh Coal Co., Baileys Mills	Good
The Pocock Coal Co., Massillon	Good
E. E. Learned, Sec., Elk Coal Co., Columbus	Good
Puritan Coal Co., Cambridge	Very good
W. R. Woodford, Pres., Rail and River Coal Co., Cleveland	Much better. Demand for coal improving owing to better business conditions
Edward T. Evans, Gen. Mgr., T. J. Evans Coal Co., Coalton	Fair

OKLAHOMA

H. C. Fellows, Henryetta	Exceptionally good. Junior coal company installing monster Bucyrus shovel. Fidelity Fuel Co. expects to sink two shafts
J. J. Pullen, Pres., Warden-Pullen Coal Co., Henryetta	Good

PENNSYLVANIA

(Anthracite)

A. B. Jessup, Gen. Mgr., G. B. Markle Coal Co., Jeddo	Better than past two years this fall and winter
T. M. Dodson, Gen. Mgr., Dodson Coal Interests, Bethlehem	Good
John A. Komara, Pres., West Mountain Coal Co., Jermyn	Very good
George F. Lee Coal Co., Wilkes-Barre	Very brisk. There will be big demand for coal which will be difficult to supply
E. H. Leaning, Gen. Mgr., Nay-Aug Coal Co., Scranton	Good
Chas. Schlager, Sales Agt., Traders Coal Co., Scranton	Very brisk

(Bituminous)

J. A. Gealey, Mgr., Leesburg Coal Co., New Castle	Much better
P. S. Thropp, Jos. E. Thropp Co., Everett	Nearly full time
W. V. Whiteman, Gen. Supt., Stauffer-Quemahoning Coal Co., Listie	Good. Car supply short
Keystone C. & C. Co., Pittsburgh	Better than for five years past
A. N. Cole, Gen. Supt., Pennsylvania Coal Co., Clarion	Good

Lloyd G. McCrum, W. H. Bradford & Co., Inc., Somerset	Very good. Now suffering from car and labor shortage
A. C. Speyer, Moreland Coke Co., Pittsburgh	Fair
E. J. Frauenheim, Jr., Pres., Logansport Coal Co., Pittsburgh	Greatly increased demand and better prices
Republic Iron and Steel Co., Republic	Good
J. A. Beam, Pres., Pine Run Coal Co., New Bethlehem	Better demand, and if there is a car shortage, better prices
F. H. Wigton, Pres., Morrisdale Coal Co., Philadelphia	Very active
B. F. MacCartney, Pres., Sugar Run & Dunbar Coal Co., Altoona	Very good. Not much change in prices, but big improvement in tonnage
George T. Robinson, Pres., Conemaugh Smokeless Coal Co., Johnstown	Very good. Looks like shortage of labor here
C. P. Burtner, Gen. Mgr., C. P. Burtner Coal Co., Altoona	Better. Shortage of labor and cars will restrict cutput
M. W. Saxman, Pres., Ligonier Coal Co., Latrobe	Good
W. S. Blaisdell, Anita Coal Mining Co., Punxsutawney	Good
(Coke)	
Thomas McCaffrey, Gen. Mgr., Brier Hill Coke Co., Brier Hill	Better than it has been since 1912. Shortage of miners
A. Q. Davis, Gen. Mgr., Browning Coke Co., Uniontown	Better than for two years
S. A. Carson, Gen. Mgr., Southern Connellsville Coke Co., Uniontown	Good. Expect high prices on both coal and coke due to shortage of miners. This is becoming more pronounced each day
Wm. Allison, Mgr., Union Connellsville Coke Co., Uniontown	Very good
T. S. Lackey, Pres., Buckhannon River Coal Co., Uniontown	Good. Independent operators in Fayette County expect $3 coke before spring
James Edgar Hustead, Gen. Mgr., Hustead-Seamans C. & C. Co., Uniontown	Very good. Coke business improving each month. Men will be scarce in 60 days
TENNESSEE	
James R. Wooldridge, Pres., South Appalachian Coal Operators Assn., Knoxville	Good. Less coal than usual has been yarded. European War will not affect weather where our coal is used
Wm. J. Brown, Pres., Hazard Coal Land Co., Bristol	Very good. Our lessees report abundance of orders at good prices
J. H. Jones, Gen. Supt., Durham Coal and Iron Co., Soddy	Decidedly better
S. W. Jayne, Sales Mgr., Climax Coal Co., Knoxville	Very good Not over 50% of stocks on hand and indications of a car shortage
J. J. Campion, V.-P., Carolina, Clinchfield & Ohio Ry., Johnson City	Very good
TEXAS	
L. C. Libby, Mt. Pleasant	Fair
UTAH	
George A. Storrs, Gen. Mgr., Spring Canyon Coal Co., Provo	Good
VIRGINIA	
C. B. Neil, Secy., Raven Red Ash Coal Co., Red Ash	Very good
J. L. Moon, Gen. Mgr., West Virginia Coal Co., Richmond	Exceptionally good
C. J. Creveling, Blackwood C. & C. Co., Blackwood	Good
WEST VIRGINIA	
J. W. Bischoff, Gen. Supt., Davis Colliery Co., Elkins	Better than for eight years. We are spending considerable money to be able to take care of increased business. Big problem is labor supply.
George W. Jones, Mgr., Star Coal and Coke Co., Red Star	Good
H. A. Zeller, V.-P., West Virginia Rail Co., Huntington	Good. Mines working better and prices higher
A. S. Brady, Pres., Brady Coal Co., Piedmont	Very good
J. C. Watson, Gen. Mgr., Masteller Coal Co., Keyser	Reasonably active. Demand is increasing and prices advancing
H. S. Brown, Secy., Extrapoca Coal Co., Bramwell	Good
Josiah Keely, Gen. Mgr., Cabin Creek Coal Co., Kayford	Fair
J. M. Moore, Gen. Mgr., Coal River Co., Ottawa	Very much better. Many companies declining to accept orders even at advanced prices
Alex. H. Tait, Pres., Great Scott C. & C. Co., Morgantown	Very good. Shortage of miners and cars
A. P. Brady, Gen. Mgr., Monongalia Coal Co., Fairmont	Very good
E. Echols, Treas., Big Bend Coal Co., Dimmock	Fair
J. G. Bradley, Gen. Mgr., Elk River Coal & Lumber Co., Dundon	Booming
WYOMING	
P. J. Quealy, Gen. Mgr., Kemmerer Coal Co., Kemmerer	Fairly good, but considerable over production
H. Larsen, Gen. Mgr., Nebraska Coal Co., Rawlins	About the same as usual

Extracts from a Superintendent's Diary

For some time we have been attempting to enforce the company rule that prohibits more than one day's supply of explosives to be taken into or stored at any time in a working place. It has been a trying experience.

Last week one of our firebosses suggested that we confiscate each night all of the explosives found in a working place where a full tonnage of coal had been loaded.

We discussed the matter fully and decided to adopt the suggestion without notifying the men of our decision. We assumed that the men who found themselves victims of the plot would keep silent rather than expose their malfeasance, and thus in time we could punish all of them.

Everything would probably have worked out according to schedule, but for the fact that one of our firebosses (Tom Murry) believes in practical jokes and could not resist the opportunity offered.

The day after we confiscated the first lot of explosives, Tom spread a rumor among some of the miners (picking his men so that the tale would reach indirectly certain hotheads whose powder had been confiscated) that a certain union official (Sam Rawlings by name) hadn't bought a pound of explosive in two weeks.

Tom builded better than he knew. Not one of the victims of the powder raid stopped to inquire into the source of the rumor, but every last one of them started out to find the union official on whom suspicion rested. It happened that the suspect was not at work that day, and as this became noised about to the men in the mine, suspicion was strengthened; so much so, in fact, that all of the victims began to plan openly for revenge.

In order to get the evidence in shape to justify extreme measures they appointed a committee to go to the commissary and find out just how much powder Sam really had purchased during the past 30 days. That would give them evidence that could not be questioned. The committee carried out their instructions, but when they learned that the commissary records showed Sam Rawlings to have purchased in excess of the average quantity for the month, they were dumfounded and did not know what to do or say. Instead of going back to report, they hung around, trying to fathom the mystery.

In the meantime Sam Rawlings got word that a committee was hanging around the commissary and for some reason which the messenger did not understand they were making frequent mention of Sam's name.

As soon as Sam got rid of the messenger he carried out a determination that he had had in contemplation for some time—he packed all of his belongings in a suitcase and disappeared into thin air. That same night one of our commissary clerks who knew more than he cared to divulge about Sam's reasons for departing so unexpectedly also left camp, covering his tracks as he left.

All's well that ends well, but in this instance all did not end well for the practical joker who started the ball of adventure to rolling so violently in our midst. The commissary clerk who had assisted Sam Rawlings in his treachery (whatever it may have been, and which from present indications apparently will always remain a mystery) boarded with Tom Murry, and when he quit so unceremoniously, he left behind a board bill amounting to $20, which in the course of human events would have been paid the following Monday.

Proposed System of Longwall Mining in Panels

By F. C. Cornet*

SYNOPSIS—A system of mining by longwall faces arranged in panels is here described. All haulage roads and airways are maintained in solid coal. For a given output fewer switches are required and the work is more concentrated.

No longwall mining scheme is likely to make itself attractive which does not permit of developing the mine and reaching a given output as rapidly as would be the case with the old reliable room-and-pillar system. In every case quick results are an important condition.

The scheme submitted probably realizes this end as nearly as it will ever be practicable to do when the absence of refuse material prevents the building of pack walls and all haulages and airways must be maintained in solid coal. The seam for which the system was primarily devised is 55 in. thick, all clean coal, nearly flat, and makes no water. All conditions that go toward making longwall mining advisable are met with in this seam. Observations made in old workings warrant the expectation that simple propping, using posts of 5 in. diameter set 7 ft. apart in both directions, will maintain, for months if necessary, a clear space of 20 to 30 ft. between the edge of the falls and the working face. Fig. 1 shows how it is intended to develop the mine, the full lines indicating to what extent it will probably be necessary to develop it in order to reach an output of not less than 1,000 tons in a 9-hr. day, using only one man in each place, narrow or wide, and allowing a space of 20 ft. to each loader working on longwall. No crosscut is counted as a place. The dotted lines in Fig. 1 show what little amount of extra development would be necessary in order to increase the output by about 300 tons. As may be seen from Fig. 1, a long face is primarily formed by one of the ribs of what has been designated as a long room. The so-called border rooms, driven on the same course as the lateral entries and consequently at 90 deg. with the long room, always well ahead of the latter, determine the length of the long face, which in this case is 500 ft., although it could well be made substantially longer.

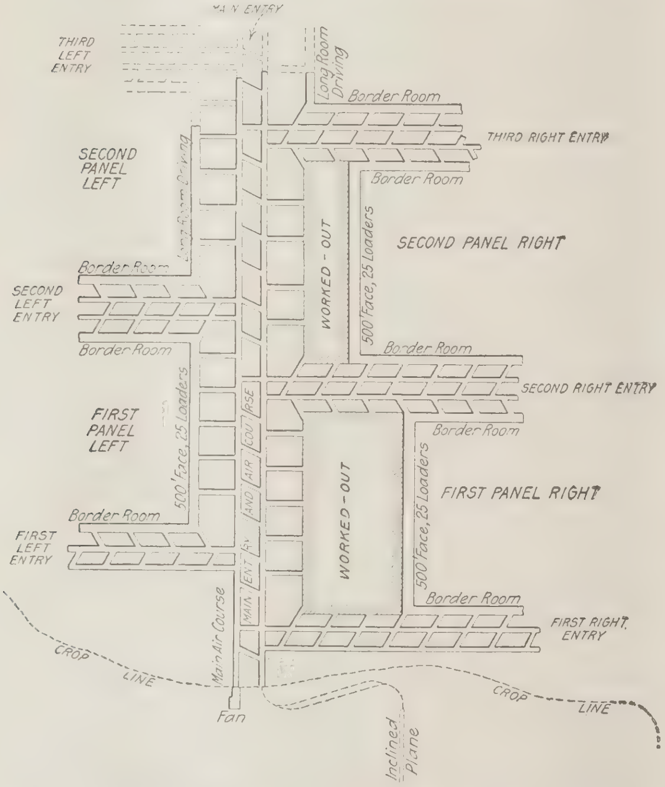


FIG. 1. SHOWING HOW IT IS INTENDED TO DEVELOP THE MINE

The long rooms and border rooms are driven wide, as are also the crosscuts or passageways by which the border rooms are reached from either the corresponding lateral haulage or air course. This reduces the amount of narrow work in a given entry to exactly what it would be in the case of the room-and-pillar system. Fig. 2 shows how ventilation and haulage are done, the second panel right having been selected from Fig. 1 and drawn on a much larger scale in order to make plainer such details as overcasts, stoppings, regulators, curtains, haulage tracks and switches and also the directions of all air currents.

The distribution of air shown in Fig. 2 is probably the most advisable one in the case, but it would not be difficult to show one or two other systems of haulage tracks just as good as the one here drawn.

Face Is Supplied with Cars from Both Ends

The tracks shown in Fig. 2 are so arranged that the lower half of a longwall face is supplied with empties and the loads removed from the lower end, while the service of the upper half is effected from the upper end. This makes it unnecessary to stop all work in more than one-half of each face while a trip of cars is being changed. It also cuts in half the number of cars to be taken in or out at one time. Twelve or 14 cars might well be handled by one gathering motor, while 24 or 25 cars would be too many to be pushed in or pulled out by the same machine at one operation.

In figuring the output of the mine shown in Fig. 1, it has been assumed that a coal loader requires 20 ft. of space in order to work freely and at his full efficiency, loading 12 tons a day. This would place 25 loaders along a 500-ft. face, loading 300 tons a day. In this coal, a machine cut 5½ ft. deep and 500 ft. long will yield 600 tons; consequently, two days will be necessary to load out one cut.

If necessary, by allowing only 10 ft. of space to a loader, placing 50 men on each face instead of 25, a cut could be cleaned up in a day; but this might prove too crowded a condition and one which would not give each man enough space and freedom to load all the cars he could get. The 20-ft. space adopted in the output calculations is

---

*317 Laidley St., Charleston, W. Va.

perhaps a little large for one man, but this only shows that there is no exaggeration in an output of 300 tons a day from a 500-ft. face.

In case of necessity, the loading force could be increased to, say, 35 men, and while under these conditions the output per man might be reduced to 11½ tons per day, it would increase the output of a face to 402 tons per day. All mining men will easily remember occasions in their experience when they would have been glad to increase by 33% and with little trouble the output of some part of their mine.

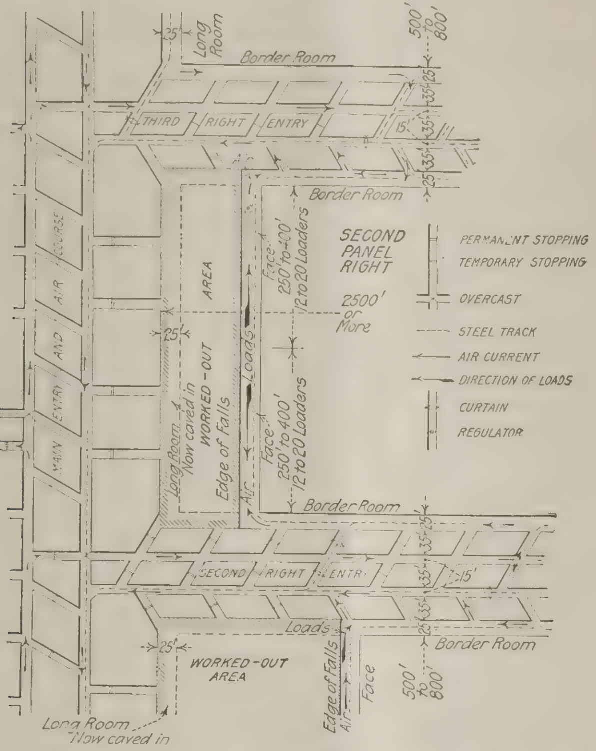

FIG. 2. PLAN SHOWING VENTILATION AND HAULAGE

Fig. 3 shows how a room-and-pillar mine would appear after driving the same total length of narrow work as in the longwall mine shown on Fig. 1. In both cases, the total length of haulways and airways is 7,680 ft. It is absolutely fair to suppose that the development work in the room-and-pillar operation would not be done quicker than in the longwall case. Fig. 3 shows the mine with all rooms 30 ft. wide, driven on 60-ft. centers, all the rooms being 300 ft. long. All this is considered good practice in the coal field under consideration. The same thickness of protective pillar, 100 ft., has been kept on each side of the main entry and air course in both the room-and-pillar and the longwall cases.

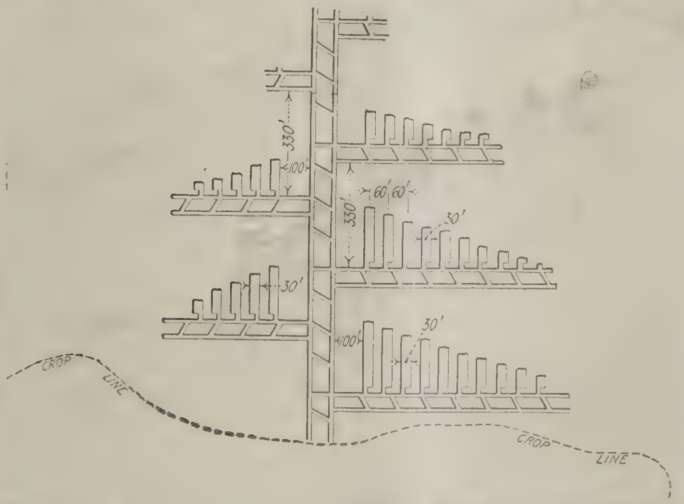

FIG. 3. A ROOM-AND-PILLAR MINE WITH SAME LENGTH OF NARROW WORK

The accompanying table gives a good idea of the comparative standings of the two mines so far as the operating features and outputs are concerned. These figures speak for themselves and need no comment.

COMPARISON OF TWO SYSTEMS OF DEVELOPMENT

Longwall Mine:	
Men on longwall, 75, loading 12 tons each	900 tons
Men in wide places, 10, loading 11 tons each	110 tons
Men in entries, 12, loading 10 tons each	120 tons
Total conservative output of the mine per day	1,130 tons
Total length of narrow work	7,680 ft.
Total length of steel tracks	8,450 ft.
Number of switches in the mine	35
Room-and-Pillar Mine:	
Men in wide places, 39, loading 11 tons each	429 tons
Men in entries, 16, loading 10 tons each	160 tons
Total conservative output of the mine per day	589 tons
Total length of narrow work	7,680 ft.
Total length of steel tracks	9,120 ft.
Number of switches in the mine	54

⁂

New Coal Rates in Ohio

There is no car congestion in Ohio as yet, although the railroads appear to have some anxiety along these lines. It has been stated on what appears to be good authority that the situation in Ohio so far as the railroads are concerned will be relieved in the near future by a readjustment of rates and that Toledo will become the basing point in fixing the new rates on coal shipped from Ohio and West Virginia mines to points in Ohio, Michigan and Indiana. New coal freight-rate schedules, it is stated, will be filed with the Interstate Commerce Commission within 30 days.

The railroads that have become parties to the agreement are the coal-carrying lines of western Pennsylvania, Ohio and West Virginia. The new schedule will increase by 60 per cent. the differentials in favor of Ohio coal as against West Virginia coal. The rate on West Virginia coal to Toledo is to be 40c. greater, according to the agreement, than the rate from the Ohio mines. The rates on West Virginia coal to all other points in Ohio, Michigan and Indiana are to be increased proportionately. This action is designed to relieve the situation in the Hocking and other Ohio coal fields, where mines are closed and miners are suffering greatly.

W. A. Gosline, Jr., head of the Toledo Chamber of Commerce and president of W. A. Gosline & Co., in a recent interview concerning the matter said: "The proposed increase in rates will help some, but will not entirely solve the problem. There are other important elements that have contributed to the closing of the mines and the consequent deplorable plight of the miners. Among these are conditions imposed by the miners themselves that the operators have been unable to meet. If the problem is to be solved entirely the miners must meet the operators half way. The increased differential in favor of Ohio coal is but one step. The state screen law is no longer much of a factor, as some of its most serious provisions have been eliminated." Mr. Gosline is doubtful whether the action of the railroads will influence the reopening of the mines.

Repairing Broken Tapes

By H. M. Wassum*

Steel measuring tapes are frequently broken even when handled carefully. The repairing of a broken tape has often been a somewhat lengthy job and one not relished by the average mine engineer. However, it has well been said "that necessity is the mother of invention," and within late years the mending of a broken tape takes only a few minutes' time.

Many surveyors carry a small vial containing a solution composed of zinc chloride ($ZnCl_2$) and a little water, a small coil of ⅛-in. round solder and several thin strips of tin about ½ in wide. Sleeves just large enough to slip over the ends of the tape can be quickly made from the tin. After the dirt and rust have been thoroughly scraped off the tape and the broken ends brightened the latter are dipped in solution and the tin sleeve slipped on.

By holding an open light or a match beneath the sleeve, the tin and tape, being thin, will heat rapidly, and if the solder is then touched to the joint it will melt and fill all the spaces. If too much solder sticks to the joint it can be brushed off before it cools, and a neat, strong joint is the result.

There is now on the market a kit called the "Eureka Tape Repairer." It is a small round box containing a dozen tin sleeves cut to the correct width and coated with solder solution. The box also contains a small piece of emery cloth for use in brightening the broken ends. Complete directions are printed on the box and if followed a neat joint as strong as the original tape can be secured. The kit can be carried in the vest-pocket and has the advantage of containing nothing breakable.

An Electric Safety Lamp

In 1912 the British Home Office held an international competition for the best electric mine-safety lamp, open to all competitors both British and alien. There were 197 competitors, a number of whom were British. Though their lamps contained many excellent qualities, with characteristic fairness the first prize was awarded to a German firm—the Concordia Electricitäts Actien Gesellschaft of Düsseldorf. This lamp was known as the "Ceag."

In 1913 this same lamp took first prize at Ghent, and this year the Concordia Safety Lamp Co., Inc., of Pittsburgh, Penn., was awarded approval No. 12 of the Bureau of Mines for safety, efficiency and practicability under the exacting schedule 6A. The lamp thus approved was substantially the same as that awarded first prize in the British competition. As a further recognition, the Concordia Safety Lamp Co., Inc., was awarded a gold medal at the Panama-Pacific International Exposition. This award was made in recognition of the excellence of the electric mine lamp presented and of the lamp house and accessories. The firm was also given a silver medal in recognition of the exhibit that it made in collaboration with the United States Bureau of Mines.

Analysis of the Coal-Car Situation

Compiled by A. T. Shurick

Supplementing the article on the car-supply outlook which appeared in *Coal Age* of Sept. 25, p. 506, we present herewith some statements received since the previous article was printed.

Baltimore & Ohio R.R.

The matter of car supply is receiving careful consideration and plans are being formulated to meet the situation by expeditious handling and loading along scientific lines. Orders were also placed during the last few months for additional coal cars and contracts let for rebuilding part of our present equipment. The outlook this year is similar to that of 1913, when traffic was unusually heavy; but in view of the purchases of new equipment since then, both cars and locomotives, it is believed that the business will be handled with even greater facility. Another favorable factor is the improvement work completed since 1913, providing additional tracks, yards and other facilities.

During the last month the board of directors authorized the construction of what will be the largest coal pier ever built, costing approximately $1,500,000 and having a capacity of 10,000,000 tons a year. This will require about eighteen months to build, so it will not be available this year; but it indicates the provision which the road is making for future terminal facilities. This road has expended during the last five years about $100,000,000 for general rehabilitation, extra running tracks, larger yards and bigger docks and equipment.

Chief among these improvements were the third and fourth track lines on the eastern end of the system in the mountainous districts, where grades were reduced and curves eliminated. The Magnolia cutoff, a 12-mi. short line east of Cumberland, which provides a low-grade line for coal traffic, was opened recently. This involved an expenditure of about $6,000,000. The average trainload over that section of the line has been raised from 550 tons in 1910 to 1,132 tons at the present time.

A large classification yard has been constructed at Grafton, W. Va., with a capacity of 1,200 cars. To further facilitate the movement of coal from the Grafton, Fairmont and other regions of West Virginia to the Great Lakes a bridge was built across the Monongahela River between Hayward and Lumberport, which has also been augmented by a yard at Hartzell, W. Va., for the making up of trains for the lake traffic. This has made it possible to route the heavy traffic over the light grades of the West Virginia Short Line and the Ohio River branches. The yard at Holloway, Ohio, was enlarged for the coal destined to the lakes.

To meet developments in the Somerset region of Pennsylvania we have built a 9-mi. extension of the Quemahoning branch. A large assembling yard, used chiefly for coal, with a capacity of 450 cars, was constructed at Somerset, Penn. A low-grade line was built between Rockwood and Garrett, as a part of the enlargement of facilities in the Somerset region, which makes it possible to operate trains of maximum tonnage.

At Baltimore the capacity of the receiving yard in the Curtis Bay coal terminal was increased to 2,390 cars by adding facilities for 800 extra cars.

Since July 1, 1909, the road has bought 33,153 freight cars, 25,000 of which were for the coal trade, and 691 locomotives, of which 595 are in freight service.

Illinois Central R.R. Co.

By W. L. Park, Vice-President

From the experience gained in handling the coal traffic of the 1914-15 coal season the Illinois Central finds itself unusually well equipped to take care of the prospective traffic of the 1915-16 season.

Great strides were made during the last coal season toward placing the Illinois Central in a physical condition to handle all the traffic offered. The additions made to the coal-car equipment, as well as freight engines and switch engines, together with grade reductions, new second track, yard extensions and improved mechanical facilities, which were undertaken or completed during that time, have been unusually large. These included an investment of about $11,589,000 for new rolling stock, as follows: 7,500 new all-steel coal cars, 100 Mikado type freight engines, 62 switch engines and 45 Pacific-type locomotives, which relieved a number of freight engines theretofore used in passenger service.

An adequate supply is still further assured by reason of increased efficiency in car movement as a result of the purchase of 50 freight and 22 switch engines, which were put in service during March, April and May of this year, and another lot of 50 engines ordered for delivery this season. In addition the continuous service of several thousand wooden coal cars is assured during this season, due to steel underframe reinforcement and body reconstruction work done on them during the last year.

In view of the foregoing and the fact that the Illinois Central had a generous surplus of coal cars on its lines throughout the entire 1914-15 coal season, we approach the coming period of heaviest coal loading without any misgivings as to our ability promptly to meet car requirements for all the traffic which may be offered, even though it materially exceed the amount handled in any previous season.

Chicago & Eastern Illinois R.R.

By William J. Jackson, Receiver

In view of the large anticipated crop movement and the stimulation of general business conditions, it is our opinion there will quite likely be a coal-car shortage. Added to the general improvement in business is the prospective shutdown of the mines next April on account of the coal-miners' wage agreement expiring at that time. This should stimulate business during the winter months, when large consumers will want to stock coal, and will have a further tendency to make a car shortage.

It is a satisfaction to be able to state that this road was never in a better physical condition to cope with the demands of a heavy coal traffic or the needs of the coal trade. Large expenditures have been made, and the roadway and equipment are in first-class condition to handle expeditiously a big tonnage. If the producers and consumers will coöperate with the railroad in handling the traffic by promptly loading and unloading the coal cars, the fast service which we are prepared to give should minimize any car shortage.

The Labor Situation

SYNOPSIS—The labor leaders in the Hocking Valley region of Ohio meet to discuss whether they will keep their plighted word, and adjourn deciding they will not. Most of the Hocking operators will remain idle till the April settlement. The Colorado Fuel and Iron Co. prepares to sign a contract with its men.

Thomas Butler, the man who ventured to criticize the mine officials of District No. 9 of the United Mine Workers of America and was suspended from membership, is endeavoring to have the injunction prohibiting his exclusion from the union made permanent. James J. Moran and James B. Reilly, who are the attorneys for District President James Matthews and other officials of the district, filed on Sept. 28 a denial of the charge that they conspired to keep the name of James Butler off the ballot for district president.

The case is quite important, as it will decide whether the officials or the men constitute the union. The miners have objected because Professor Scott Nearing has been excluded from the University of Pennsylvania for his socialistic utterances but the muzzling of Butler is like an exclusion of one of the paying students and not of a hired member of the faculty. It may always be permissible to hold the employers of a state, university or union to a strict accountability but we strike at the freedom of the people when we forbid the electorate to express its opinions. It is therefore hoped that Judge Brumm who is trying the Butler case will decide to free the union electorate from any trammels which may be put upon it by the officials.

Hocking Valley Miners Repudiate Agreement

The miners' convention in the Hocking Valley subdistrict in session at Athens, Athens County, Ohio, invited the Hocking Coal Operators' Association to meet with them and discuss the situation. But the convention which followed was entirely without result. The miners' state officials, President John Moore, and Secretary-Treasurer Savage told the assembled delegates and operators that the clause regarding working conditions was not a part of the wage contract and that the joint scale committee had not even considered such a clause at the time of the last joint convention when the Hocking scale was made.

The clause requiring equal conditions in the districts was not signed by the miners as it was not actually in the contract. There was a verbal understanding only. The contract proper was signed by the miners' representatives and when the operators were asked to affix their signatures they added the clause that expressed their understanding of the contract placing it below the signatures of the miners' representatives. To the whole document as amended the operators appended their signatures.

It is clear that the operators are not bound by their agreement because the miners have violated the clause subject to which the operators signed their assent. But the miners' leaders had previously agreed verbally not to violate the condition appended to the contract and by accepting it as it was written laid themselves still further open to compliance with its provisions. If the clause is not binding on the consciences of the miners, then the operators could never have been bound by their signatures. By endeavoring to escape the clause the miners convict themselves of double dealing.

Six Months of Idleness in Eastern Ohio Threatened

The operators producing 75 per cent. of the tonnage declare that they will not open their mines till the April, 1916, settlement is reached. Thus six months or more of idleness is likely to follow the decision of the miners. Meanwhile many changes may occur. Improved times may make the operators more ready to start work because operation may become temporarily profitable regardless of the conditions and the wage scale. Moreover, the burden of poverty may bear heavily on the miners. There are 8,000 of them idle, and the union has promised to help them as it did the eastern Ohio miners to whom $1,500,000 was contributed.

President Moore asserted that internal differences among the coal operators and price cutting and not unfair conditions were the main factors which were destroying the coal business in Ohio. Among those declaring that their mines will be shut down are John H. Winder, manager of the Sunday Creek Coal Co. and G. C. Weitzell, president of the New Pittsburgh Coal Co. The latter declared that the mines would shut down at the close of navigation and remain idle till Apr. 1 of next year or until the miners made concessions similar to those granted operators in eastern Ohio.

The arbitration board in the eastern Ohio field consisting of C. J. Albasin, J. J. Roby and Thomas P. Wangler—the first two representing the miners and operators, respectively, and the last being the umpire—have been considering difficulties arising under the recent agreement. The miners and operators were not able to reach an understanding, and so the arbitration board was established.

The first matter considered was whether the miners at the Pursglove-Maher Coal Co.'s mine were subject to a fine of a dollar per day for going on strike. The union declares that the miners were not authorized in quitting work.

Under the agreement the miners are not permitted to strike for any other cause than nonpayment of wages. The conciliation and arbitration boards are supposed to look after their needs without the necessity for striking. The miners claim that the operators locked them out and that they were not responsible for the stoppage of work.

Strikes Which Are in No Way Discreditable to the Miners

On Oct. 1 the miners of the George M. Jones Coal Co., at Bellaire, Ohio, went on strike to enforce run-of-mine payments. But to their great credit they decided after a day's idleness and a meeting to give the company more time to install the necessary scales. The miners could hardly be blamed if they violated their agreement to bring to an end such an obvious breach of contract as the failure to place and use scales by which all the coal mined could be weighed.

The union has announced that it will stand by the men in such violations of the agreement and no just complaint can be made of its action. The Pulteney miners have twice extended the time allowed their employers for placing run-of-mine scales, but no scales have yet been installed. It is useless for the operators to condemn the union if they do not propose to do any better.

Rockefeller Delivers His Industrial Representation Plan

On Oct. 2, 30 miners' representatives met the officials of the Colorado Fuel and Iron Co. in the club room of the steel plant at Pueblo, Colo., John D. Rockefeller, Jr., being present. Mr. Rockefeller described in detail the industrial representation plan devised by him and W. L. Mackenzie King. He explained that he and the other holders of C. F. & I. Co. stock had not received a cent from their holdings for 14 years. He condemned those who urged the miners to do as little as they can and get as much as they can for what little they do.

Among the delegates were seven members of the United Mine Workers of America representing the miners of Fremont County who had at one time been on strike against the company. The details of the plan will appear in the issue of "Coal Age" of Oct. 16, and one feature of it is commented on editorially in this present number. Five out of the eleven directors of the Colorado Fuel and Iron Co.: John D. Rockefeller, Jr., J. F. Welborn, president; S. G. Pierson, vice-president; J. A. Writer, secretary, and Cass Harrington, general counsel, held a meeting on Oct. 4 and approved the new arrangement unanimously. The other directors are expected to sign the minutes so as to give final ratification for their side of the agreement.

The delegates submitted it to a referendum of the miners and the vote received up till Oct. 5 showed that the ayes were 11 times as numerous as the noes. The ballot showed on that date 1,192 votes in favor of the agreement and 106 votes opposed. The union, of course, condemns this arrangement in which it does not share but which it appears powerless to prevent.

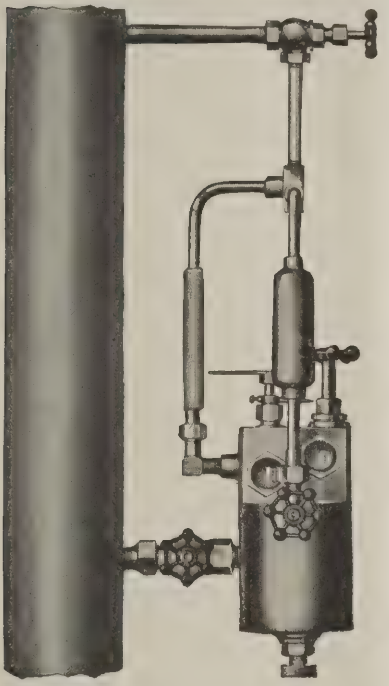
There is much talk that the cases against the 400 rioters who committed pillage, arson and murder will be withdrawn. Several citizens of Colorado, and some say John D. Rockefeller, Jr., have asked that this be done, but both the governor and Mr. Rockefeller deny that the latter has made any such request. John McLennan, the district president of the United Mine Workers' Union, has asked for this disposition of the cases and every indication seems to favor such a result.

The crimes charged are extremely flagrant and should be punished. The practice of sentencing men for trifling offenses and pardoning the most cruel and violent is getting only too frequent. We are afraid we might hurt the better and nobler instincts of a murderer by making him suffer his penalty. The minor criminal who is far more worthy of consideration serves the full extent of the law because by the unimportance of his case he fails to arouse the interest of the public.

New Apparatus and Equipment

New Grease Lubricator

A new and improved type of drop-feed grease lubricator, known as Class D, is now being offered to customers of the Ohio Grease Co., of Loudonville, Ohio. This is said to be the "last word" in lubricator construction. It is extremely simple and contains many points of refinement, such as better feed regulation, smaller drops, more perfect atomization, insulated tubes, protected sight glasses, etc.



THE NEW LUBRICATOR

Reports show that this lubricator is giving even better service than those which this company has put out in the past. This new instrument, like its predecessors, is not sold, but is loaned and kept in repair free for the purpose of feeding Ohio cylinder grease.

The grease has recently been greatly improved through the discovery of better raw materials and new methods of compounding. The company reports that the combination of this new lubricator and better grease has resulted in success wherever they have been used.

※

A New Safety Shaft Gate

A new type of safety gate for mine shafts has been invented and placed on the market by Lewis Hohnke, of Allport, Penn. This gate is shown in the accompanying illustration.

The gate is located at a landing where the cage comes to rest for the purpose of loading or unloading men and material. It does not open automatically and can be opened by hand only when the cage is in the proper position. It may, however, be closed by a spring or a weighted cable. The arrangement here shown, which effectively prevents the gate from being opened when the cage is not in its proper position at the landing, prevents anyone from falling into the shaft.

There is a strong belief among many mining officials that the gates at shaft landings should not open automatically. There is, however, an equally strong belief that such gates should be unlocked automatically by the cage arriving at the landing. Such an arrangement renders it possible to open a gate or get inside of the shaft inclosure only when a cage is at the landing.

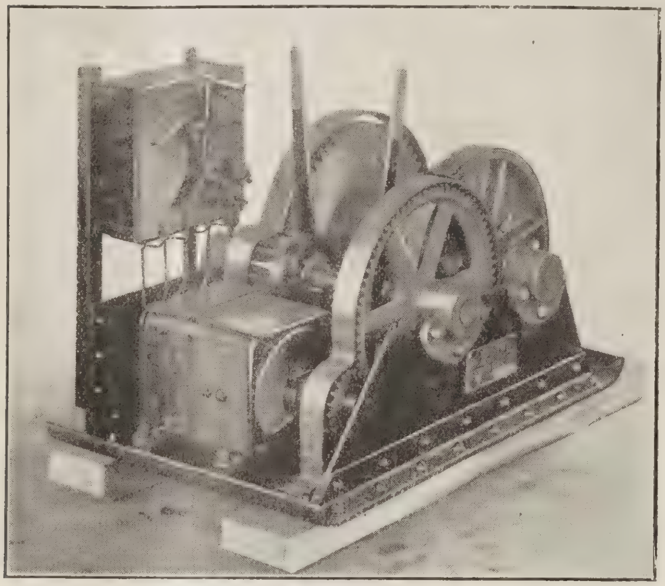
Portable Electric Room Hoist

The room hoist shown in the accompanying illustration has been placed upon the market by the Mead-Morrison Manufacturing Co., of East Boston, Mass. This machine is perhaps of more general or all-around use than any other to be found in the mine. It is self-contained, compact and powerful, making it readily applicable to many of the hauling problems encountered underground.

The frame is made of structural and plate steel, thus lessening the possibility of breakage in this part of the mechanism. The entire machine is mounted on steel skids and may thus be easily moved from place to place. The operating mechanism is simple and may be handled by almost any one.

A jaw clutch permits of the drum being thrown out of gear, allowing the miner to carry the rope back in the entry to his car, then return to the hoist and pull his load out. The gear ratio is such that a maximum of power is transmitted to the drum, thus permitting heavy loads to be handled.

This hoist has been kept small and compact so that it could be used in places not accessible to mules. It is powerful, however, and may be used in large mines, not only at the mouth of entries to collect the cars to that point in place of a gathering locomotive, but also in moving cars under and around the tipple, and for other general haulage purposes about the mine.



THE NEW ROOM HOIST

This machine is commonly built in two sizes, either of which may be equipped with alternating- or direct-current motors. The sizes are 2-hp. (capacity on single-line 600 lb. at a rope speed of 100 ft. per min.) and 4-hp. (capacity 1,000-lb. pull on a single line at a rope speed of 125 ft. per min.).

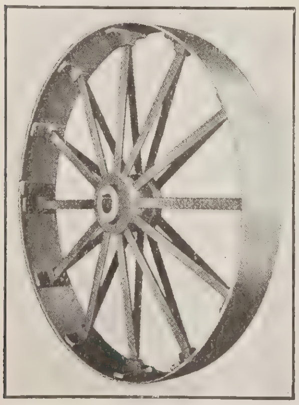
⁂

A New Heavy-Duty Pulley

A type of pulley designed for special and heavy service is being placed on the market by the Medart Patent Pulley Co., of St. Louis, Mo.

In the construction of this pulley the arms are made of flat, wrought steel. The hubs and rim lugs, of semi-steel, are cast onto the ends of the arms or spokes, which are so shaped as to afford a perfect and rigid connection. The rim lugs are ground to a perfect circle, and a heavy steel-plate rim is attached by rivets. There is thus no shrinkage stress whatever upon any portion of the pulley.

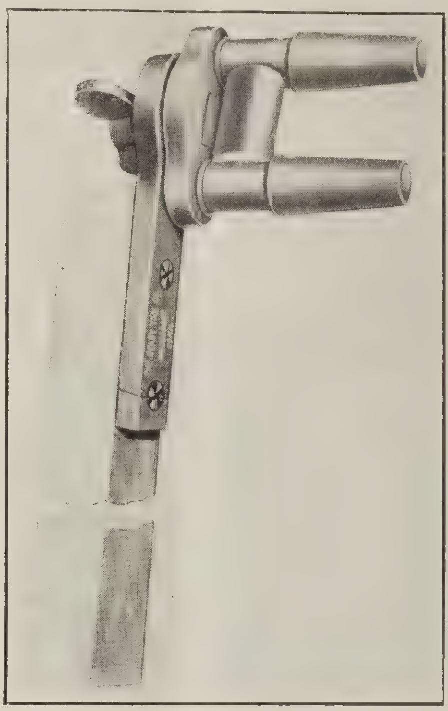
This type of pulley may be constructed with a single or double set of arms, also in either solid or split type in any diameter from 3 ft. to 15 ft., and with a face up to 50 in. in width. The arms, hub, lugs and thickness of rim may be made to suit conditions of severe service.



HEAVY DUTY PULLEY

Safety-First Belt Shifter

Everyone about the mines who has had experience with belts appreciates the annoyance, difficulty and danger in replacing the belts upon pulleys on line or counter shafting. To obviate these, the Ready Tool Co., of Bridgeport, Conn., has placed on the market what it calls a "safety-first" belt shifter or belt stick.



THE SHIFTER ON POLE

In place of the hook or pin usually found on the end of a belt-shifting pole, this belt shifter carries a swiveling head on which are located three rollers—one with its axis parallel to the yoke upon which it is carried, while the two others are set at right angles to this yoke. The latter are tapered toward their outer ends.

Due to the taper of the two transverse rollers, there is no chance of the shifter being caught in the belt. After the belt is placed in the fork the tendency at all times is for it to slide onto the pulley and the fork to move away from the belt, thus overcoming the possibility of accidents.

This simple device not only saves time but furnishes a safe means of shifting belts and throwing them on or off a pulley while the latter is in motion.

⁂

Mine-Refuse Disposal Dump

A type of dump designed especially to handle a maximum amount of mine refuse with the minimum amount of labor, to avoid cribbing and trestling, and to enable a pile of any desired shape to be formed, has been recently placed upon the market by the Dempcy-Degener Co., of Pittsburgh, Penn., and is known as the Saxon movable slate dump.

This dump consists essentially of a movable cantilever tipple, which overhangs the dump proper and deposits the material sufficiently far ahead to build its own roadbed. It is fitted with an electric rope hoist having a capacity of approximately 2,000 ft. of wire rope. This hauls the loaded cars from any convenient

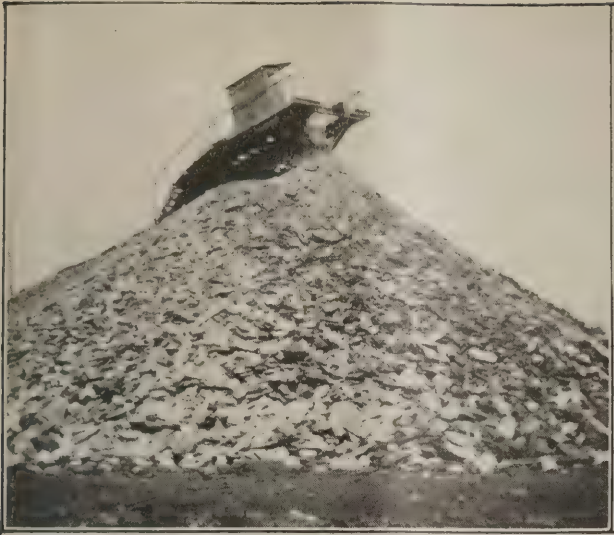


FIG. 1. FRONT OF REFUSE PILE

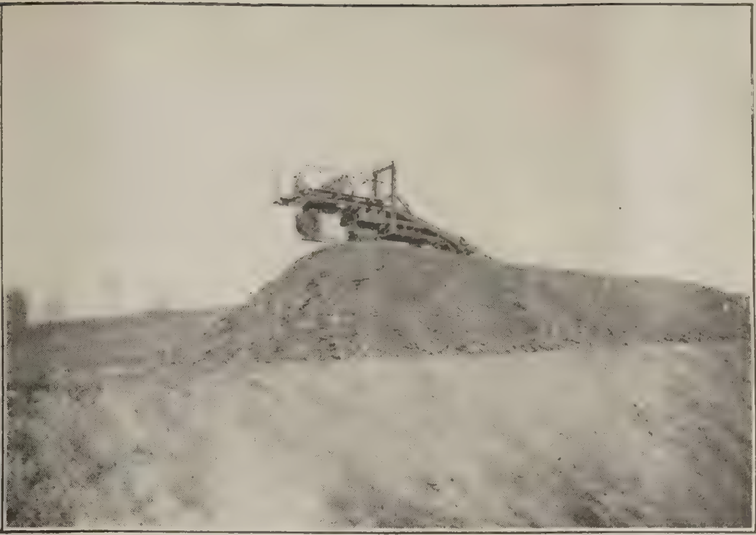

FIG. 2. SIDE VIEW OF PILE AND DUMP

point, dumps them and returns them to the empty track or place of loading.

It is possible for two men to dump slate at the rate of from 20 to 40 cars per hour. If, however, the output is small and it is only desirable to employ one man, he can handle from 6 to 10 cars per hour. In other words, the machine hauls and dumps the cars, and by its use one or two men should be able easily to handle all the slate from an ordinary mine.

These dumps may be employed on a steep incline, thus largely increasing the capacity of a given piece of property for the storage of refuse. It is possible to handle on this machine either the ordinary mine cars themselves or to use monitor cars, into which the contents of the mine cars are deposited, the monitors being hauled up the incline and emptied in a manner exactly similar to that employed for the mine cars.

By the use of this machine it is practically never necessary to employ more than two men for handling the entire output of refuse from a mine. In case the quantity of rock to be handled is small and the length of haul short, one man can easily do this work. Two operators can move the dump forward when this becomes necessary, level the roadway and build in tracks in about an hour and a half. On account of the long overhang of the machine, it is necessary to do this work of moving the machine forward to a new position only at long intervals.

The control of the machine is located at the proper place—namely, the dumping point—enabling the operator to attend to any difficulties which may arise here, such as material choking in the cars, etc. This also avoids the danger of running the car off the pile as sometimes happens when the hoisting machinery is distant from the dumping point and a code of signals is depended upon.

Many of these machines are now in successful operation, the number of cars being handled per day ranging from 120 to 265, while the weight of the loaded car ranges from 6,000 to 13,000 lb. The motor power in these installations varies from 25 to 66 hp., and the grade of the dump from 10 to 33 per cent.

Editorials

An Impending Shortage in the Middle West

One of the best-informed wholesalers in Chicago states that a close analysis of the market situation at this time shows that the retail dealers generally throughout the Western States have not received anywhere near their usual quota of coal and that shipments so far have been far below normal. This shortage will have to be made up within the next few months in order to meet the consumers' demands.

A 20-per cent. increase over the current demand will create a shortage in nearly all fields. In many cases foreign laborers have left the coal fields for their native countries, while the transportation interests have not been in a financial position to anticipate any revival of trade, and this will make the car question a serious one later. These elements are going to be the controlling factors in the coal markets during the next several months, and prices are certain to show sharp rises. The retail dealer who is prepared for a shortage will undoubtedly reap advantages from these unusual conditions.

※

Efficiency Tests as Sports

Our sports have rarely had any relation to our efficient performance of daily occupations. In fact, some will say they should not be so related and that the very thought of wedding sport with utility should perish. But after all, the evil of the association depends upon the point of view. It is dangerous to make our sports heavy with drudgery—very true!—but perhaps it is well to lighten our daily labors with the elements of sport.

If work is bending daily to an undesirable task, then 8 hr. is too long and 6 days too many in which to work, and long vacations are needed. If we are going to be wage slaves, the shorter our servitude the better; but if the day's work is for humanity or for the love of doing—for the keen joy of molding a result—then is labor pleasure and the day no longer than it is happy.

Wearisome work it is trudging along the country road, but joyous is "hiking," because hiking is a sport, while trudging is a duty. They can have discipline who will; for us the joy of doing is better.

They say that the people of these United States talk shop far more than do Europeans. They do, as anyone can verify if he will, but it is because the love of their work puts wings on their leaden feet and makes all their labors pleasures. And so shop comes naturally, as may also come efficiency. So long as efficiency—the art of securing a result without any unnecessary labor—replaces an effort of the body only by imposing a burden on the will, it will never be a success.

But success will come if we make efficient action into a sport, a thing of joy to carry into our holidays. There is no lack of examples in the past—the archer competing at the target, the soldier at the rifle butts, the blacksmith in a shoeing contest, the Australian and Wyoming experts in a sheep-shearing competition, the Western cowpuncher broncho-busting at a fair, and the confectioner engaging in a pie-baking contest.

Sports and efficiency are closely akin and not opposing ideas, as some believe. For it was from the racetrack that the efficiency experts took the stop-watch and from the recreation field the pedometer.

In what department of activity has the art of successful action been more exploited than in sports? Nowhere has the time of action been more closely recorded. Here the first photographs were taken to discover the mechanism of fast motion—to be more explicit to discover just how a horse maneuvered his feet in a trot.

Here also we find a dozen men at work with a bleacherful of critics, friendly and adverse, discussing, criticizing, denouncing their every motion. No men were ever more closely watched at their work. So also the manner of hitting in baseball has been analyzed, and the various methods of delivery. Books have been written on it and the pages of newspapers have been filled with it, and the mechanics of the curved and the spit balls has been learnedly discussed.

But of the manliest sport of all—the best because the most fruitful, the worthiest because the most universal—for this till recently there has been little of either stop watches or technique.

We blunder on to the best ways and weights in shoveling, and each for ourselves we learn how to perform the motions connected with rope splicing or carpentry. Perhaps after awhile we will put into the common round some of that keen analysis and that readiness to submit to inquiry which we already have introduced into exercises which profit little or nothing.

First-aid contests are efficiency sports, and so was the shoveling competition at the recent field day of the Colorado Fuel and Iron Co. In a social outing of the Lehigh Valley Coal Co. there were contests between miners in erecting a set of 8-in. timber, in splicing ropes and belting and in guessing the percentage of carbon in a sample of coal. Some day we will all be subjected to such tests of skill.

The editors will be writing their illuminating discourses in a one-man event with a time limit on completion, a line limit on length and a subject limit on discussion. Then even the work they have to do will be a joyance unquestionable.

By the way, the results obtained at the Lehigh Valley meet are worthy of record and the winners deserving of commemoration. August Van Blargen and Edward Dunney erected a timber set in 7 min. 34 sec. Al. Openhaus and Edward Kessler won the belt-splicing competition. An 18-ft. splice was put in a wire rope by Henry Thomas, Tim Davis, Joseph Michaels and Esther Evans in 11 min. 5 sec. John Lloyd, R. A. Marshall and Harry McClellan tied in the estimation of carbon, and Thomas McLoughlin gave an exhibition of hemp-rope repairing.

Work is not labor till sorrow goes with it, and when our minds are bent to work and our bodies inured to it, we shall find that no work is labor, so long as we are well, if only we restrict our working hours within lengths that are healthful. And pleasure in our work will always be far more effective than discipline.

⁂

New York Coal Specifications

Next week's *Coal Age* will contain an important discussion of the New York coal specifications by some of the leading members of the New York coal trade. The new specifications have come in for some more or less severe criticism, and since more coal will be handled on these than probably on any other like proposals in this country, the matter of formulating uniformly fair and practical specifications in this case is a matter of more than purely local interest. Moreover the new requirements are likely to be established as a precedent.

⁂

Prophylactic Treatment for Contagious Misbeliefs?

The freedom of the press in covers or without covers—in books or in newspapers—is a sacred order of things. It would not be well to restrain anyone from plain utterance of what he believes; but without pretending that the matter has been given the due thought such a pronouncement merits, might it not be permissible to suggest that all books, especially books of science, be submitted to some scrutinizing eye before publication, so that the would-be writer might be protected from error by his due admonishment as to what constitutes recognized truth; might also be in part defended from those savage individuals known as book reviewers who delight in straightening out erratic writers?

Surely by some such provision a lot of misapprehension might be saved from going abroad; for most of the inaccuracies which parade in open day would never have dared to fare forth in the light if some recognized authority had labeled them myths and fallacies before the public saw them and before the author committed himself irrevocably to them. Do not think for a moment that it is suggested that books be placed on an *index expurgatorius* or that no book be published till some frowsy-headed professor has written *nihil obstat* on the covers. The idea is rather that every book should be subjected to inspection and be reviewed before publication, so that the writer might be saved from mistakes.

This matter has not been duly placed before the associated book reviewers of America. It can easily be foreseen that they would condemn it unless they saw a chance to obtain a place on the prenatal book censorship. For when books are all good, the work of the reviewer is gone. Like the lawyer and the doctor who thrive on the crooked deal and the diseased body respectively, the reviewer does his best work where the volume to be described most sadly fails. But this selfish creature must not be allowed to hinder a worthy movement.

There is a class of books already which make deadly reviewing. They are issued by large publishing houses, and these corporations will not publish a book unless the author is considered competent. Moreover, the editor of the establishment exercises care, and the more obvious errors cannot find way into print. In this way the reader is protected and the reviewer disarmed. Now if only every individual with a burning desire to write had a faithful friend like the editor of a publishing house or his assistant to lead him gently from the pitfalls toward which his bleary eyesight leads him, how much better it would be for reader and author and how barren it would be for the reviewer!

⁂

Proportional Wage Increases

The agreement between the miners and the Colorado Fuel and Iron Co. about to be signed contains many excellent clauses. Among the best items is that part of the last clause which says, "If prior to Jan. 1, 1918, a general increase shall be granted in competitive districts in which the company does not conduct operations, a proportional increase shall be made" [in the schedule of wages].

This seeks admirably to meet and satisfy a difficulty before it arises, and its inclusion among the provisions is an element of real statesmanship which is only too infrequent in labor agreements. However, it would have been better had it been differently worded, and confidence may be expressed that the document will be later rectified.

Equal proportional increases are only fair between two or more districts when the wages in both or all are equal. The difficulty is not strongly marked between Colorado and adjacent states because wages are more nearly equal than among some other states and parts of states elsewhere competing, but in any event rises should not be by percentages but by cents per ton or hour.

Only when this becomes customary will the balance of power between districts be maintained. Otherwise the regions paying the larger wage will be faced by a progressive discrimination. If one district pays twice as much for labor as another, after an increase of 10 per cent. which makes, say, a difference of 10c. per ton to the region giving the larger wage, the district paying the lower rate gains an advantage of 5c. and can probably cut the more generous region out of part of its trade.

This is not just, and it really is not necessary. Let the operators this coming year make a specific raise and not an *ad valorem* increase in the rate for each form of mining. Let this be the same everywhere whether in West Virginia, Pennsylvania, Colorado or Montana. It is bad enough to face unequal rates; it is worse yet when an inequality once granted is made larger year by year. This latter condition seems now to be universally conceded, if not in principle at least in general practice.

The continued increased cost of living is going to make it necessary and just to increase wages frequently. We may easily see wages doubled in the next quarter century and the working man not a bit better off. But the change will tend to react against the states now paying the higher rates if by any means they could be made to stand it without an early bankruptcy. Suppose a rate of 26c. per ton in one state and one of 47c. per ton in another. These are doubled by inevitable economic action to 52c. per ton and 94c. The differential is now not 21c., but 42c., and a most inequitable condition has arisen.

Strange it is that this condition has not been generally understood. If it had been, the states paying the larger wage would have demanded specific raises and insisted that similar specific increases be placed on the labor bills of other states.

Sociological Department

First-Aid Meet of Susquehanna and Lytle Coal Companies

SYNOPSIS—The meet held by the Susquehanna and Lytle coal companies is marked by the warmth of its social feeling, by the assistance it gives to safety propaganda and by the originality and excellence of its first-aid work.

The first-aid meet of the Susquehanna and Lytle coal companies has an individuality of its own. It has the character of a family gathering, though only a few ladies are present. By some this social spirit is explained sufficiently by the fact that the employees of the Susquehanna Coal Co. have for the most part been with that company for a number of years, but probably this good-feeling may be better explained by saying it arises out of the same spirit which has kept so many men from transferring their allegiance from one company to another for so many years.

FIG. 1. FIELD AT SUSQUEHANNA MEET BEFORE 52 TEAMS AND THEIR 329 CONTESTANTS TOOK THEIR PLACES

One of the older employees who dug coal at the breast is Morris Williams, the president, and there is a large number of other men older by far than he who never received a pay envelope from any other company. However, the first-aid men are mostly young, and therefore the spirit animating the contestants must come less from long association than from a sentiment that the Susquehanna Coal Co. is directed by officials who have the interests of the men at heart.

Efficiency Which Does Not Effect Happiness Is Misnamed

And the estimate of the miners is not wrong, for no one could have a keener interest in their welfare than Morris Williams, R. A. Quin, General Daugherty and Charlie Gloman. And what is more, the officials do not fail to exhibit their genial comradeship, which is as important as to feel it. There are executives aplenty with a kindly disposition and a forbidding air who seem to care for nothing but efficiency. After all, efficiency is of little value unless it effects our happiness, and somehow these otherwise excellent executives do not appear to have just that particular kind of efficiency in view.

The Susquehanna and Lytle coal companies' meet was held at Edgewood Park, near Shamokin, Sept. 25, and special trains were run from various points to gather up the contestants scattered about the anthracite region. Despite the fact that the men come from widely remote sections of the anthracite field, the meet nevertheless resembled a reunion.

One of the interesting features was the number of boys' teams—breaker boys from No. 5 Nanticoke, No. 7 Nanticoke, No. 6 Glen Lyon, Hickory Ridge colliery, Shamokin; Pennsylvania colliery, Mt. Carmel; Lykens, Williamstown and Minersville. Thus there were eight teams in all. The boys took part in the same events as the men except in the full-team event, and their marking was uniformly high. They received the greater part of the applause, and well they deserved it as their work was most creditable.

Some of the Safety Mottoes Exhibited

The Susquehanna and Lytle coal companies had this year, as last, an exhibit of safety methods. Many of the legends on the display cards exhibited were extremely valuable, and it may be well to repeat them here:

> The best safety device is a careful man.
>
> It is better to be always careful than always a cripple.
>
> Lodge men should boost for safety. Every lodge man is pledged to protect his fellow lodge man and to look after his wife and children if he is killed. Isn't it a more sane and fraternal act to prevent a brother from being injured than to buy flowers for his funeral and give charity to his family after he is gone? Think this over and join the safety campaign.
>
> You need two eyes. It is a common sight to see a man take a match and a soiled handkerchief and dig a particle of steel out of the eye of another man. Think of exposing one of the most delicate and valuable organs of the body to the microbes which infest the handkerchief. There is always danger of infecting the eye, and blindness may result. Your eyes are the most valuable asset you have. Treat them decently.

Beside these were several blue-printed line drawings showing trucks for use in shaft sinking, a parallel-throw switch for mine tracks and a new method of timbering

steep workings which is known as a "man catcher." By means of planks set clear across and entirely over the manway at each "heading," or crosscut, a man when falling down from the breast is prevented from dropping or sliding to the bottom. By this means his life is probably saved. The men can pass around these man catchers when they climb into their places. This system is used with the full battery, the miner standing on the coal when drilling his chamber breast.

Several photographs were also shown exhibiting the changes in methods by which safety is being secured: Mules equipped with Wico lamps, shot firing with a battery, locking device for cage fans or keeps, safety doors over a shaft which is being sunk and many other like devices. There were also several iron cots made from screen cloth and used in the underground emergency hospitals and stretchers devised for handling men in heavily pitching seams. These were provided with a hook at the upper end and straps by which the injured man could be firmly secured in place.

Especially interesting were the views of the gardens of the workmen. The movement has not been encouraged by the Susquehanna by the award of prizes. The self-esteem of the Susquehanna men has always been

enough to carry the movement along. The company engages a most capable photographer to take large pictures of the gardens, and these photographs are given to the tenant of the lot and he keeps them in remembrance of his success long after a $10 or $5 bill, had he received it, would have been spent and forgotten.

Problems in the First-Aid Contest

The morning events were as follows:

One-Man Event—After a premature blast, a man is found with both eyes filled with dirt and a wound on the chin. Lead to a place of safety and dress injuries. Time, 5 min.

Two-Man Event—Simple fracture of the fifth and sixth ribs, right side; laceration of all the fingers of the left hand. Use roller bandages for the fingers only. Time, 12 min.

FIG. 8. GLEN LYON BREAKER BOYS' TEAM

Three-Man Event—Compound fracture of the middle third of left arm, simple fracture of same forearm and compound fracture of the middle third of right thigh. Time, 15 min.

Special One-Man Event—Best original adaptation of one or two triangular bandages for any purpose whatsoever.

The special event introduced many new dressings. William Penn inside team, for instance, exhibited a dressing for a fracture of the forearm using only one triangular bandage. The triangle was slashed on each side by seven cuts parallel with its base. These were extended till they nearly met along the median line of the triangle. The slashes, however, left an undivided midrib to the bandage, as shown in the illustration. This was about 2 in. wide. The seven ends of one edge of the triangle passed around the splints, and being tied to the seven ends opposing them, secured the broken arm of the injured man. The work was rapid and neat and occasioned much favorable comment.

Full-Team Events Are Held in Afternoon

After a splendid lunch served under the trees in the park the full-team event was contested. This was as follows:

Men's Full-Team Event—Compound fracture of the left leg; dislocation of the right hip, laceration of the sole of the right foot, bleeding in spurts. Time 20 min.

Boys' Full-Team Event—Fracture of the pelvis: with lacerated wounds of the side of the head, bleeding in spurts. Time 12 min.

Two illustrations, Figs. 3 and 7, are shown of the first-mentioned event, which was performed concurrently with the second. The fractured leg will be noticed carefully "pillowed" on a blanket and lying just in position in which it was found. The slotted boards lying on the stretcher will also be noted in one of the illustrations. Bandages are passed through the slots and they are then firmly secured around the handles and to the cleats at the side. As a result the patient is most securely attached to the stretcher, and the men could hardly be more effectually prevented from sliding were they slung from the stretchers exhibited by the company and reproduced on the accompanying illustration. The stretcher bearers—boys and men—"looped the loop" with their "victims" without loosening the bandages.

The Richards outside team from Mt. Carmel, Penn., had hoped to get the event which was apportioned to the boys, for they felt they had an X-bandaging for the pelvic injury they would like the *Coal Age* readers to see. So when all the events were over, Dr. J. M. Maurer consented to their dressing this fracture, with the result illustrated. The work was certainly admirable in every way—as good and as professionally sound as it looks in the illustration. All knots which could press on the body and injure by constant pressure were padded, and where the bandages crossed on the chest a heavy pad was placed to relieve that pressure. It was perhaps unfair to photograph the men in this event, because all the breaker boys' teams in the regular contest did the work so admirably.

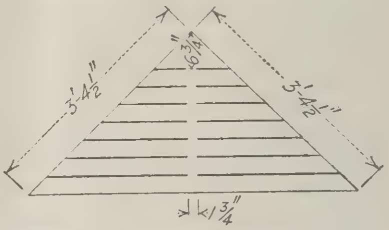

FIG. 9. SINGLE TRIANGULAR BANDAGE SLIT FOR USE IN BANDAGING FOREARM

Perhaps the principal improvement in the first-aid work was in the execution of it rather than in the final result—the "how" which is as important in every way as the "what." A man may be well bandaged, but how much good results if he has expired the while from shock which might have been avoided, or what if the fracture he had sustained had been made worse by careless action, or what if his spine had received an unnecessary twist? This part seems to be more emphasized now than ever, and the Susquehanna men and boys were just as careful in doing what the judges were not able to see as in performing the parts of the work to which the judges could give their attention when they made their rounds for examination.

FIG. 10. LUKE FIDLER AMBULANCE

They do not push bandages by hand under the prone victim, but use a paddle so that he is but little disturbed by the action. Where it is necessary to draw out the tongue they grasp it with an ordinary music clasp, built like a blueprint clamp but lighter. The pressure of this can be regulated at pleasure. Attached to this is a plummet. This holds the tongue out, and a little stick with a Y-shaped cut on top and bottom is thrust between the teeth to keep the mouth open and protect the protruding tongue.

After a parade came the speech-making, which was editorially treated last week, though nothing was said of the address of Henry A. Fuller, president judge of the Luzerne County Court at Wilkes-Barre. It was extremely witty and entertaining and pleased everyone. However, Judge Fuller undertook to contrast the war in Europe with the first-aid, mine-safety and compensation here to the disadvantage of Europe and our own private exaltation. Our present peace and noble ameliorative work are comforting reflections truly, but when we think that the three things Judge Fuller commented on arose abroad—in England and Germany—and that we ourselves have had wars which we are quite willing to believe showed a creditable spirit, such self-complacency seems at best hyprocritical and quite out of keeping with our national spirit of fairness.

Roster of the Victors in the First-Aid Contest

The winners of the one-man event were the outside team of No. 1 Pennsylvania colliery first and that of No. 2 Hickory Ridge second. The inside team of Hickory Ridge took first place in the two-man event, and the outside team of William Penn colliery took second place. In the three-man event the outside team of Hickory Ridge was first, and Nanticoke No. 7, No. 1 North shaft, was second. In the special one-man event Nanticoke No. 5, No. 4 slope, was first, and Pennsylvania colliery outside team was second.

The full-team event went to Hickory Ridge outside team, with Pennsylvania colliery slopes Nos. 1 and 5 second. The breaker boys at Pennsylvania colliery took first place, and the Hickory Ridge breaker boys came second. Hickory Ridge had only three teams, but they took three first places and two second, and none of the three teams failed to receive honors.

The winners of the full-team event—Hickory Ridge, outside team—were P. H. Maginnis, captain; Charles Williams, John Ginter, Peter Aleria, Joe Stanshock, Henry Willard and Dave Little, subject. This team was awarded a silver cup and gold watch fobs. The members of the team of Pennsylvania colliery, slopes Nos. 1 and 5, were William Matthews, captain; Ralph Kendter, Anthony Zigray, Andrew Sadusky, Felix Pfeifer, Joseph Graff and Albert Evans, subject. The breaker boys in the Pennsylvania colliery team which took first prize were Methuen Watkins, captain; Bernard Moleski, Edward Purcell, William Hovenstine, Gerald Wolfgang and Robert Penman, subject. The boys in the Hickory Ridge team were Patrick Feori, captain; Russel Tasker, August Little, Lewis Lish, Frank Alerio and Michael Spock, subject.

The judges were Dr. J. B. Rodgers, of Pottsville, Dr. D. H. Lake, of Kingston, and Dr. James W. Geist, of Wilkes-Barre. Dr. J. M. Maurer was the surgeon in charge of the field and as usual handled the work most successfully. Charles K. Gloman, secretary of the Susquehanna Coal Co., had charge of all the arrangements. The Elmore band supplied the music. John Dorsey, 11 years old, who is a member of that organization, played an admirable cornet solo and received liberal applause. The Susquehanna Coal Co. Glee Club was present with a piano and, led by Prof. K. I. Hopwood, gave several excellently rendered selections.

⁂

Western Fuel Co.'s Picnic

The Western Fuel Co., of Nanaimo, Vancouver Island, B. C., held a picnic at Departure Bay on Aug. 12. The weather was all that could be desired, and the surface and underground employees put forth every effort to make the excursionists happy. The committee in charge can justly feel proud, for over 2,000 persons attended, and every one voted the event a great success.

For this reason it is proposed to repeat it annually. Such days of social intercourse between employer and employee do much to make both approach their inevitable differences in a more friendly spirit. Not only the employees' committee, but the underground manager, the superintendent, and the general manager, T. R. Stockett, spared no effort to make the day pleasant.

LOADING THE FERRY FOR ADVENTURE BAY

DR. McLENNAN ADDRESSING THE CROWD

The company's new ferry and several launches carried the passengers to the scene of merriment at Departure Bay, a distance of 4 mi. Ice cream, soft drinks, oranges and peanuts were provided in abundance. In the afternoon sports were held and valuable prizes awarded for each event.

Probably the most interesting item on the program was the first-aid contest, which was won by J. W. Jemson. The single event was: Run 100 yd.; treat a patient for fractured jaw, scalp wound and crushed hand; lift patient by fireman's lift and carry back to starting point.

Another interesting and keenly contested competition was the tug-of-war between the tophands and underground men. After several animated pulls the underground employees were awarded the prize. During the day a number of selections were rendered by the Piper's Band and members of the Silver Cornet Band. Speeches were also delivered by A. E. Planta, the mayor of Nanaimo; T. R. Stockett, general manager for the Western Fuel Co.; A. S. Hamilton, and Rev. Dr. McLennan. In the course of Manager Stockett's remarks he promised for his company to give dollar for dollar or gun for gun for every dollar or gun that the employees subscribed toward the Canadian Gun Fund.

Discussion by Readers

Efficient Mine Foremen

Letter No. 4—Mining is considered one of the most hazardous of occupations, and to reduce these hazards to the lowest possible limit, both the State and Federal Governments have assumed to exercise authority over the operation of mines, to the extent of enacting laws that, if enforced, will increase the safety of mine workers. These laws require the periodic inspection of mine workings and mine equipment by competent men commissioned by the state for that purpose.

The enactment of laws or the making of rules and regulations assumes the authorizing of persons whose duty it shall be to see that such laws, rules and regulations are strictly enforced, and the responsibility for the safety of workmen then properly rests on such authorized persons.

In considering where responsibility for the safe operation of a mine rightly rests we must first look to the mine superintendent. The law recognizes his authority by making him responsible for the employment of a practical and competent mine foreman who is to have full charge of the underground operations. Then, in order to fix a standard of competency for candidates for that position, the law requires that a mine foreman shall hold a certificate issued by the state to persons who fulfill the requirements of the law and pass an examination in respect to their knowledge and experience in the operation of mines. These are the general requirements relating to safety in mining.

The laws of most coal-producing states specify in detail the actual duties of the mine foreman and require that he shall devote his entire time to the operation of the mine in his charge. In most cases the mine foreman is made personally responsible by law for all matters pertaining to the safety of the men in his charge. The question has been raised as to whether the mine superintendent should not also hold a certificate of competency. While this would undoubtedly prove an advantage in the operation of the mine, it does not seem to me necessary to make it a requirement of the law wherever the act holds the mine foreman responsible for the safety of the operations underground. In my opinion it is not a good plan to make two men responsible for the same thing. The better plan is to make the mine superintendent responsible for employing a competent foreman, and then hold the foreman responsible for the safe operation of the mine, by specifying in detail what are his legal duties in the operation of the mine.

Let me now ask, What makes an efficient mine foreman, and how much should he know? There is scarcely a position in any industry where so many lives depend on one man's conscientious attention to duty, as well as on his practical and theoretical knowledge of the conditions relating to his work. Any man may do the best he knows how, but if he permits a danger to exist by reason of his ignorance of conditions, the result will prove fully as fatal as though he neglected a known duty.

The increased application of modern methods and equipment in mining and the greater development of the mine increase, in the same ratio, the required standard of proficiency, and it is necessary to consider these increased requirements in determining the competency of men capable of taking charge of the work. I would like to ask further, What is to be understood by the term "practical experience"? Many seem to think that this term relates only to the actual performance of work for a certain time in the mining of coal, without respect to the extent of the man's knowledge and his degree of efficiency as a workman. I know some old mine foremen who went to Pittsburgh to observe the experiments performed by the Bureau of Mines and learn that coal dust would explode without the presence of gas, before they would believe that to be possible.

To my mind the most practical man is the man who combines in his experience both years of work and of study. His years of work in mines will make him a judge of what he reads and studies. It is unfortunate that there is much in mining books that must be culled, the good from the bad. But reading and study keep a man posted and well informed on mining conditions and make him a more competent and efficient foreman, whose services will prove increasingly valuable to the company as time passes.

A mine foreman should consider that he must continue to study after he has secured his certificate. We must all admit that there is much to be learned that as yet we do not know. An efficient mine foreman will recognize that any amount of law or inspection cannot keep a mine safe. For this reason the foreman has a much greater responsibility resting on him than simply to keep the letter of the law. He knows that "a chain is only as strong as its weakest link," and one careless man in a mine may jeopardize the lives of every one underground. The foreman must be able to detect this weak link.

If a foreman finds a man who will not exercise the necessary care and precaution, he must discipline him. It is not enough to remind him of the law and expect his compliance therewith. When a foreman discovers a piece of bad top in a man's place, it is not enough to tell him to set a post under it, but he must adopt measures that will induce the man to carry out his orders promptly. This can only be done by discipline for failure. Strict mine discipline is the greatest factor in averting mine accidents.

Human fallibility and human carelessness make accidents possible at all times, and an efficient mine foreman will always consider these elements. It is more important to keep the mine free of dust and in such condition that a possible local explosion of gas will not be propagated throughout the mine, than to devote one's whole energies to the prevention of windy and blownout shots. It is better to keep sufficient air in circulation at the working face to prevent an accumulation of gas, than to rely on men not passing over a danger board and igniting the gas with their open lamps. It is better to set the necessary post promptly, than to continue to load coal and hope to dodge the loose piece of slate when it falls. At the same time, the windy or blownout shot, the danger board or signal and the need of watching the roof must not be neglected. In respect to safety, these are the chief essentials of an efficient foreman. Besides these, however, the efficient foreman must be able to get out the coal systematically and without waste of coal or danger to the workmen. I have confined my remarks to the safe operation of the mine.

George Stockdale.

Mt. Braddock, Penn.

Letter No. 5—In connection with the discussion of what makes an efficient mine foreman, I have been wondering whether it always pays for the foreman to speak the truth when questioned by the superintendent or manager in regard to conditions in the mine or occurrences that take place in its daily operation.

I recall one little incident that convinces me that it always pays a mine foreman to speak the exact truth and explain matters as they are or as they occur in the mine. The case to which I refer was one in which there had been heavy rains and surface water had found its way into the mine, so that it was necessary to discontinue work in certain places. As a natural result the general manager became very anxious to know the exact condition and, going into the mine, he put up a mark showing the water level, and gave orders that this should be measured night and morning.

It was my duty to take the measurement every night, and on going into the office one night after having measured the water, I found the manager and foreman in the office. The first question the manager asked was, "How much has the water gone down tonight?" I replied, "Two inches." The manager at once jumped on me, claiming that I had never measured the water, as the foreman had just told him that it had gone down 6 in. below the mark.

Naturally, I did not want to get the boss into trouble, but felt sure that he had made this statement as a guess at what he thought the water ought to have been lowered. I did not believe that he could have measured the water himself. Realizing that he had more to lose than myself, I stated: "Perhaps I have made a mistake in the measurement." As might be expected, such a reply did not give me much standing in the eyes of the manager, but my own conscience was free. The incident impressed me with the thought that if I ever became a mine foreman I would speak the truth. I believe that a mine foreman should always be able to give an intelligent answer in regard to conditions in any part of the mine—certainly this is true of every efficient foreman.

My observations during many years of coal-mining experience lead me to conclude that the trouble with most mine foremen is that they spend too much time in one place. Then if the superintendent or manager inquires about a place they have not reached in their rounds, they do not like to acknowledge that they have not seen the place, but make a shrewd guess and depend on having the assistant foreman put in a couple of men at once in such a place and see that it is put in the shape that he has described.

Instead of such a condition of affairs, I think there should be the best of understanding in the world between the mine foreman and his superintendent. When this is the case the foreman will not dread the superintendent's visit to the mine or strive to avoid his going into certain places while he is underground. A foreman should not hesitate to tell his superintendent of rails that had been covered by a fall, since it is necessary that such material be accounted for in the monthly report.

One thing a mine foreman should remember is that he is not infallible. Some of his schemes, no doubt, will not work out as he expected. Then what is the use of telling the superintendent, "Everything is working fine," when in reality the foreman is spending the company's money in a fruitless endeavor to work out his scheme and prove that he was not mistaken in his ideas? At such a time a dishonest mine foreman will frequently report the expense on other items. Since the superintendent does not have the opportunity to personally observe what is going on in the mine, it is important that he should have a mine foreman on whose word he can depend, and this sort of man, I believe, will make the most efficient foreman in the end.

Thomas Hogarth.

Burgettstown, Penn.

Letter No. 6—I have been much interested in the discussion of Efficient Mine Foremen, and would like to refer to a few points that appeal to me as going to make up an efficient foreman in coal mining. I will refer to these briefly, as follows:

It must be clear to the close observer that the mine foreman holds a most important position as an intermediary between two conflicting interests engaged in the mining of coal. Also, as a result of these conflicts, there is produced much suffering on the part of the general public. Standing as he does, the mine foreman is in a position to minimize the differences that are wont to arise between miners and their employers. By virtue of his position, the foreman if broadminded can see at a glance both sides of the question in controversy. His daily touch with both the miners and the operators informs him of any approaching disagreement or trouble, and if he is a man of judgment, he can generally bring both sides to a reasonable understanding of their individual rights and destroy that prejudice which so frequently exists in the minds of parties whose interests are in conflict.

The mine foreman must always hold sacred the rights of the miner to a sanitary condition of the mine workings in which he is employed and to the equipment of the mine with all necessary safety appliances designed to reduce the frequency of mine accidents of every nature. The mine worker has a right to fresh air and good drainage in the mine, so far as this is practicable. On the other hand, the operator has the right to expect the highest efficiency in the workmen employed and a maximum of economy and minimum of loss in the operation of the mine.

The general public also has unquestioned rights dependent on the continuous operation of the mine, the avoidance of strikes or lockouts, and a reasonable market value of the products mined. The intelligent mine foreman must be thoroughly informed in regard to and consider all the rights of the several parties involved.

I grant that it is often a difficult matter to bring parties in conflict to see each other's rights, but this is the task of the intelligent mine foreman and one that is of the highest importance. He should be possessed of a strong conviction that true rights of individuals never clash. His greatest efforts should be put forth to show both parties that their interests are not antagonistic but common.

In order to do the most efficient work in this connection, the mine foreman must not be one-sided. We speak of educated mine foremen, but if education means anything in this connection it means the ability to see the right of both sides of a controversy. The power to do this does not come from a college education; it is developed by keeping a well-balanced mind that can weigh the arguments on both sides of a question. An unprejudiced mind is developed by mixing freely with all classes of people and gaining their viewpoints as they present them. It is the result of reading and studying a question from an unprejudiced standpoint.

Different people regard the question of education from different standpoints, but in respect to the education of mining men, it must fit them for getting results in the business in which they are engaged. Doubtless, in many minds, the education of a mine foreman suggests his capability to operate the mine and avoid the loss of human life. In the minds of others, it suggests the ability to operate a mine in the most economical manner and reduce the cost of the production of coal. While I have not investigated the causes of mine catastrophes that have shocked the world, I strongly suspect that a large percentage of these accidents might have been prevented had the mine foremen in charge possessed the intelligence and experience that would have enabled them to form an accurate knowledge of the conditions existing in the mine and their effects.

I concede readily that the chief cause of mine accidents in the United States is to be found in the carelessness and ignorance of the miners themselves. In view of this fact, the responsibility of the mine foreman is greatly increased. A person fitted for this position must therefore be a good judge of human nature, possessed of tact and of a practical turn of mind. He must be thoroughly posted in the requirements of the state mining laws. He must be firm in maintaining the discipline of the mine. His technical education, whether derived from reading and studying or from attending schools, should include a thorough knowledge of the elements of mathematics and physics. Although the latter term may frighten many men, the laws of physics are simple natural laws that control the ventilation of the mines, the accumulation of gases, the rise and fall of the barometer, the initiation of a gas or dust explosion and many other things connected with the operation of the mines.

An efficient mine foreman must also possess a knowledge of the human frame and anatomy. He should know the exact position of the vital organs of the body and be acquainted with first-aid and rescue work, including the use of rescue appliances. He should have a sufficient knowledge of the origin and formation of coal and the structure of rocks to guide him intelligently in the extraction of the coal from the seam. His experience must be such as to acquaint him fully in regard to the preparation of shots in blasting coal and rock, timbering airways and working places to make them safe, the fighting of mine fires and the operation of different haulage systems underground.

Although these are only a few of the things that a mine foreman should know, some will say that I expect too much of the man in this position, claiming that he often works for less wages than the miner at the face. In reply to this assertion, I will say that mine operators can well afford to pay good salaries for well-informed mine foremen. I recently heard a mine operator remark that his company would be glad to pay a foreman who was educated in the manner I have described a salary of $2,000 per year. Operators know better than anyone else that intelligent labor pays, and they are willing to pay the price for such efficiency.

MINE FOREMAN.

Percy, Penn.

⁂

Egyptian State Ry. Specifications

Letter No. 2—The points made by F. R. Wadleigh in his letter, *Coal Age,* Oct. 2, p. 559, against the editorial of Aug. 28, p. 344, do not seem to be particularly well taken nor are they such as would ordinarily occur to a reader conversant with the coal trade.

The strike clause, for example, does not seem to be less rigid because it "allows an extension of time for deliveries." Had an American shipper entered into such a contract for the period Apr. 1, 1915, to Apr. 1, 1916, and were he confronted now with a strike or other unforeseen contingency, he would be required to make good his tonnage after Apr. 1, 1916, during a period when conceivably the cost of mining might well be much increased. Of course there could be no cancellation until after "an actual suspension of shipments," were there any equity in the case; but another clause points out that rejection is to constitute nondelivery.

That brings us to "the judgment of the buyer." The evidence of strike or other contingency has to be "satisfactory," and as Mr. Wadleigh says, Egypt is a long way off. Deliveries are to be "as per the following tables at the option of the administration"; and subject to 30 per cent. increases. Deductions, etc., are to be decided by the administration; and as already mentioned, rejection on the point of quality would constitute nondelivery. With American coals so generally friable and so much complained of in Europe for their proportion of slack, it is easy to see that "the inspector" with the weight of the British Government at his back could make the contractor very uncomfortable.

An absolute limit of 40 per cent. for volatile may certainly be considered rather stringent. There are several good locomotive coals that range around 40 per cent. volatile, almost as often above as below. There are any quantity of analyses from the Redstone seam that run 40.5 to 42 per cent. Under these stipulations such a coal would frequently be subjected to rejection. Because 40 per cent. will include everything from the Durham gas-coal field or from the fields shipping via Cardiff, it is simply a case where such contracts should be further modified if American competition is desired. One cannot consider 6-per cent. ash with no penalty up to 8 per cent. as other that an 8-per cent. requirement, and it would be universally so regarded; and it certainly is not an exacting requirement.

The strike clauses, etc., and the requirement as to volatile, however, seem to fully warrant the use of the words "rather drastic."

The remarks on time allowed for loading at Welsh ports were simply "free comment," pointing out the contrast between their handling of coal and ours. The "running hours" are of course figured from the time the vessels are "ready to load." But our steamers would have to get higher freights than they do in ordinary times if 200 hr. were customary loading dispatch for a 7,000-ton ship. Of course we are not discussing abnormal strike periods. The same remarks apply to the 700-ton per day guarantee for discharging, weather permitting, etc. If Americans were sending 8,000-ton ships regularly in usual times, the chances are they would insist on compensation if there were 15 days' detention; that is, they would unless they put their prices at a prohibitive level.

It is true, freight quotations to the Mediterranean are not as high now as when the editorial was written, early in July. But rates to Alexandria would certainly not be much less, were one to speculate on them to May or June, 1916. The one American shipper who positively obtained any share of this business, 60,000 tons, is understood to have bid $14.16 delivered, and this on a coal that sells normally at $2.40 to $2.50, three-quarter screened, f.o.b. Philadelphia.

True, the bidder on the Panama R.R. contract puts up a bond of $30,000, but the check with his bid is only for $1,000 and the tonnage is 500,000 to 600,000. On 60,000 tons the Consolidation Coal Co., according to the stipulations, would be required to put up something like $17,000 with its bid and increase it to $85,000 when the tender is accepted. We do not understand how this can be considered other than "excessive."

We do not understand why there were "many" American shippers bidding. A London house put in a bid on American coal, but there was no award to any Americans except to the Consolidation, and that company has two steamers now just about ready to engage in this business—steamers contracted for before the war. The first of these cleared from Baltimore Sept. 30.

The whole point is that while the conditions on such pieces of business have already been modified somewhat in order to encourage American shippers, the modifications have not yet gone far enough. It was of course generally known that the Consolidation has had some business in Alexandria for a year or two back, but it was experimental by both parties. It was purely a result of those trial shipments that the conditions have been modified as much as they have.

LOGARITHMS

The treatment of logarithms here will be simple and practical and such as to enable their use to be clearly understood. Much time and labor are saved when multiplying and dividing, or when extracting the roots of numbers, or raising a number to a given power.

Definition—The logarithm of a number is the exponent of the power to which it is necessary to raise a fixed number called the **"base"** to produce the given number.

Systems of Logarithms—There are two systems of logarithms in use: 1. The Briggs or **common system** employs 10 as a base. 2. The Naperian or hyperbolic or **natural system** is derived from 2.71828+ as a base. The common logarithms (log) are those generally used, while the natural logarithms (nat. log) are often employed in theoretical analyses.

The Naperian or natural logarithm of a number can always be found by multiplying the common logarithm of the number by 2.302585, which is expressed thus:

Nat. log. = 2.302585 *com. log.*

In any system of logarithms, the logarithm of 1 is zero, and the logarithm of the base of the system is always 1.

The Logarithm—Every logarithm is composed of two distinct parts separated by a decimal point. The number preceding the decimal point, or the integer of the logarithm is called the "characteristic," while the decimal portion of the logarithm is the "mantissa." These two parts of a logarithm must be regarded separately. The mantissa is always positive, but the characteristic may be either positive or negative, according as the given number is greater or less than 1, in a system whose base is greater than 1.

The **characteristic** is always 1 less than the number of figures in the integral portion of the given number; or 1 greater than the number of ciphers following the decimal point when the given number is wholly decimal. In the former case the characteristic is positive; in the latter case it is negative. The following examples will make this clear:

log 325.00 = 2.51188 log 0.325 = —1.51188
log 32.50 = 1.51188 log 0.0325 = —2.51188
log 3.25 = 0.51188 log 0.00325 = —3.51188

The **mantissa**, as is readily observed from the above examples, is determined by the sensible figures of a number, without regard to the decimal point. Also, the mantissa of the logarithm of a number is unchanged when the number is multiplied or divided by 10, 100, 1,000, etc. For example, the mantissa of the logarithm of 3, which is 0.47712, is the same for 30, 300, 3,000 or for 0.3, 0.03, 0.003, etc.

A table of the common logarithms of numbers from 0 to 10,000 will be found in the appendix. In this table the mantissas only are given and, to avoid unnecessary repetition, the first two figures are not repeated, but bars are employed to mark the division The numbers are given in the left-hand column, and the differences, which are used for the purpose of interpolation, are placed on the right

The Coal Age Pocket Book

To Find the Logarithm of a Number—From the table of logarithms, find the mantissa corresponding to the given number, ignoring the decimal point. To do this, the first three figures on the left of the given number are found in the left-hand column of the table, and the fourth figure in the line at the top. The required mantissa is then taken from the line and column thus indicated.

But if the given number contains five or more figures, write the excess figures as a decimal and multiply by the difference found in the right-hand column of the table; point off and add the integral portion of this result to the mantissa already found. If desired this logarithm can be extended by annexing the decimal portion of the same result, but this is not commonly necessary.

Having found the mantissa, prefix a decimal point preceded by a characteristic one less than the number of integral figures in the given number. If there is but one integral figure the characteristic of the logarithm will be zero.

If the given number is a decimal, having no integral figures, the characteristic will be negative and numerically one greater than the number of ciphers that follow the decimal point.

Illustrations—The following examples will illustrate the method of finding the logarithms of numbers under different conditions and make clear the use of the table.

1. Suppose it is required to find the logarithm of the number 4,657. Opposite 465, in the column under 7, is found 811, and this annexed to 66 found at the left gives for the mantissa of this number the decimal 0.66811. The characteristic, in this case, is 3, since there are four integral figures in the given number. Hence, log 4,657 = 3.66811.

2. To find the logarithm of 32.567, ignoring the decimal point, opposite 325, in the column under 6, is found the mantissa 0.51268; but there is still another figure 7 in the given number. Therefore, to complete the mantissa write this as a decimal 0.7 and multiply by the difference 14 found in the right-hand column; thus, 0.7 × 14 = 9.8, or say 10. Then 51,268 + 10 = 51,278 and the complete mantissa is therefore 0.51278. In this case, the given number contains but two integral figures, which makes the characteristic 1; hence, log 32.567 = 1.51278.

3. To find the logarithm of 0.509065, ignoring the decimal point, opposite 509, in the column under 0, is found the mantissa 0.70672. To complete this mantissa multiply the remaining figures of the given number, written as a decimal, by the difference 8 found at the right, and add the integral result to the mantissa already found.

Thus, 70,672 + 0.65 × 8 = 70,672 + 5 = 70,677.

Now, since the given number is a decimal, the characteristic of its logarithm is negative; and its numerical value is 1, as there are no ciphers immediately following the decimal point. The complete logarithm is, therefore, log 0.509065 = —1.70677, which should be written thus $\bar{1}.70677$, since the characteristic only is negative.

Inquiries of General Interest

Formulas for Weight of Air

I have been studying the pamphlet, "Practical Mine Ventilation," and see that the formula given for finding the weight of a cubic foot of air at a temperature t and a barometric pressure B uses the constant 1.3273, instead of the constant used in the old textbooks, 1.3253. I believe that it has been explained in *Coal Age* that this change of constant is due to adopting 460 as the absolute zero of the Fahrenheit scale, instead of 459 used in the old formula. I believe it was stated that these two formulas give practically the same results.

However, I have calculated the weight of 1 cu.ft. of air at a temperature of 60 deg. F. and a barometric pressure of 30 in., and find a little difference. My calculations are as follows:

$$\text{Old formula,}\quad w = \frac{1.3253 \times 30}{459 + 60} = 0.076607\ lb.$$

$$\text{New formula,}\quad w = \frac{1.3273 \times 30}{460 + 60} = 0.076575\ lb.$$

Kindly explain which of these formulas gives the nearer approximation to the correct weight of air.

W. T. Jenkins.

California, Penn.

It will be observed that the results obtained by the correspondent are practically identical to four decimal places. In order to answer the question of which of these results approaches more closely to the actual facts, we must go back to the determinations of the weight of air made by Regnault, which have been generally accepted as the base of scientific calculations. (See "Mine Gases and Explosions," Beard, pp. 75-78.)

The experiments of Regnault showed that 1,000 c.c. of air at a temperature of 0 deg. C. (32 deg. F.) and a barometric pressure of 760 mm. (29.925 in.) weighs 1.293187 grams. Reducing this standard weight of air to pounds per cubic foot, we find that 1 cu.ft. of dry air at a temperature 32 deg. F. and a barometric pressure of 29.925 in. weighs 0.080728 lb.

Now correcting this last result for temperature and pressure, the weight of 1 cu.ft. of dry air at 60 deg. F. and a barometric pressure of 30 in. is

$$w = 0.080728\,\frac{460 + 32}{460 + 60} \times \frac{30}{29.925} = 0.076575\ lb.$$

This shows that the new formula gives the closer approximation to the truth, or the adopted standard of Regnault.

The formula used in steam-engineering practice gives the weight (w) of 1 cu.ft. of dry air at an absolute temperature (T) of the Fahrenheit scale and a pressure (p) in pounds per square inch as

$$w = \frac{p}{0.37\ T}$$

Since the weight of 1 cu.in. of mercury at a standard temperature of 32 deg. F. is 0.4911 lb., it is observed that the constant 0.37 exactly corresponds to the constant 1.3273; thus, 0.4911 ÷ 1.3273 = 0.37.

Weight and Pressure of Gas

Suppose we have a room containing 1,000 cu.ft. of pure marsh gas, having a specific gravity of 0.559. Assume, for the purpose of argument, that this gas is distributed over an area of 100 sq.ft. in the room. Since we have had quite an argument as to what pressure this body of gas would have on the mine roof above it, under the assumed conditions, I would like to ask you to explain what is the weight of this amount of gas and what amount of air weighing 0.0766 lb. per cu.ft., would the gas balance? Also, assuming there was a slip in the roof, forming what the miners call a "pot hole," would the pressure of the gas have a tendency to keep the rock from falling? Please show how to find the lifting power of this gas.

Inquirer.

Enterprise, Iowa.

The question as to the pressure this volume of gas would exert to oppose the tendency of the roof rock to fall cannot be considered a practical question under the assumed conditions. Taking the weight of the gas as 0.0766 lb. per cu.ft., the entire weight of gas assumed is 1,000 × 0.0766 = 76.6 lb. The inquiry assumes that this gas is distributed over an area of 100 sq.ft. of room, which condition makes the vertical depth of the entire volume of gas 1,000 ÷ 100 = 10 ft. Now, assuming a level seam, there is a lack of balance between this 10-ft. head of gas and a 10-ft. column of air. If the conditions were such, practically, that these opposing air columns could be held intact, the excess in weight of 10 cu.ft. of air over 10 cu.ft. of gas would represent a pressure of $10 \times 0.0766\ (1 - 0.559) = \frac{1}{3}$ lb. per sq.ft. exerted against the roof.

However, such cannot be assumed as the practical condition, as the tendency of the gas accumulated in the room is to diffuse into the air with which it is in contact. Actually, the heavier air works under the gas and forces it to flow out of the room along the roof of the mine. There is therefore an inflow of air along the floor and an outflow of gas at the roof of this room. As a fact, under these conditions there is no pressure whatever exerted by the gas in opposition to the tendency of the roof to fall. The natural escape of the gas from the room, as described, prevents it from exerting any pressure against the roof.

In answer to the last question, it may be stated that the lifting power of any volume of gas, as estimated from its specific gravity referred to air as unity, is found by multiplying 1 minus the specific gravity of the gas by the weight of a cubic foot of air, and that product by the volume of the gas in question. The result gives the lifting power of the gas when confined in a body, as in a gas bag.

Examination Questions

Alabama Examination for Mine Foremen, July 26-29, 1915

(*Selected Questions*)

Ques.—If the ventilation of a mine is insufficient, how may it be increased without increasing the power?

Ans.—All airways should be thoroughly cleaned up and every obstruction to the free passage of air removed. Air courses should be straightened, the distance the air must travel shortened and the air current split, wherever it is practicable to make these changes. The splitting of the air current, however, is limited by the velocity of the current, which must always be sufficient to sweep away the gases that would otherwise accumulate at the roof or the face of the headings and in the void places in the mines. All breakthroughs and crosscuts should be enlarged to the full area of the airways, and no obstruction should be permitted in these crosscuts. If practicable, the main airways should be widened so as to reduce the velocity of the air current passing through them to a normal velocity, say not to exceed 12 or 15 ft. per sec., except it may be for short distances in places where the airway cannot be enlarged.

Ques.—When coal is shot off the solid, how should the holes be drilled and what kind of powder should be used?

Ans.—When shooting coal off the solid, the holes should be drilled to such a depth and at such an angle that the line of least resistance will be less than the length of the hole. Also, the line of least resistance should be perpendicular to the hole, at its extreme depth. Again, the hole should frequently be slightly inclined upward or downward, according as the coal shoots harder at the top or the bottom of the seam. Where the coal is seamy or includes soft layers that are easily blown out in blasting, it is important that the hole should be inclined across such measures and the charge located in the harder layers of the seam. In no case should the charge be located too close to the roof or the floor of the seam. Only a normal charge of permissible powder should be used, which must not exceed 1½ lb.

Ques.—Where coal is undercut by machines, is it possible to have a windy or blownout shot? If so, what would be the cause?

Ans.—Windy or blownout shots more often result from insufficient mining or shearing of the coal. When undercutting by machine, it is possible that too much reliance is placed on the fact that the coal is well mined, and for this reason the danger of a blownout or a windy shot is practically eliminated. The miner is also tempted to put in a deeper hole and to locate the shot somewhat beyond the depth of the mining. A hole should never be drilled beyond the depth to which the coal is mined, so that the charge will not be located in the solid formation. When blasting coal mined by machine, it must be remembered that a less weight of powder is required to break down the coal, since the rupture is greatly assisted by gravity. The charge may also be located somewhat higher in the seam than would otherwise be done. If these precautions are not followed, a blownout or a windy shot may result even in machine mining. In such mining, the line of least resistance is measured by the distance between the hole and the mining, at their extreme depths. The weight of the charge must be proportioned to this distance, having due regard to the effect of gravity to break the coal.

Ques.—If two kinds of powder are used in the same hole, what is likely to be the result?

Ans.—The coarser powder will burn more slowly, and as a result a portion will be blown out of the hole while it is still burning, by reason of the quicker combustion and explosion of the finer-grained powder. The mixing of two grades of powder in the same hole is a dangerous practice and liable to produce a windy shot that will frequently result in a more or less local dust explosion, which may develop into a violent mine explosion under favorable conditions in the mine.

Ques.—When firing five shots in the face of a room, with one shot depending on another, what precautions should be taken to prevent a windy shot?

Ans.—The danger in this case is that one or more of the dependent shots may explode out of turn or before the explosion of the shot intended to relieve the one in question. In that event there is almost sure to result a blownout shot. Whenever two or more such shots are to be fired in a mine, each shot should be fired separately, in turn, in the order in which it was intended. In such case great care is needed to prevent the accidental explosion of succeeding shots. Fuse should not be used, and the squibs should not be inserted in any of the succeeding holes until they are reached in turn. The firing of two or more dependent shots in a working place is always attended with considerable risk to the miner or shotfirer, who must return through the smoke of the first shot in order to fire those remaining.

Ques.—How would you handle a failed shot to prevent an accident?

Ans.—It is never safe to attempt to pick out a shot that has failed to explode or has misfired. A great deal of care and judgment is required in handling such a shot. The safest plan is to drill another hole in a position to dislodge the missed shot. In doing this, however, the second hole should be drilled at a sufficient distance from the first to avoid the possibility of that charge being exploded by the drilling of the second hole. It will be well to observe extra precaution in this case to free the shot, by mining or shearing the coal in such a manner that a light charge only is required in the second hole. This is important, inasmuch as the first charge will probably be exploded when the second hole is fired. The two charges together would produce a heavy shot, similar in its effect to that of an overcharged hole. Also, special precaution should be taken to clean up the face before firing the second hole and to remove all accumulations of fine coal and dust that would be blown into the air by the force of the explosion of the two shots.

Coal and Coke News

Washington, D. C.

In filing a petition for the reopening of the Western rate case, the railroads operating west of Chicago have taken an expected step. It had been supposed that the action of the Interstate Commerce Commission in postponing the date when its order in the case would become effective to Dec. 31 meant that some new proceeding was probable, although there was no official announcement to that effect.

Now the case is sought to be reopened, and it remains to be seen what the Commission will say in reply to the roads. It is recalled that over a year ago the 5 per cent. case affecting the Eastern roads was thus reopened and, after rehearing, a new opinion granting some of the roads' demands was handed down.

In this case the argument for rehearing is supposed to be particularly strong, because of the fact that two forcible dissenting opinions were filed by members of the minority of the Commission.

Whatever is done will not affect the rates, including a large number of new coal rates, that were provided for in the original tariffs of the carriers, until at least the first of January next. That amount of delay in the final action is assured by the order of the Commission, already referred to wherein the effective date of the order in the case is put off to the end of the year. The new proceeding leaves the coal rates as they were before the petition was filed.

On the other hand, however, should the petition be granted and the case reopened, the time of the effective date of the order would probably be still further postponed, inasmuch as it would hardly be likely that the rehearing could be had and the present opinion be reviewed before the end of the year. In the event, moreover, that the Commission should hand down a new opinion, the coal interests could be but little more disadvantageously treated than they would be under the present opinion. As will be recalled, the present opinion holds that the advances in rates on bituminous coals except as to South Dakota points have been justified by the roads, the same being true of coke.

This means that, even if the Commission should reopen the case as suggested, and should further incline to greater concessions to the carriers, the only point at which coal interests could be injured would be in connection with the proposed South Dakota rates which might conceivably be upheld. Of course there would be the possibility that the coal interests might succeed in inducing the Commission, in case of such a reopening and revision, to disallow more of the increases in rates, but this does not now seem likely.

New Procedure in Exportation

From and after Jan. 1, 1916, a new procedure will be employed by the Treasury in connection with the exportation of merchandise. The new procedure will require as a prerequisite to the issuance of clearance papers a shipper's export declaration to be filled in by the shipper and filed with the Collector of Customs. The export declaration upon which will be stated the ordinary information regarding the nature, quantity, and value of the goods, the home of the shipper and the destination, etc., must be made under oath taken before a notary and will be retained at the Custom House as confidential. Where the shipper's export declaration has not been received clearance may be granted provided a bond of $500 is given by the master of the vessel to cause the filing of the declaration within 15 days after the date of clearance.

PENNSYLVANIA

Anthracite

Yatesville—The Lehigh Valley R.R. Co.'s mountain cut-off tracks were out of service on Sept. 28, due to a cave-in over the workings of the Pennsylvania Coal Co. The track and ground settled about 3 ft. for a distance of 60 ft. Track walkers discovered the settlement in time to flag all trains. A large force of men were set to work filling in the cavity with ashes and stone.

Hazleton—Properties sought in Butler Valley by the Lehigh Valley Coal Co. to be the outlet of the big 5-mi. drainage tunnel that will tap the water in the Hazleton Basin and do away with pumps have been obtained, and contractors bidding on the job have been notified that the work will be given out during October. It will take about two years to drive the tunnel.

Lansford—The present week has been a season of activity in the anthracite coal business, many of the mines in the upper Lehigh Valley having resumed full time with the coming of the change in the weather.

After having been imprisoned in the Foster Tunnel of the Lehigh Coal & Navigation Co. for six days nine miners were rescued practically unhurt. The men were entombed by a fall of rock and a rush of water following a blast. Two hundred men labored night and day in the rescue work. A cut was made through 300 ft. of solid rock and coal. After having been in the mine four days the men were given up for lost, as it was believed that the water must have reached them. On the sixth day the water was lowered sufficiently to allow one of the rescue corps to go into the opening on a raft. The men were found at the top of a chute. They had lived on the food which one of them had in his dinner pail, but this had all been consumed two days before they were rescued. After resting in the hospital for several days the men have practically recovered.

Scranton—Most of the mines in the anthracite region are now working on full time. All the collieries of the Delaware, Lackawanna & Western Co. are working full, and it is believed that full-time operations will continue for a considerable period. Orders have also been received to start full-time operations in all mines of the Scranton Coal Co., while similar instructions are being put into effect at the Delaware & Hudson mines.

Archbald—Four mine workers were badly burned in a powder explosion at the slope mine of the Archbald Coal Co. recently. These men were burned about the face and body when a spark from a mine lamp ignited a quantity of powder. One man was taken to the Mid Valley Hospital in a serious condition, while the others were removed to their homes.

Bituminous

Sample Run—The Clearfield Bituminous Coal Co., operating mines here, is making improvements. A new air shaft and fan system is being installed and the entire workings are being overhauled. The output of the company will be greatly increased as a result of the improvements.

Windber—Held prisoner for 15 hr. by a mining machine in the Gahagan mine, Thomas McCabe smoked and talked with his rescuers as they burned away the steel of the machine with an oxygen flame. McCabe was about to quit work when in some manner his leg was caught in the machine, and although the flesh was cut to the bone, he was securely held. In the hope of saving his leg, the coal company officials hurried to Johnstown for the necessary apparatus to cut away the steel, and skilled workmen finally released him. He was sent to the hospital, but physicians found that it was necessary to amputate the leg.

Connellsville—Scarcity of labor in the coke region is beginning to be felt by producers, but in the face of this condition some 300 ovens were recently added to the active list. The labor shortage is due to the fact that when the European war came on scores of coke workers were at their homes in Italy and Austria and have not returned. Production and shipment of coke continues at approximately 390,000 tons a week, with a material increase expected shortly.

Rillton—Mine safety car No. 6 of the Bureau of Mines will be at Rillton, Oct. 11, for the purpose of giving demonstrations in mine rescue and first-aid work. The car will remain here until Oct. 23, during which period lectures will be given relating to rescue work. On Oct. 25 the car will go to Jenner to remain until Nov. 20.

MARYLAND

Cumberland—The mines in this section are now working full time and some are employing more men. The Washington mine of the Potomac & George's Creek Coal Co. is increasing its force.

WEST VIRGINIA

Annabelle—A compressed air charging station for mining locomotives in the Annabelle mine was recently the scene of an accident which injured three men. This station evidently received too great a pressure of air, with the result that a blow-out occurred. The accident did not damage the mine beyond the immediate vicinity of the charging station, and the property damage will be small. The three workmen, however, comprising a locomotive crew, were all severely injured.

Charleston—Work will be resumed in full at the Briar Creek mines of the Olcott Coal Co. within a few days. It is believed that to fill the orders for coal that this firm has received it will be necessary to operate the mine six days per week. More than 1,500 men are employed by the Olcott company.

Shinnston—Indications point to an early development of a considerable area in the vicinity of Wyatt. It is believed that a railroad will come up Bingamon Creek within the next year or so. Most of the coal in that section has been sold for some time, and agents are now buying up the surface. The development of this territory will necessitate the construction of a railroad to the region.

TENNESSEE

Briceville—Mines in this section are beginning to work on longer time. The Cross Mountain mines are running 4 days a week and the Royal-Consolidated 4½ days. Heretofore they have been doing little better than two days a week. The miners in this section are looking for steady work to begin soon, and a party of 50 which went to Kentucky recently has returned.

KENTUCKY

Providence—The Providence Mining Co. has completed its new store and office building here and on Oct. 1 and 2 held a formal opening. This is a two-story vitrified-brick building, and with the other buildings occupied by the company gives it a solid block.

Louisa—Mines of the Eastern Kentucky Coal Co., at Torchlight, have shut down for an indefinite time. It is reported that the company will construct a firebrick plant to make use of the vein of fire clay which is known to exist on the property.

Logmont—The Crystal Coal Co., which has recently opened a new property, built new camps and added to its machinery equipment, is advertising for 100 loaders. The mine, located on the Stoney Fork Branch, 9 miles from Middlesboro, makes full time.

OHIO

Columbus—Preparations are being made by the officials of the Lorain Coal and Dock Co., to open another mine in the eastern Ohio district. The Lansing mine is now being put into shape for operation. This will make all four of its eastern Ohio mines in operation. They are the Lansing, Wheeling Creek, Crescent and Blaine. This company is now loading approximately 1,000 tons daily at the Logan County, W. Va., mine which is called Larado. It is expected to have the capacity increased to 2,000 tons daily by the first of the year. All of the present development is intended to be loaded over the one tipple, which is one of the largest in West Virginia.

Bellaire—It is stated that the Pittsburgh-Belmont Coal Co. will shortly put its No. 2 mine in operation. Repair men have been at work for some time and the mine is now ready for working. It has been idle for 18 months, but when running will give employment to several hundred men.

INDIANA

Clinton—The J. K. Dering mine No. 1 is on full schedule since receiving a contract to supply 1,000 tons of coal a day to the Grand Trunk R.R. The output of the mine is about 1,500 tons a day. It is electrified and employs about 250 men.

Bicknell—The first annual state-wide first-aid meet for miners will be held here Oct. 30 under the auspices of the local unions of U. M. W. of A., coal operators of Knox County, merchants of Bicknell, the Federal Bureau of Mines and the American Mine Safety Association. It will be the first annual meet held in Indiana. Prizes will be awarded for the various events. It is expected competition will be keen.

Vincennes—Efforts are being made to have the Vandalia R.R. Co. operate a miners' train from Bicknell to this city, making the trip out in the morning and returning in the evening in the interest of the miner's accommodation. If the train were to be provided to run to the American mine, the largest in the city, it is stated that 150 miners now living in Bicknell would make their homes here. The railroad company has offered to put the train in service on condition that the Vincennes merchants will guarantee $1,000 monthly in passenger fares.

ILLINOIS

Edwardsville—One of the cages in the No. 3 coal mine here fell down the shaft recently carrying a loaded coal car with it. The shaft was damaged and the hoisting apparatus was incapacitated. The 36 miners who were below had to climb up the airshaft. Nobody was hurt.

Hanna City—An explosion recently in the Empire Mine of the Logan City Coal Co. killed one man and fatally injured another while 75 miners were entombed two hours. The explosion occurred in gallery No. 6, 250 ft. below the surface and more than a mile from the mine opening. Escape to the shaft was cut off by a fall of slate and coal which filled the gallery. Fire broke out and it was an hour before the flames were extinguished. The imprisoned men were then located by tappings and rescued. The cause of the explosion has not been determined. The damage to the mine was several thousand dollars. State mine examiners are investigating.

Danville—The Interstate Commerce Commission was recently restrained from hearing further evidence in the discrimination and damage suits brought by coal companies against the railroads. The coal companies must now seek relief in cases of this nature in the state courts. This case is said to be the first of its kind that has come before the U. S. Court in this district and sets a precedent. The three judges hearing the case held that the Interstate Commerce Commission had no jurisdiction in the matter.

WYOMING

Kemmerer—Two miners in the employ of the Diamond Coal and Coke Co. recently entered mine No. 1 before the fire boss had given permission, thereby endangering their own lives and those of others. The men were arrested, arraigned before a justice of the peace, and after being found guilty, were fined $25 and costs.

FOREIGN NEWS

Cardiff, Wales—Two thousand miners in the Aberdare district and 400 at Dunvant recently went on strike, protesting against the employment of non-union men. They appointed grievance committees to confer with the colliery owners.

London, England—The Board of Trade is urging coal merchants to lay in as great a stock of coal as they are able to store before the advent of winter. This is done not only with the object of keeping the mines in full work, but also to reduce to a minimum the demands upon carting and transport facilities in general during the coming season. Householders are also urged to follow the example of the dealers where they have accommodations for storing coal, so that later on the available resources may be used to supply those who have no storage place at their disposal.

PERSONALS

James M. Page has resigned his position as superintendent of the Sunnyside Coal Mining Co.'s mines at Strong, Colo.

James J. Stickler has been appointed mine inspector in the 18th district of Pennsylvania, filling the vacancy caused by the death of John E. Curran.

Frank P. Cory, for the past few years superintendent for the Kennon Coal Co., of Flushing, Ohio, has been appointed deputy mine inspector for the 9th district.

W. L. Hughes, formerly connected with the Midland Coal Co. and at the head of the Hughes Coal Co. at Drakesboro, Ky., is now associated with the reorganized Lam Coal Co. at Bevier, Ky.

W. J. Wolfe, for the past several years superintendent of the Four States Coal Co.'s mine at Annabelle, W. Va., has resigned his position and will be succeeded by A. C. Beeson, from Pittsburgh, Penn.

George Watkins Evans, consulting mining engineer of Seattle, Wash., has returned from the Bering River coal field where he was in charge of subdividing it into units of from 320 to 2,560 acres for the United States Bureau of Mines.

F. B. Sutton, of Birmingham, Ala., engineer for the Bureau of Mines for the Southern District, has been spending some time at the Knoxville, Tenn., office. He recently addressed the meeting of the mine foremen of Tennessee held at Coal Creek.

John Harding, interested in the Connellsville coke industry for a number of years, has assumed the superintendency of the Garwood plant of the Aetna Coal and Coke Co., succeeding C. L. Patterson. Mr. Harding has lately been in business for himself.

P. J. Harrigan, of Martin's Ferry, Ohio, for some years superintendent of the Wheeling and Lake Erie Co., has tendered his resignation and accepted the position of general superintendent of the O'Gara mines in southern Illinois. His new position embraces about 15 mines in the southern part of the state.

George W. Gehres, general superintendent of the Martin, Bowood, and Republic mines of the Republican Iron & Steel Co., has resigned his position to take effect at once. He has been in the service of the company nearly two years. He will be succeeded by George W. Morse, superintendent at the Republic works.

Henry Wharton has resigned as secretary of the Westmoreland Coal Co., effective Oct. 1. At a recent meeting of the company the resignation was accepted and the board elected Herman Roll, secretary and Howard R Yearsley, assistant secretary. The company has also newly created the position of general sales agent and has appointed Carroll B. Nichols, former assistant secretary, to fill this office.

OBITUARY

William H. Hufstader, vice-president and general manager of the J. B. Jenkins Coal Co., of Buffalo, N. Y., died Oct. 4, at the age of 48. He had been ill for some time and was not expected to recover. He was formerly Buffalo sales agent of the Pittsburgh-Buffalo Co. and for a long time previous to that traveled for the Shawmut Coal & Coke Co. He was a man of excellent character and his loss will be severely felt. He leaves a wife and four children.

Charles Horning, Jr., for many years connected with the New York office of the Susquehanna Coal Co., died at his home, No. 2 Glenada Place, Brooklyn, Oct. 3, of a complication of diseases. He was born in New York City 51 years ago. Mr. Horning had been indentified with the coal business for more than 25 years first as a salesmen for W. M. Davidson & Co. Later he was associated with Percy Heilner & Son and then with Stickney, Conyngham & Co. When the Susquehanna Coal Co. succeeded the later company Mr. Horning remained with it becoming office manager some time later. He recently resigned his position and was to have become connected with Heilner & Son on Oct. 1. The deceased is survived by his widow and two daughters.

INDUSTRIAL NEWS

Brownsville, Penn.—A barge being towed by the steamer "Volcano" of the Diamond Coal & Coke Co. was recently caught in the swift current of the river and swept against the wall of lock No. 5, resulting in the loss of 7,000 bu. of coal.

Welch, W. Va.—Col. William Leckie has recently taken over 2,400 acres of coal land on Piney Creek, in Raleigh County, which was formerly owned by the McCreary interests. As soon as the railroad is extended up Piney Creek Colonel Leckie will develop this land.

Charleston, W. Va.—The Central-Fairmount Coal Co. has closed a yearly contract with a railroad company for the latter's entire requirements of coal, and is installing new equipment and hiring additional miners so as to increase the output of its local mines about one-third.

Moundsville, W. Va.—Men are now at work cleaning up the Fort Pitt mine across the river from Moundsville. The mine will be in shape for resumption in the near future. It is stated that this mine is to be sold at public auction shortly and will be put in operation immediately afterward.

Huntington, W. Va.—The past month's coal record on the Chesapeake & Ohio R.R. was higher than all previous records, by somewhat over 17,000 tons. During August, which was until September the banner month in the road's history, 2,423,120 tons were handled; while in September 2,440,955 tons were hauled.

Stockton, Penn.—The Lehigh Valley Coal Co. has started preparations for extensive stripping operations. As preliminary to the real work of taking out coal contractors are removing several hundred thousand tons of culm which has accumulated for years, the ground having been used as a dump for colliery refuse.

Harrisburg, Penn.—Estimates furnished on Sept. 30, to the Pennsylvania R.R., show a total of 1,370,000 tons of coal stored in the vicinity of Harrisburg. Of this amount 620,000 tons of anthracite coal is piled up at McClellan, bituminous being stored as follows: Lucknow, 250,000 tons; Enola, 250,000; Rutherford, 250,000 tons.

Boston, Mass.—Progress is being made on the new rehandling plant of the Darrow-Mann Co. at Mystic Wharf, Boston. A 600-ft. pier where the largest steamers can discharge is one of the features and there is ample yardage for forwarding shipments for delivery inland. Developments with regard to this plant are being followed with much interest by all the trade.

Trotter, Penn.—Suit was filed on Sept. 28 by Luke Gillen against the H. C. Frick Coke Co., for $10,000 for personal injuries received from a fall of coal at the Trotter mine May 29, 1913. The statement of claim filed alleges that the plaintiff sustained a fractured collar bone, broken ribs and injuries about the head, arms and legs. Gillen was a track repairman inside the mines.

Hickman, Ky.—In view of probable controversy and another appeal to the Interstate Commerce Commission the Nashville, Chattanooga & St. Louis R.R. has split the difference in the increase in rates on coal it is authorized by the commission to charge. Instead of making the rate $1.50 as the commission provided, the railroad is increasing the former price of $1.20 to $1.35.

Wilkes-Barre, Penn.—Judge H. M. Edwards recently handed down an opinion in the coal royalty case of the heirs of George M. Hull of Blakely against the Delaware & Hudson Coal Co. The decision is in favor of the plaintiffs. More than 6,000 typewritten pages of testimony were read and reread by the Court, the opinion covers 100 pages and the request for findings and answers covers 175 pages.

Toledo, Ohio—A job of salvaging which will go on record as the first feat of its kind ever attempted in Toledo harbor, will be attempted here by Harry Baker, of Detroit, a diver and wrecker, who will try to raise the steamer "Genoa" without removing its cargo of 1,200 tons of coal, and float it into dock. Baker has undertaken to cofferdam the vessel, pump the water from it and float it without lightering the cargo.

Philadelphia, Penn.—It has been estimated that the anthracite shipments for the month of September are at least 500,000 tons below the production of 1914, which was 6,296,192 tons. This past month, along with June, July and August were so short of tonnage that it is believed when the figures for September are officially announced it will show that the nine months of the year are 2,500,000 tons short of the similar period of 1914.

Salt Lake City, Utah—While the details of the purchase of the properties at the American Fuel Co. by the Utah Fuel Co. have not been worked out, it is stated that the deal has been made. The price paid for the property is said to be between $1,250,000 and $1,500,000. It is stated that everything is ready for the final transfer as soon as inventories are made. It is believed, however, that the Utah Fuel Co. will not take charge of the property before Nov. 1.

Pittsburgh, Penn.—Residents of Valley Camp, a village on the Allegheny River near here, are in fear that the town will be engulfed in the abandoned workings of a coal mine over which the houses are built. Cracks recently appeared in several streets, and porches began to settle into holes which suddenly yawned as the supports in the old entries and rooms gave way. Water and gas pipes were broken, and houses were damaged by falling plaster. All the affected streets have been closed by the authorities.

Louisville, Ky.—The bondholders of the Continental Coal Corporation have agreed in requisite numbers to the plan of reducing interest on an issue of bonds totaling $1,900,000 for a two-year period ending July 1, 1917. For two years, under a trust agreement arranged in connection with the Louisville Trust Co., these bonds will pay 3 instead of 6 per cent. Consent of 80 per cent. of the bondholders was obtained. The corporation's mines are located in Bell and Harlan counties, and more than $600,000 of the bonds are owned in Louisville.

Buffalo, N. Y.—The new box-car unloader built at the Lehigh Valley lake shipping docks at the Tifft Farm is completed and has been given a trial. After some minor adjustments the apparatus will be used regularly in loading lake vessels. The car is not elevated, but is tilted up at an angle of 32°, first at one end and then the other, using a device for assisting the coal to run out of the doors to an apron, where it is taken up by pan conveyors and discharged into the vessel's hold without material breakage. It is claimed that 1,000 tons an hour can be transferred by the unloader, which is an entirely new invention, calculated to handle box cars without taking up either so much time or ground as the present wooden trestle. It was built by the McMyler Interstate Co., of Ohio.

New Orleans, La.—Coal concerns operating in this territory were the heaviest sufferers from the storm of Sept. 29 and 30. There are 22 known dead in New Orleans; 250 dead in the parishes surrounding the city, and the damage done to property can only be estimated in the millions. The work of rehabilation is being pushed rapidly, and business has been put back to practically a normal basis. The greatest loss of the storm probably will be sustained by the Monongahela Coal & Coke Co., which lost a power boat, tugs and 246 barges loaded with coal. Captain J. S. Menges, manager of the floating stock of the Monongahela company, and three in his crew were drowned. Work of raising the coal from the bottom of the Mississippi is being pushed rapidly. Suction dredgers have been ordered from various headquarters of the company. The W. G. Coyle Coal Co. lost two pump boats and four barges. The Crescent City Coal Co. lost two tugs and four barges loaded with coal. The Alabama & New Orleans Transportation Co.'s lighter No. 3 was beached 80 miles below the city, but all efforts are being made to float her. A tug boat and barge, property of the Bisso Towboat Co., sank at the head of General Taylor St. The barge was loaded with coal. The West Kentucky Coal Co. lost 70 loaded, and two empty coal barges and four pump boats. The reserve fleet maintained by the company was completely wiped out, not a barge or pump boat being saved. The fleet at the coal loading station fared a little better; one angle boat, two loaded, and 23 empty barges being kept afloat. A total of 36,000 tons of coal was contained in the 70 loaded barges which went to the bottom, but it will be possible to salvage a certain proportion of this by dredging, since the barges sank at their moorings.

Notary Public.
(My commission expires March 30, 1917.)

Coal Trade Reviews

General Review

Colder weather releases more anthracite orders. Strong constructive features in the bituminous market. Export trade dominated by vessel situation. Large movement from Upper Lake ports. Middle Western trade satisfactory.

Anthracite—An encouraging and satisfactory briskness characterizes the hard coal market. The tonnage movement is still substantially less than normal, but with anything like average weather conditions an active business is assured for the next half-year. Coal is moving out freely from the retailers' yard, and more orders to the wholesalers are being released, some even being of an urgent character. An encouraging feature of the situation is the firm position dealers are now taking as regards credit, all orders not on a strictly cash basis being generally declined. Colder weather toward the Northwest has started coal moving to interior points from the upper Lake ports making more storage room available, and releasing further shipments from this end.

Bituminous—Prices are steady, the market well maintained, and there is a well defined feeling that next month will find the situation much stronger. The market has shown a persistent improvement over the past several weeks, and along conservative lines. Strong constructive features have developed in the shape of the restricted car and labor supply and the expanding export trade, with the result that dealers are openly optimistic and some even enthusiastic regarding the outlook. Scarcely any free coal is noted in any direction, and some manufacturers are even taking tonnages exceeding their contract agreements. So far there has been no particularly significant price change with the possible exception of general hardening all along the line and particularly as regards the better qualities.

Exports—Our foreign trade is now completely dominated by the vessel situation. The steadily increasing demand for grain vessels, noted over the past several weeks, has resulted in freights being whirled up to absolutely prohibitive levels, except in the case of most urgent demand. The export movement has contracted in direct proportion to the increase in freight rates. The September dumpings over the Hampton Roads piers show a sharp decline over the previous month, while the weekly movement out of Baltimore now occasionally gets down to about one-fourth the maximum. The situation is even reflected in the coastwise freights which are stiffer and slightly higher.

Lake Trade—The usual between-season contradictions prevail in the Ohio trade. It is generally agreed that the market is some stronger in any event, though it is noted that the consumers in certain localities are still confident of being able to obtain all the coal they require at any time and are showing no interest. The car shortage is now definitely at hand and shippers are refusing to consider orders in which any special equipment is specified. The recent cold snap in the Northwest brought with it a flood of urgent orders indicating that retailers' stocks are light, but there is still little storage space available, and receipts continue small for the time being.

Middle West—Sporadic low temperatures have created some activity in retail distribution which has been supplemented by some heavy buying as a result of the advance in the freight rates, effective the first of the current month. The market is not notably active, but the technical position is strong. Prices are generally on a substantially higher level than a year ago, and operators in some districts are already sold up ahead on certain grades. Accumulations of the steam sizes are noted as a result of the increased production of the domestic grades, but there is no attempt being made to force the market. Working schedules in the mining regions are much improved.

A Year Ago—Anthracite collieries continue on a full time basis, but the demand has slowed up temporarily. Considerable bituminous coal available and current business generally discouraging. Large preponderance of finer sizes still demoralizing the interior market. England increases her export shipments.

BUSINESS OPINIONS

Iron Age—September made an astonishing record for steel and pig iron output, and the pace is even faster in the first week of October. The present month, in view of the custom at all plants to strain for records in October, now promises the passing of the 3,000,000-ton mark in both pig iron and steel ingots. Pig iron production in September was 2,852,561 tons, or 95,085 tons a day, well beyond the daily rate of 92,369 tons in February, 1913, the previous record month. The 268 furnaces in blast Oct. 1—a gain of 19 in the month—had a daily capacity of 97,535 tons, and as a few furnaces have blown in in the past week, pig iron production is now at the rate of about 36,000,000 tons a year. It was 33,500,000 tons a year as September opened.

American Wool and Cotton Reporter—The wool market is recovering from the slight easing off which it recently underwent. It is steadier than it was for the previous week. The consensus of opinion is that prices will remain at least steady and a good number feel that advances will be made. A quantity of wools at cheap prices have sold, including medium grades.

Boston News Bureau—It seems idle to talk pessimistically when every fundamental factor in this country seems favorable for the time being. General trade, outside of war orders, has apparently called the turn for the better. Railroad earnings are beginning to show a marked improvement. The strength in raw products is based purely on demand and supply. But the great advance in prices of some raw products has served to conserve sentiment. Cotton mills are not purchasing the quantity of cotton they usually do at this season of the year because of the sharp advance in the price. We are in the midst of a wild speculation in the so-called war stocks. This strength, however, has a basis and that is their earning power. Perhaps the most pleasing feature in the market situation is the increasing strength in the railroad securities.

Bradstreet—Trade reports, good last week, are even better this week. There is more snap to trading, uncertainty about the future has well-nigh given place to certainty, interest in the European war is simmering down to a discussion of what it will produce in the way of orders for the United States, the Anglo-French loan to be floated here favorably affects credit-making factors, money is abundant at low rates, some branches of the finished steel industry are in a sold-up condition, railway buying is in evidence, reports of car shortages in the Middle West are noteworthy, labor is becoming scarcer, lower temperatures have quickened distribution of seasonable goods, and payrolls continue to expand. Incidentally, flour millers at the Northwest are sold ahead, some munitions plants are working three shifts in 24 hr., machine-tool shops are taxed to make deliveries, and in some centers these interests are bidding against makers of munitions for needful labor.

Dun—Success of the foreign loan negotiations foreshadows a further extension of American enterprise and emphasizes the position occupied by this country in the field of international finance. With constructive factors multiplying, prospects steadily brighten, and actual gains in business are now more in keeping with the growth of optimistic sentiment. Almost without exception, reports from the leading centers tell of accumulating evidence of progress and only in isolated cases, such as in the lumber trade, is depression still manifest.

Marshall Field & Co.—The current week shows a more active wholesale distribution of dry goods. There has been a larger attendance of buyers in the market. Collections are fair. The advancing market on raw cotton has resulted in material advances in prices on cotton yarns and in many lines of cotton goods. The conservative manner in which retail merchants have been buying during the last few months and their light commitments for fall delivery have created a shortage in many lines of merchandise, which always means advancing prices as well as uncertain deliveries.

ATLANTIC SEABOARD

BOSTON

Hampton Roads market continues steady. Georges Creek and Pennsylvania grades practically unchanged. Water freights slightly firmer and anthracite situation is improved.

Bituminous—The market for Pocahontas and New River continues steady and prices f.o.b. Hampton Roads are reasonably well maintained. While there are no pronounced developments for October coal there is now a well-defined feeling that by November the situation on the Southern coals will be much stronger. Much of this is based on the good outlook for export trade, but the prospect rests somewhat on a possible curtailment in car supply and also on a shortage of labor. One of the interesting bits of news from the mining regions concerns the scarcity of skilled help as engineers, machinists, and others. They are so much in demand at munition plants that tempting inducements have been made and in many cases accepted.

Water freights are a little firmer; 70c. was paid this week on a barge from Hampton Roads to Providence, which is 5c. up from previous charters; 80c. is a quotable rate from the same ports to Boston. The owners of the schooner "Mary W. Bowen," about 3,500 tons capacity, long a familiar vessel in the coastwise coal trade, are negotiating to sell her to freight lumber from Canada to France, a further illustration of the passing of the schooner collier.

The Georges Creek shippers are handling a normal output with ample coal for spot requirements. There is no apparent shortening up, but the off-shore demand is counted upon to absorb a large tonnage during November.

There are no special developments in the Pennsylvania grades. The quality coals show some signs of hardening prices, but there is no price movement that is at all general.

Anthracite—The retailers are now amply supplied with business and the wholesale market is looking up considerably. Orders have been coming in very steadily the past week and the dealers are beginning to press for shipments. Broken coal is quite short at the loading piers and there is an increasing shortage of the steam sizes.

Bituminous quotations, f.o.b. loading ports at points designated, are about as follows per long ton:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields	$2.15@2.65	$2.45@2.95	....	$0.90@1.40
Cambrias and Somersets	2.40@2.90	2.70@3.20	....	1.15@1.65
Georges Creek	2.92@3.02	3.22@3.32	$2.85@2.95	1.67@1.77

Pocahontas and New River prices, on cars Boston, are $3.55@3.73, Providence, $3.50@3.68, and f.o.b. loading port at Hampton Roads, $2.80@2.85.

NEW YORK

Anthracite market shows improvement. Buying active and prices for individual coals much stiffer. Bituminous demand increases. Better prices asked and outlook bright.

Anthracite—The first week in October has brought about much improvement in the anthracite market. Weather conditions have been favorable for coal consumption and coal is beginning to move. Wholesale buying is more active than last week and quotations are closer to the full companies' circular for the individual product.

Demand along the line shows greater improvement than at Tidewater. The betterment is more noticeable among the independent coals than elsewhere. Occasionally odds and ends have been let go at less than August prices, but most of the coal is bringing at least full August circular and some better.

Nut coal is the longest of the prepared sizes. In the steam sizes buckwheat is becoming scarcer; the better grades are commanding the full circular, while the cheaper coals are being taken up quickly.

Current quotations, gross tons, f.o.b. New York, tidewater, follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$5.20@5.30	5.35	$5.25@5.35
Stove	5.30	5.20@5.30	5.35	5.25@5.35
Chestnut	5.55	5.30@5.55	5.60	5.40@5.60

Bituminous—The bituminous situation at tidewater shows much improvement and demand and prices are much stronger. Dealers appear to be enthusiastic over the outlook and predict still better business within the next week or ten days. Some are of the opinion that the long looked for rush is very near.

The demand from manufacturers all over the East is increasing and many are now taking more coal than their contracts call for. At Tidewater there is no large quantity of free coals and what can be spared is easily placed. All surplus coals are being held firmly and in urgent cases very good prices are being received. The harbor is fairly well cleared up of demurrage coal.

Labor is scarcer and this is becoming serious problem in some cases. Car supply on two of the largest roads was good the first three days of the week and bad the last three.

Exporters report good demand. One large exporter predicts shipments of 1,500,000 tons a month shortly. It is also reported that a contract has been closed for sending 6,000 tons of gas coal to Italy. Bunkering business continues active.

Quotations f.o.b. New York tidewater per gross ton follow:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85

PHILADELPHIA

Anthracite broken and stove in demand. Nut and pea better, but egg is off. Steam sizes active. Price cutting in retail trade grows. Bituminous continues to improve. Exports quiet, with vessels scarce.

Anthracite—Prosperity in a mild form prevails in the local market. All shippers are reporting greatly improved conditions. However, while there is some briskness due to the return of normal weather conditions, the tonnage is still behind what was expected. But with anything like favorable weather conditions there should be six straight months of good business from now on.

Dealers' teams are now seen in greater numbers on the streets than for a long time. All retailers report moving considerable coal and in fact seem to be busier than the shipper, but there is no doubt that dealers will begin to order in greater volume now. Shippers report collections better, which is very encouraging as it indicates that the retailer is doing more of a cash business. Retailers are now insistent on cash payments and are declining all other business.

While the railroads are not advertising the fact to the public, the car shortage "bug-bear" is looming up at no distant date.

Broken coal continues in active demand, more especially by the manufacturers. Egg coal has fallen off to some extent and the price has weakened. One conservative old concern with a very high-grade coal surprised a few selected buyers by offering this size at $3.65 at the mines. Stove is still strong, both in demand and price. Chestnut, while still far from normal, has shown a slow but steady improvement. Pea is undeniably firmer, but it is known that several individuals have offered to contract until Jan. 1, at $2 and no tax; this is in the face of considerable talk of a general advance of 25c. per ton on Nov. 1. Retailers will not like to see such a price effective as it will enable the price cutters to continue harassing their higher-priced competitors and spoil the effect of the advertising of the dealers who always maintain prices.

As noted last week, the steam sizes have assumed some briskness, which has continued and seems likely to for some time, as more people see the wisdom of stocking up against emergencies.

Circular prices, f.o.b. mines, per gross ton, to which the Pennsylvania State tax of 2½% per ton must be added, are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.25	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—The market is growing better all the time and all seem to be most optimistic as to the future. There has been no rush, the improvement having come gradually until most of the operators are now quite busy. Many companies are reporting car shortage in spite of the fact that many railroad officials claim they are meeting the demand and expect to continue doing so. The operators resent this attitude, especially since they are compelled at a time like this to shut down occasionally because of a lack of cars. The export business still remains somewhat quiet, but even at that a fair tonnage is going forward. This trade continues to be handicapped by a lack of vessels and the storms of the past week have prevented so many ships from making port that some concerns with considerable coal at tide, are worrying about car-demurrage bills.

There seems to have been a general though slight increase in prices and a good average per gross ton at the mines is:

Georges Creek Big Vein..	$1.70@1.80	Fairmont gas, ¾........	$1.25@1.35
South Fork Miller Vein..	1.55@1.65	Fairmont gas, mine-run..	1.10@1.20

Somerset (ordinary).....	1.10@1.20	Fairmont lump, ordinary.	1.00@1.10
West Va. Freeport.......	.95@1.05	Fairmont mine-run......	.90@ .95
		Fairmont slack..........	.65@ 75

BALTIMORE

Big orders for foreign coal are piling up, but the movement is still restricted by lack of bottoms. Bituminous market gradually stiffens. Anthracite at retail now on the maximum winter basis.

While a total of more than 200,000 tons was exported from Baltimore during the month of September, the latter half of the period saw a big drop. Only 20,287 tons moved the last week in September. Three to four times that amount was shipped in some of the weeks of July and August. The delays are due to the fact that vessel bottoms are scarce. Several vessels under time coal charters are expected the coming week, however, and the export movement should improve again.

With business steadily improving the anthracite dealers here have settled down for a brisk fall and early winter period. On Oct. 1 the highest winter schedule to the retail trade, which provides an extra 25c. charge for hauling in heavy weather, went into effect. This schedule is as follows: Hard—No. 1, $7.35; No. 2, $7.60; No. 3, $7.85; No. 4 (nut), $8.10; pea, $5.85; buckwheat, $4.50. Sunbury—No. 2, $7.85; No. 3, $8.10; No. 4, $8.35. Lykens Valley—No. 2, $8.60; No. 3, $8.85; No. 4, $8.85. To this a charge of 25c. a ton is added when delivery is by bags or baskets.

The bituminous market is gradually stiffening. Car shortage was again a very apparent factor. Prices were firm at the following figures:

	Mines	Balt.*	Fairmont	Mines	Balt.*
Geo. Crk. Big Vein	$1.75	$2.93	Ordinary mine run	$0.85	$2.28
Geo. Crk. Tyson...	1.40	2.58	Ordinary ¾........	1.00	2.43

Freeport.........	.85	2.03@2.08			
Miller Vein.......	1.10	2.28@2.33			

*F.o.b., outside Capes.

HAMPTON ROADS

Dumpings for week not so heavy as anticipated. Shipments from Hampton Roads during month of September amounted to 1,408,194 tons.

The coal dumpings over the Tidewater piers at Hampton Roads have not been as much as anticipated. There has been a falling off somewhat in the export movement with coastwise about normal. There has been a fair number of bunker steamers calling here and also a quantity of bunkers supplied to the Atlantic Fleet in Hampton Roads. Of the coal exported the largest quantity has gone to Italian ports, viz.—Spezia, Leghorn, Genoa, Torre Annuziata, Catania and Naples. The largest single shipment was loaded into the collier "Ulysses" for Cristobal and amounted to 12,010 tons of cargo and about 1,000 tons of bunkers.

The quantity of coal in cars on the railroad yards while not extra heavy is at the same time in excess of the normal with demand light. Circular prices are still being quoted on all grades but it is believed that some of the suppliers are shading these prices somewhat in order to dispose of coal on which there is a prospect of demurrage.

During the month of September there was shipped from the three ports on Hampton Roads 1,408,194 tons of coal of which the Norfolk & Western dumped 722,670 tons, the Virginian Ry. 311,674 and the Chesapeake & Ohio Ry. 373,850 tons. Although the Norfolk & Western dumped more coal than the other two roads combined, at the same time they have fallen behind their August dumpings. The Chesapeake & Ohio Ry. is also considerably behind their August figures while the Virginian Ry. has shown some advance over their last month's dumpings.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

	Week Ending				
Railroad	Sept. 4	Sept. 11	Sept. 18	Sept. 27	Oct. 2
Norfolk & Western....	232,394	156,459	182,047	163,400	131,055

OCEAN FREIGHTS

The freight market on grain is simply "boiling," and $15.60 per ton is now bid on grain to the West Coast of Italy. With this very active demand for grain it is materially difficult to interest owners in coals, and we cannot quote freight rates to the Mediterranean or even to the Plate with any degree of certainty. We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana..............	$2 50@2 75	Bermuda.............	**$3.00**
Cardenas or Sagua.....	2.75@3.00	Vera Cruz............	5.00@ 5.50
Cienfuegos...........	3.00@3 50	Tampico.............	5.00@ 5.50
Port au Spain, Trinidad.	3.75@4.00	Rio..................	8.64@ 9.12
St. Lucia............	3.50@3.75	Santos	8.64@ 9.12
St. Thomas...........	3 25@3.50	Montevideo...........	8.40@ 9.60
Barbados.............	3.75@4.00	Buenos Aires or La Plata	8.64@ 9.60
Kingston.............	2 75@3.25	Rosario..............	8.88@ 9.84
Curacao..............	3.25	West Coast of Italy....	10.80@13.20
Santiago.............	3 00@3.25	Barcelona............	10.56@11.52
Guantanamo..........	3 00@3 25	Valparaiso or Callac....	7.50
Demerara............	5.50@6.00	Marseilles...........	10.80@12.00

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Spot prices firm; contract coal easy. Operators at 60 to 70%, with more car shortages reported. Demand from steel industry heavy.

The market for spot shipment continues firm, but contract prices are not correspondingly strong; that is, mine-run is stronger at $1.05 for prompt than it is at $1.15 on contract to Apr. 1. The market is preparing for the decreased absorption that regularly occurs with the termination of Lake shipments, even though the decrease this time will be less than usual as Lake shipments are unseasonably light. Mine operations are at between 60 and 70%, taking the district as a whole.

Car shortages are being reported still more frequently and a decided scarcity is one of the possibilities of the next six weeks, as final shipments for Upper Lake ports are being made.

The steel industry continues to absorb its maximum of coal, but does not seem to be stocking up to any extent. Railroad demand is improved, with some stocking. Demand from retailers is below normal for the season, the weather being abnormally warm.

We quote free coal: Slack, 50@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1.05; ¾-in., $1.15; 1¼-in., $1.25; contract to Apr. 1: mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

BUFFALO

Bituminous strong. Cars growing scarce. Local demand better than further east. Anthracite beginning to move.

Bituminous—The market is strong, not only from a heavy demand, but from the growing scarcity of cars also; if this latter trouble grows much worse there will be a decided advance in price before long. There is no dependence to be placed on flat-bottomed cars now, some shippers refusing to take orders for them. The chief difficulty is soon to be in the lack of motive power and it now looks as if the late fall would see one of the most severe car shortages on record.

Reports from the Pittsburgh region are to the effect that the Pennsylvania R.R. is furnishing not more than 75% of the coal cars asked for in many instances, and the difficulty is just begun. The bituminous shippers from that district are not hesitating to refuse orders if there is any doubt about acceptance and prompt pay and the rule is to pay no attention to orders for flat-bottomed cars.

Quotations on best grades, f.o.b. Buffalo, are:

	Pittsburgh	Allegheny Valley	Penn. Smokeless
Lump	$2.65	$2.45	$2.55
Three-quarter	2.50	2.25	....
Mine-run	2.40	2.15	2.30
Slack	2.05	2.00	2.30

Quotations and freight rates to points east of Rochester, N. Y., and Kingston, Ont., are per long ton and balance of this territory is on the short-ton basis.

Anthracite—The fall trade is setting in slowly. There have been quite a good many orders for delivery early in October, as that would not oblige payment to be made till November. Otherwise the improvement is not marked. Some increase in the rail movement is also reported and the shipments from the upper Lake docks are showing something of a fall-trade proportion, so that the Lake shipments can be kept up and possibly added to before long. The local anthracite trade is about as quiet as ever.

Shipments by Lake for the week were 98,650 tons, for September, 411,750 tons and for the season, 2,791,075 tons, as against 428,436 tons for September last season and 3,156,781 tons for the season to date last year.

Prices on anthracite per long ton, f.o.b. Buffalo, are: $5.60 for grate, $5.85 for egg and stove, $6.10 for chestnut and $4.30 for pea, to which 25c. per ton is added for delivery on board vessel. This price includes the Pennsylvania state tax.

COLUMBUS

The steam business shows increased strength. Considerable domestic buying and the tone of the market generally satisfactory. Price list is well maintained.

Increased demand for steam grades is the leading feature of the coal trade. This is noticeable in every direction and is due primarily to the activity shown in manufacturing circles. Munitions factories are springing up on all sides and the iron and steel industry is also booming. The tone of the market remains good and future prospects are growing brighter.

Considerable Lake tonnage is reported and vessels are busy moving coal from Ohio Lake ports to the Northwest. The congestion on the docks of the Upper Lake ports is relieved because of a better interior movement. The Toledo docks of the Hocking Valley loaded 88,000 tons during the week ending Oct. 1. A large percentage of this coal came from West Virginia, however. Shippers will be busy up to the close of navigation.

One of the worst features at this time is the appearance of a car shortage. On the Chesapeake and Ohio the shortage has been very marked. The Hocking Valley is making an effort to keep all of the coal cars possible on their lines. Shippers anticipate a rather severe car shortage during the winter.

Prices in Ohio fields, f.o.b. mines, are as follows, per short ton:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.50	$1.60		
Inch and a quarter	1.40	1.45	$1.30	$1.30
Three-quarter inch	1.25	1.35		1.25
Nut	1.15	1.25		1.15
Mine-run	1.05	1.10	1.00	1.05
Nut, pea and slack	.60	.65	.50	.55
Coarse slack	.50	.55	.40	45

Mines have been working at about the following percentages of full capacity:

District	Week Ended Sept. 11	Sept. 18	Sept. 25	Oct. 2	District	Week Ended Sept 11	Sept. 18	Sept. 25	Oct. 2
Hocking	40	45	50	50	Cambridge	44	45	45	45
Jackson	25	25	25	25	Massillon	40	45	45	45
Pomeroy	50	60	75	80	Eastern O.	60	70	75	80
Crooksville	35	40	40	40					
					Average	42	47	50	52

CLEVELAND

Prices are again higher. The supply is small. Demand for domestic coal causes an advance in prices. Short car supply restricting shipments.

There is a generally improved market with an upward tendency that is quite marked. The demand for domestic fuel is not as large as in former years, natural gas supplanting coal in many homes, but the trade is buying more freely and the car supply is proving a factor in getting deliveries.

Only 270 cars of new coal arrived over last Sunday. This is smaller number than usual and very much less than was customary at this time of the year four or five years ago. Fine coal is advancing, due largely to the lack of three-quarter orders, the Lake trade being only fair, though better than it has been.

The Lake trade is easily summed up in the report of The Tomilson Co., vessel managers and agents, of Duluth, which states that hard-coal receipts at Duluth-Superior to Oct. 1, 1915, totalled 1,129,220 tons, as compared with 1,070,800 to Oct. 1, 1914; bituminous receipts totalled 4,750,145 tons to Oct. 1 last, as compared with 6,309,300 tons to Oct. 1, 1914.

Jobbers are being quoted at the following prices, f.o.b. Cleveland per short ton:

	Pocahontas	Youghiogheny	Fairmont	Bergholz	Ohio No. 8
Lump	$3.70				
Lump, 6-in.				$2.30	
Lump, 1¼-in.		$2.40		2.10	$2.15
Lump, ¾-in.		2.30	$2.05	2.00	1.95
Egg	3.70				
Egg, 6-in				1.90	
Mine run	2.80	2.15	1.95	1.85@1.90	1.85
Slack		1.75@1.80	1.85	1.65	1.85

DETROIT

Buying of steam coal well sustained. Colder weather revives interest in domestic sizes. Anthracite business confined chiefly to retailers. Lake trade continues light.

Bituminous—Steam coal users are buying with sufficient regularity to make a gratifying volume of business for local shippers. Prices are steady and the quantity of consignment coal pressed on the market is not troublesome. With the lower temperature now prevailing domestic coal is coming in for more interest and inquiries are more frequent. However, still more frigid weather will be necessary before the business is really active.

Anthracite—High temperatures, through most of September restricted the retail business in anthracite but a more active demand is now apparent.

Lake Trade—The heavy demand for vessels to move grain has brought a rate of 6c. a bushel. Ship-owners, in the effort to take full advantage of these profitable rates are avoiding the delays attendant in moving coal by sending their vessels on the upbound trips without cargo. Some of the freighters carrying ore on contracts are handling coal but the movement is lighter than usual at this season

TOLEDO

Lake trade quiet. Car shortage still expected.

The domestic trade is fairly strong, due partially to the cold weather of the past couple of weeks. Steam coal also continues to show more strength. Lake shipments are still light. Considerable less coal has moved from Sandusky docks of the Pennsylvania Co., this summer, contrary to expectations of a better business. The ore shipments on the other hand have been very strong; more than 85,000 tons were received at this port in six days, an unusual movement. Freight rates are increasing. Some of the boats will lay up after Nov. 4, the date when the LaFollette seamen's bill goes into effect.

CINCINNATI

Improvement in sentiment is evident, although business remains relatively slow. Demand is much below normal in all lines.

Increasing inquiries are noted, mostly from the retail trade, steam consumers still showing general indifference as to their fuel requirements. Both retailers and consumers are apparently confident of their ability to get all the coal they want. This feeling is undoubtedly responsible for the prevailing lethargy in the trade, coupled with the fact that barring a few chilly days the weather remains pleasant. Production of coal is also at a high rate and this has been largely responsible for the competitive conditions which have hurt business of late. The opinion is generally that the market requires some sustained cold weather and this can hardly be looked for early in October. It is felt that this is bound to come, however, and the trade therefore feels that the worst is over, and that good business is ahead.

LOUISVILLE

Between seasons condition prevails. Market less active at the moment but outlook is still encouraging.

There has hardly been enough cool weather to relieve the stocked-up condition of the retailers and they are not in the market at this time, while the accumulation of the steam sizes is worse than before; a considerable amount of this latter is on demurrage. Operations at the Kentucky mines are on about the same basis as a week ago, western Kentucky mines not being as active as those in the eastern field. Car-shortage troubles are not as keenly felt just now, however, but this is only on account of a slackening in the demand. Prices are only fairly well maintained on the following basis for the best grades, per long ton, f.o.b. mines: Block, $1.75 to $1.85, with the especially fancy grades going higher; 2x4-in. round, $1.40 to $1.45; nut and slack, from 50 to 60c., for the best grades, and screenings are in very poor demand.

COKE

CONNELLSVILLE

Furnace coke contracts for 1916 at $2.25 and $2.35. Negotiations continue on sliding scale contracts. Spot coke firmer. Production and shipments not materially changed.

Very few furnace-coke contracts have been closed on a sliding scale basis, but in line with the suggestion in last report there has been some business done at flat prices. One contract involves 15,000 tons a month over the first-half at $2.25 and another 15,000 tons a month over the year at $2.25 if one brand is selected and $2.35 if another is chosen. As a rule the operators quote $2.35 to $2.50 for first half, but would take a shade less over the year.

Sliding scale contracts under negotiation are usually on such a basis that with the coke to advance 20% as much as pig iron they would yield $2.15 for the coke when basic pig is at its present level, $15, valley. It is expected that many contracts will be closed within the next fortnight as buyers and sellers are now fairly close together, and enough business has already been put through to show approximately where the market stands.

Furnace-coke for prompt shipment has stiffened at least 10c. in the week. Foundry coke is firm for both prompt and contract. We quote: Furnace coke, spot, $1.75@1.80; fourth quarter, $2; first half, $2.35@2.50; prompt foundry, $2.30@2.60; contract foundry, $2.40@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Sept. 25 at 388,884 tons, an increase of 6,417 tons, and shipments at 387,018 tons, a decrease of 3,272 tons.

Buffalo—The price of coke is without material change, but the market is not as strong as bituminous coal, for the reason that the trade has been anticipated too generally. When iron began to move there were a great many idle ovens started up and the result is an overproduction that has hurt the trade considerably. While producers do not like to admit this the jobbers are agreed that such is the case. Prices remain on the basis of $4.30 for best 72-hr. Connellsville foundry and $3.35 for stock coke.

Chicago—Byproduct coke is not so strong, and sales have been made as low as $4.70 for egg and stove. The gas-house demand continues quiet, but furnace and foundry coke are active at firm prices. Connellsville coke has been sold in this market recently at around $2.25 ovens.

Prices f.o.b. cars Chicago per net ton of 2,000 lb. are as follows: Byproduct foundry, $4.90@5.10; byproduct domestic, $4.75@4.85; Connellsville, $4.85@5; Wise County, $4.75@5; gas coke, $3.75@3.85.

MIDDLE WESTERN

GENERAL REVIEW

Domestic buying still brisk. Smokeless situation improved. Screenings stronger. Anthracite buying improved at close of month.

The frosty tinge to the atmosphere has caused some activity in retail distribution and the retailer is coming into the market heavier now that his stocks are dwindling away. The volume of business, except in domestic coals, still continues slightly below that of last year, but prices in every direction are at a noticeably higher level.

A number of Western operators report that they are still sold ahead on domestic lump from two to four weeks. Screenings have declined no further, and if anything have stiffened slightly. An increase in the accumulation of smaller sizes has occurred at a number of mines, and operators are finding difficulty in moving them, but they are not resorting to price cutting.

No "distress" coal is heard of, and it seems to be the attitude of operators to hold coal at the mines rather than to jeopardize prices by forced sales. A decided turn for the better is seen in steam coals; industrial buying of these grades is in greater volume. Lake movement continues to be quite heavy.

CHICAGO

Southern Illinois market stiffer and circulars are advanced at other points. Eastern coals in good demand.

The southern Illinois situation is becoming stronger almost daily. Wholesale buying is quite active, and prices for all coals are much higher than at this time last year. It is felt that screenings have touched the bottom now, being stronger at from 60c. to 70c., as compared with 10 to 25c. this time last year. Shipments into Northwestern territory were very heavy prior to the first of the month in order to take advantage of the advance in rates. No. 1 nut is being bought freely, and No. 1 washed is well held, but the accumulation of other small sizes is causing trouble.

A new circular, effective Oct. 1, was announced by the operators in the Springfield district, which quotes 6-in. lump at $1.75, nut and egg at $1.60, and steam lump at $1.50. The mines have not kept pace with domestic orders received, and screenings have slightly bettered in price. Pronounced activity now prevails in this field.

Very little Knox County coal is moving to Chicago, as most of it is absorbed by the steam trade in territory close to the mines. Clinton No. 4 and Sullivan County No. 6 domestic coals are moving in large volume to the retailers, and circular prices for October shipment are firm at $1.70 to $1.75. The domestic production of these mines is sold ahead for several weeks.

Considerable tonnage of Pocahontas has been delivered by independent producers at lower prices accepted earlier in the season. Mine-run has bettered, but is not at the full circular. The demand for lump and egg has improved. Prices this week have ranged from $1.85 to $2.25 for smokeless lump. Spot shipments of smokeless are light. Splint lump and egg is being disposed of as fast as produced, and prices in the Chicago district and westward are now well held owing to the stronger demand in other directions; 2-in. lump brings $1.25, ¾-in. lump $1.15, mine-run 85c., and slack mixture 40c. No change has occurred in Pennsylvania smokeless prices.

The demand for Hocking lump has been strong in Chicago and vicinity. Jobbers have been paying $1.50 for 3-in. lump, and sales have been made as high as $1.75, which has stiffened domestic sizes. It is said mine-run is improving and that screenings have advanced somewhat.

Eastern Kentucky shippers feel that they will be placed in an advantageous position by the announcement that West Virginia roads have been authorized by the Interstate Commerce Commission to advance rates to Ohio, Michigan and Indiana territory 15c. per ton on domestic sizes.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

West Virginia splint, 3-in. lump, $1.30@1.40: 1¼-in. lump, $1.15@1.25.

DULUTH

Cool weather starts coal moving. Retailers' stocks apparently light. Prices show no improvement.

This territory has had the first real cool weather of the season during the past week, with the result that business in a retail way showed a remarkable increase and the dock companies have been favored with the best week's business of the season. Large shipments of the "rush order" variety were the feature of the week and this would seem to indicate that little coal has been bought during the past summer for fall or winter storage. With the approach of cold weather, dock companies are looking forward to some real business from those points.

Receipts continue to be light, a number of the docks having no storage space available. Prices remain about the same although in a number of instances, concessions have been noted. Quotations per short ton, f.o.b. cars Duluth, are as follows:

	Yough.	Splint	Hock.	Smokeless	Elkhorn
Lump................	$3.40	$3.40	$3.40	$4.75	$3.75
Dock-run..............	3.10	3.10	3.05	3.25	3.25
Stove or nut..........	3.40	3.40	3.40	4.75	3.65
Nut screenings........	2.40	2.40	2.25	2.75	2.40

The demand for anthracite at this time of year is practically governed by the prevailing weather conditions. The cool weather during the past week has created quite a brisk market and the movement to country and interior points has been well up to the average. The dock companies are quoting f.o.b. cars, docks, per short ton, as follows: Egg and stove, $6.85; nut, $7.10; pea, $5.55, and buckwheat, $4.

ST. LOUIS

Readjustment in freight rates unsettles the market. Customary price increases at this time are not made.

When the Utilities Commission overruled the objections to the 5½c. increase in freight rates and gave notice that the increase would take effect Oct. 1, there was a scramble among East St. Louis dealers and steam users to have orders filled under the lower rate. The orders were for lump and screenings. The prices did not advance. The increased rates affected Granite City and all the other East side cities within the switching limits and the buying was as strong in these places as in East St. Louis. There was also some improvement in the movement to Southern and Western points.

Except for this flurry, the market is dull and prices were but little advanced on Oct. 1. Operators do not feel that under the prevailing conditions they can make the customary raise in prices at this time. The market is still overloaded, due to the unseasonable weather.

Quotations f.o.b. mines during the past week have ranged on the following basis per short ton:

	Frk. Co.	Wmsn. Co.	Staunton	Standard
6-in. lump.............	$1.50@1.75	$1.50@1.75	$1.25@1.50	$1.15
2-in. lump.............	......	......	1.15@1.20	1.00
5x6 egg................	1.35@1.75	1.35@1.65	......	1.00
No. 1 nut..............	1.50@1.75	1.50@1.75	......	.85
No. 2 nut..............	1.40@1.50	1.40@1.50	......	.65
No. 1 washed..........	......	1.65	1.40@1.60	....
No. 2 washed..........	......	1.25	1.10@1.25	....
No. 3 washed..........	......	1.25	1.00@1.25	....
No. 4 washed..........	......	1.20	1.05	
No. 5 washed..........	......	.60@70	.50@60	....
Screenings.............	.40@50	.40@50	.35@40	.40

Freight rates from the inner group of mines are: St. Louis, 57½c.; East St. Louis, 37½c. Outer group, St. Louis, 72½c.; East St. Louis, 52½c.

PRODUCTION AND TRANSPORTATION STATISTICS

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for July, 1914 and 1915, in short tons:

	July

GREAT BRITAIN

Sept. 24—Easy conditions continue to prevail. Tonnage is not plentiful and stocks of both large and small coals are becoming heavier. Quotations are nominally as follows:

Best Welsh steam.......	Nominal	Best Monmouthshires....	$5.52@5.67
Best seconds............	Nominal	Seconds.................	4.80@5.04
Seconds.................	$5.52@5.76	Best Cardiff smalls......	3.84@4.08
Best dry coals..........	5.76@6.00	Cargo smalls...........	2.40@2.64

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Outward chartering is a little more active with rates very firm all round. Rates are approximately as follows:

Gibraltar.........	$5.28	Naples..........	$7.68	St. Vincent.......	$5.28
Marseilles........	6.47	Alexandria.......	7.92	Rio de Janeiro....	6.72
Algiers...........	5.40	Port Said........	7.92	Monte Video.....	6.96
Genoa............	7.68	Las Palmas......	5.04	Buenos Aires.....	7.20

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives out contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
866	Water-Works Dept.	Cleveland	Ohio		576
1456	County Government	Portsmouth	Ohio	5,000 bu.	530
1462	Adams Sch. Dist. No. 79	Wheelock	N. D.		530
1472	Board of Education	Alpena	Mich.		531
1476	Essex County Hospital	Cedar Grove	N. J.	10,000	531
1500	Board of Education	Punxsutawney	Penn.		577
1502	State Bd. of Regents	Bismarck	N. D.	4,000	577
1506	N. J. State Prison	Trenton	N. J.		577

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

No. 614—Titusville, Penn.—Bids on this contract (Vol. 7, p. 795), which provides for furnishing the local Board of Education with approximately 2,000 tons of Youghiogheny rescreened nut, slack and three-quarter lump coal, were received until Oct. 4, instead of June 1, as previously announced. Bids are to include cost of delivery in the coal bin at the high-school building. Address Ch. F. C. Kirkpatrick, Supply Com., Titusville, Penn.

+1052—Savannah, Ga.—The requirements on this contract (p. 116), which provides for the fuel requirements for the local Board of Education involved 328 tons last year. The business was let to the Vulcan Fuel Co., at $8 per ton. Address Committee on Supplies, Board of Education, Savannah, Ga.

+1234—Kansas City, Mo.—Purchases on this contract (p. 283), which provides for furnishing the Consumers Bread Co. with approximately 150 tons of coal per month, will be confined to the open market. Address Pres. B. Howard Smith, Consumers Bread Co., Orear-Leslie Bldg., Kansas City, Mo.

1361—Davenport, Iowa—This contract (p. 411), providing for furnishing the Moline-Rock Island Manufacturing Co. and the Tri-City Railway and Light Co. with approximately 75,000 tons of 1¼-in. screenings, does not expire until April of next year. Address G. W. Kuhn, Moline-Rock Island Co., Davenport, Iowa.

+1379—Wheeling, W. Va.—Bids will be received on this contract (p. 447), which provides for furnishing the local Board of Education with its coal requirements during the ensuing year, until 8 p.m., Oct. 18. All bids should include cost of delivery to the school buildings as required. This contract to become effective Nov. 15. Address Clk. Frank Stanton, Bd. of Edu., Wheeling, W. Va.

1441—New Orleans, La.—The award on this contract (p. 490), which provides for furnishing the New Orleans Cold Storage and Warehouse Co. with approximately 3,500 tons of coal is being delayed pending a thorough test of the various coals on which bids were submitted. Address Purchasing Agent, New Orleans Cold Storage and Warehouse Co., Gainnie and Front St., New Orleans, La.

+1484—Sunbury, Penn.—Bids have been received on this contract (p. 576), which provides for furnishing the County Government with pea coal, as follows per long ton: G. A. Nevi, $2.90; C. A. Dagle, $3.05; J. A. Wilkinson, $3.35; J. A. Cross, $3.50; N. B. Boyer, $3.39. Address Controller Aaron Baker, Court House, Sunbury, Penn.

+1497—Cleveland, Ohio—This contract (p. 577), which provides for furnishing the Water Department with approximately 75,000 tons of coal, is now up for consideration, bids having been opened on Oct. 6. Address Comr. of Purchases and Supplies A. R. Callow, 511 City Hall, Cleveland, Ohio.

New Business

+1522—Kearny, N. J.—Bids will be received until noon, Oct. 19, for furnishing the New Jersey Home for Disabled Soldiers with approximately 1,200 gross tons of pea coal, and 100 tons of nut or stove coal. Deliveries are to be made during the year beginning Nov. 1. Address Vice-Pres., Edwin W. Hine, Bd. of Mgrs., New Jersey Home for Disabled Soldiers, Kearny, N. J.

+1523—Williston, N. D.—Bids will be received by the Board of Education of the Williston Special School Dist. No. 1 until 8 p.m., Oct. 12, for furnishing lignite coal as may be required during the ensuing school year. All bids must be accompanied by certified checks for $50, and the successful bidder will be required to furnish a surety bond for $1,000 guaranteeing the faithful performance of the contract. Address Pres. M. J. Borden, Central School Bldg., Williston School Dist. No. 1, Williston, N. D.

+1524—Shenandoah, Penn.—The West Mahanoy Township School for Boys received bids until 6 p.m., Oct. 1, for furnishing and delivering coal as required during the ensuing school year. Address Secy. Maurice Scanlan, West Centre St., Shenandoah, Penn.

+1525—New Hampton, Iowa—The county government received bids until 1:30 p.m., Oct. 11, for furnishing 200 tons of coal f.o.b., New Hampton. Address County Audr. P. E. McGinn, New Hampton, Iowa.

+1526—Minerva, Ohio—The Board of Public Affairs will receive bids until Oct. 13 for furnishing three-quarter coal as may be required during the ensuing year, f.o.b. cars at Minerva. A certified check for $10 must accompany each bid. Address Secy. F. A. Unkefer, Bd. of Pub. Affairs, Minerva, Ohio.

+1527—Flandreau, S. D.—The City Government received bids until Oct. 5 for furnishing and delivering 13 to 15 cars of Youghiogheny lump coal to the City Pumping Station as may be required during the ensuing year. Address City Audr. J. R. Coonrod, Flandreau, S. D.

1528—Memphis, Tenn.—The South Memphis Brick Co. are preparing to contract for their annual fuel requirements involving approximately 10,000 tons of No. 2 lump coal. They have a storage capacity of 200 tons, and deliveries are to be made by railroad as required. Address Pur. Agt., John J. Bishop, South Memphis Brick Co., Madison St., Memphis, Tenn.

+1529—Glasgow, Mont.—The Valley County Board of Commissioners received bids until 2 p.m., Oct. 4, for furnishing and delivering Bearcreek coal for the Court House and Jail as may be required during the coming year. Address Clk. W. B. Shoemaker, Bd. of County Comrs., Glasgow, Mont.

1530—Highland Park, Mich.—The Ford Motor Co. at this place is receiving bids for supplying their annual fuel requirements, involving approximately 25,000 tons of mine-run and 14,000 tons of nut, pea and slack coal. Bids should be submitted on a delivered basis at the company's plant at Highland Park. Address N. A. Hawkins, Ford Motor Co., Highland Park, Mich.

+1531—Wilmot, S. D.—The Board of County Commissioners received bids until noon, Oct. 5, for furnishing and delivering approximately 100 tons of steam coal and 15 tons of anthracite. Address County Audr. O. E. Lien, Bd. of County Comrs., Wilmot, S. D.

+1532—Yonkers, N. Y.—The Board of Contract and Supply received bids until 3:30 p.m., Oct. 4, for furnishing and delivering approximately 200 tons of anthracite broken coal for the Yonkers Tuberculosis Commission. Address Secy. Edwin P. Walsh, Bd. of Contract and Supply, City Hall, Yonkers, N. Y.

1533—International Falls, Minn.—Sealed bids were received by the International Falls School Dist. No. 4 until 2 p.m., Oct. 2, for furnishing Youghiogheny screened lump coal to the public school as may be required during the ensuing school year. Address Clk. School Dist. No. 4, International Falls, Minn.

1534—Washington, D. C.—The Sargeant-at-arms of the United States Senate will receive bids until Oct. 20 for furnishing approximately 50 tons of best extra-hard, white ash anthracite coal, 40 tons of stove ,and 30 tons of chestnut.

Address Sargeant-at-arms, Chas. P. Higgins, U. S. Senate, Washington, D. C.

1535—Bisbee, N. D.—The Board of Education at this place received bids until Oct. 2 for furnishing either 80 tons of Youghiogheny or 160 tons of lignite coal, f.o.b. carload lots at this place. Address Clk. O. M. Ness, Bisbee, N. D.

+1536—Wilmerding, Penn.—The Union High School Board will receive bids until 6 p.m., Oct. 12, for furnishing the High School with coal as may be required during the ensuing year. Address Secy. R. H. Ferguson, Union High School Bd. No. 4, Masonic Bldg., Wilmerding, Penn.

+1537—Le Mars, Iowa—The Haynes County Government is advertising for bids to furnish the Court House, Jail and County Poor with coal during the ensuing year. Address County Auditor, Le Mars, Iowa.

+1538—Wellsville, Ohio—The Board of Education at this place will receive bids until noon, Oct. 18, for furnishing the best grade Pittsburgh 1¼-in. coal to the local school building during the ensuing year. Address Clk. F. H. Eckfeld, Bd. of Edu., Wellsville, Ohio.

+1539—Woonsocket, S. D.—The Sanborn County Government received bids until 2 p.m., Oct. 5, for furnishing the local court house with Hocking Valley coal during the coming winter. Address County Audr. C. B. Jacobson, Woonsocket, S. D.

+1540—Davenport, Iowa—Bids were received until Oct. 2 for furnishing the Public Library with lump coal as may be required during the coming season. Address Librarian, Davenport Public Library, Davenport, Iowa.

+1541—Scranton, Penn.—The Scranton School District received bids until 7:30 p.m., Oct. 11, for furnishing the Scranton Public Schools with stove, chestnut and pea coal and the Technical High School Boiler Plant with No. 1 buckwheat until July 31, 1916. All bids were to be accompained by a certified check for $200. Address Supt. of Bldgs. and Supplies G. E. Haak, Administration Bldg., School Dist., Scranton, Penn.

+1542—Calvin, N. D.—Bids will be received until 6 p.m., Oct. 15, for furnishing the Grey School District with coal. Address Clk. Seacord Whitmore, Grey School Dist., Calvin, N. D.

1543—Frankfort, Ky.—The County Government will receive bids for furnishing coal required at the Franklin County Jail, Residence, Court House,. Poor Farm, and on the road work, during the ensuing year. Bids were asked on lump, nut, slack, and mine-run coal, and bidders were required to distinguish between the cost of the coal and delivery. Address Clk. Crawford Lee, Franklin County Fiscal Court, Frankfort, Ky.

1544—Nebraska City, Neb.—The Otoe County Board of Commissioners received bids until noon, Oct. 11, for furnishing approximately 100 tons of bituminous and 40 tons of anthracite coal. The bituminous coal is to be delivered at the boiler house at Nebraska City, and the anthracite to be f.o.b. cars at Dunbar, Neb. Address County Clk. Louis J. Stutt, Nebraska City, Neb.

+1545—Ocean City, N. J.—The Board of Education at this place received bids until 7 p.m. Oct. 11, for furnishing chestnut and pea coal in carload lots delivered in the bins at the school building as may be required during the ensuing year. Address L. E. Smith, Bd. of Edu., Ocean City, N. J.

+1546—Bridgeville, Penn.—The School Board at this place will receive bids until 8 p.m., Oct. 15, for furnishing approximately 5,000 bushels of coal during the ensuing year. Complete information and specifications may be had on application. Address Secy. W. C. Thompson, School Bd., Bridgeville, Penn.

+1547—Fremont, Ohio—The Public Service Department at this place will receive bids until noon, Oct. 14, for furnishing various kinds of bituminous coal in carload lots as may be required by the local Water-Works during the year beginning Oct. 15. Address Clk. Ralph R. Williams, Dir. of Pub. Serv., Fremont, Ohio.

+1548—Clearfield, Penn.—The Borough School Board received bids until 5 p.m., Oct. 12, for furnishing and delivering coal to the local school buildings as may be required during the ensuing year. Address Pres. A. D. Bigler, Clearfield School Bd., Clearfield, Penn.

+1549—Trenton, N. J.—Bids will be received until 2:30 p.m., Oct. 15, for furnishing and delivering to the pumping station approximately 3,500 tons of bituminous coal and the municipal building about 300 tons. Proposals must be submitted on regular blank forms, accompanied by a certified check for $500, and delivered in person to the city clerk. Complete details and blank forms may be had on application. Address Clk. Frank Thompson, City Hall, Trenton, N. J.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+1100—Columbia, Mo.—This contract (p. 157), which provides for furnishing the University of Missouri with approximately 14,000 tons of coal during the year beginning Sept. 1, has been awarded to the **St. Louis Coal Co.,** on a B.t.u. basis at $2.05 per ton for Nos. 4 and 5 mixed coal and $2.30 for lump coal f.o.b. Columbia. The other bidders on this contract were the Consolidated Coal Co., St. Louis; Stonington Coal Co., Taylorville, Ill.; Whittle & Hockaday, Columbia, Mo.; The Shoel Creek Coal Co., Chicago; The West Virginia Co., Cincinnati, Ohio, and the Big Muddy Coal and Coke Co., St. Louis, Mo. Address Business Mgr. Edward E. Brown, University of Missouri, Columbia, Mo.

+1237—Hamilton, Ohio—This contract (p. 283), which provides for furnishing the Municipal Light and Power Plant with coal, has been awarded to the **Reliance Coal Co.,** Cincinnati, on Bluejacket bituminous from Kentucky. The contract involves approximately 11,000 tons of nut and slack coal and the consideration was $1.84 per ton. Address J. O'Toole, Municipal Light and Water Plant, Hamilton, Ohio.

+1261—Kenmare, N. D.—This contract (p. 324), which provides for furnishing the local Board of Education with coal during the coming season, has been awarded to **James Johnson.** Address Clk. J. M. Rohe, Kenmare, N. D.

+1270—Lake City, Minn.—This contract (pp. 324, 530), which provides for furnishing the Municipal Electric Light and Water Plant with approximately 300 tons of coal, has been awarded on Island Creek coal at $4.65 per ton for mine-run and $3.65 per ton for screenings, both quotations being f.o.b. Lake City. Address Supt. M. J. Stowe, Municipal Electric Light and Water Plant, Lake City, Minn.

1274—Des Moines, Iowa—This contract (p. 324), which provides for furnishing the Polk County heating plant with approximately 3,300 tons of coal, has been awarded to the **Carbon Coal Co.** at $1.90 per ton. The county solicited bids this season through letters direct to dealers, and conducted a series of very exhaustive tests before letting the contract. The pounds consumed, prices per ton, amount of ashes and number of hours of the test, were recorded with the following results:

	Lbs.	Price	Total	Ashes	Hours of Test
Bennett Bros.. .	164,350	$1.95	$159.12	44,370	334
Carbon Coal Co.	131,970	1.90	125.21	26,730	338
Evans-Lloyd. . . .	132,000	1.90	125.47	28,160	337
Dan O'Grady. . .	140,600	1.89	132.87	33,960	. . .

Address Board of Supervisors, Polk County, Des Moines, Iowa.

+1280—Burlingame, Kan.—This contract (p. 324), which provides for furnishing School District No. 7 in Osage County with coal, as may be required during the ensuing year, has been awarded to the **Central Coal and Mining Co.** at $2.90 per ton, delivered. Address Clk. F. M. Nelson, Burlingame, Kan.

+1285—Bay City, Mich.—This contract (pp. 324, 489), which provides for furnishing the County Government with coal for the ensuing year, has been awarded to the **City Fuel and Supply Co.,** at $3.40 per ton for steam lump. Address County Clk. C. L. Fox, Bay City, Mich.

+1306—Billings, Mont.—This contract (pp. 366, 530), which provides for furnishing the local School District with approximately 1,000 tons of coal, to be delivered in the bin, has been awarded to the **Crystal Ice and Fuel Co.** at $3.60 for No. 1 egg coal, $3 for Nos. 1 and 2 nut mixed and $2.60 for No. 2 nut. All coal is to come from the Bearcreek mines. Address Clk. A. J. Thorine, School Dis. No. 2, Yellowstone County, Billings, Mont.

+1329—Plainview, Neb.—This contract (p. 367), which provides for furnishing the No. 5 District School Board with nut coal, has been awarded to the **St. Anthony & Dakota Elevator Co.,** at $5.55 per ton. Address Secy. F. C. Holbert, School Dist. No. 5, Plainview, Neb.

+1334—Parker, S. D.—This contract (p. 410), which provides for furnishing the County Government with approximately 100 tons of Virginia splint coal has been awarded to the Schoeneman Bros. Co., at $6.15 per ton delivered in the bin. Address County Audr. O. M. Rasmussen, Parker, S. D.

1340—Livingston, Mont.—This contract (p. 410), which provides for furnishing approximately 200 tons of lump coal, has been awarded to **A. W. Wiles Lumber & Coal Co.,** at $4.75 per ton for 4-in. lump, and $4.25 per ton for 2-in. lump. Address County Clk. Chas. A. Burg, Bd. of County Comrs., Livingston, Mont.

+1342—**Boone, Iowa**—This contract (p. 410), which provides for furnishing the Independent School District with its coal requirements during the ensuing year, has been awarded to **Racko Bros.** at $3.25 per ton for the best lump Boone coal delivered at the schools. Address Secy. R. T. Duckworth School Dist., Boone, Iowa.

+1343—**Brazil, Ind.**—This contract (p. 411), which provides for furnishing the County Commissioners with coal during the ensuing year, has been awarded as follows: For County Jail and Orphans Home, **Hamlin & Heck Coal Co.,** of Brazil, screened bituminous, $2.15, and mine-run, $1.90; for the County Poor Farm, **John Weideroder,** of Center Point, Ind., screened bituminous, $2.24, and mine-run, $1.99. Address County Audr. W. O. Graeser, Bd. of County Comrs., Brazil, Ind.

+1347—**Sullivan, Ind.**—This contract (p. 411), which provides for furnishing the Board of County Commissioners with a year's supply of coal has been awarded to **R. R. Singer,** Sandborn, Ind., the gross consideration being $10,279. Address County Audr. W. S. Bicknell, Bd. of County Comrs., Sullivan, Ind.

1358—**Louisville, Ky.**—This contract (p. 411), which provides for furnishing the Peter & Burghard Stone Co. with their annual fuel requirements involving approximately 40 carloads, has been awarded to the **Scanlon Coal Co.,** at $1.45 per ton. Address Peter & Burghard Stone Co., 810 So. 13th St., Louisville, Ky.

1364—**Traverse City, Mich.**—This contract (p. 411), which provides for furnishing 7,000 tons of bituminous coal suitable for automatic chain grate stokers, has been awarded to the **Consolidated Coal Co.,** of Saginaw, Mich., on Saginaw washed nut, at $3 per ton delivered. Address Steward George B. Pike, Traverse City State Hospital, Traverse City, Mich.

+1365—**Pittston, Penn.**—This contract (p. 446), which provides for furnishing the local School Board with coal during the ensuing year, has been awarded to **Newcomb Bros.,** the complete list of bids received on this business being as follows:

	Stove	Nut	Pea	No. 1 Buckwheat
Newcomb Bros.	$4.22	$4.22	$3.18	$2.55
J. A. Fitzpatrick........	4.25	4.25	3.20	2.55
Joseph Kelly	4.25	4.25	3.20	2.55

Address Secy. James A. Joyce, Bd. of School Dir., Pittston, Penn.

1366—**Chisholm, Minn.**—This contract (p. 446), which provides for furnishing School District No. 40 with 2,100 tons of Pocahontas mine-run and 225 tons of Youghiogheny lump has been divided equally among the **Range Lumber Co., King Lumber Co.** and **Masaba Fuel Co.,** all of whom bid $5.25 per ton on Pocahontas and $5.35 per ton on the Youghiogheny, f.o.b. bins. Address Clk. M. Tripp, Independent School Dist., Chisholm, Minn.

+1381—**Chicago Junction, Ohio**—This contract (p. 447), which provides for furnishing the Board of Public Affairs with their annual fuel requirements involving approximately 2,500 tons, has been awarded to the **Loraine Coal and Dock Co.,** on No. 8 coal, at $1.05 per ton for ¾ in. and 95c. for mine-run, both prices f.o.b. mine. The contract runs until Oct. 1, 1916. Address Clk. E. K. McMorris, Bd. of Pub. Affairs, Chicago Junction, Ohio.

1383—**Miller, S. D.**—This contract (p. 447), which provides for furnishing the Hand County Board of Commisisoners with coal, has been awarded to **G. W. Van Dusen & Co.,** at $11 per ton for anthracite nut, and $7 per ton for bituminous coal the cost, including delivery as may be required. Address County Audr. D. A. Lewis, Bd. of County Comrs., Hand County, S. D.

+1387—**Missoula, Mont.**—This contract (p. 447), which provides for furnishing the City Government with coal, has been awarded to the **Rock Springs Coal Co.** on Round-Up lump at $6 per ton. The Perry Coal Co. bid $6.25, and the Inter-State Lumber Co., $6.50 per ton for the same kind of coal. Address City Clk. L. E. Harris, Missoula, Mont.

1389—**Yankton, S. D.**—This contract (p. 447), which provides for furnishing the Board of County Commissioners with Hocking Valley coal until April of next year, has been awarded to the **Fred Donaldson Co.,** at $6.60 per ton for screened coal, price including cost of delivery as ordered. Address County Audr. W. O. Nelson, Yankton, S. D.

1392—**Anamosa, Iowa**—This contract (p. 447), which provides for furnishing Jones County with approximately 150 tons of Christopher 6-in. lump coal, has been awarded to **O. P. Hanssen** at $1.40 per ton. Address County Audr. E. J. Hines, Anamosa, Iowa.

Contract Notes

Cape Cod Canal—The Cape Cod Canal management announce that the canal is now open for vessels drawing 20 ft.

Moorhead, Minn.—The contract for furnishing the local schools with coal during the ensuing year has been awarded to **Harris Bros.**

Blue Earth, Minn.—The contract for furnishing the local School Board with coal has been awarded to the lowest bidder, **August Conrad.**

Southern Ry.—It is reported that the Southern Railway has greatly increased its coal purchases in the Barbourville, Ky., district to probably 10% above the normal.

New Orleans, La.—The contract for furnishing the Touro Infirmary with approximately 1,200 tons of Black Creek coal has been renewed with the **C. A. Andrews Coal Co.**

Rugby, N. D.—The contract for furnishing the local schools with lignite coal has been awarded to **Vobey Shute Co.,** and **O. S. Orr & Son** were awarded the contract for furnishing bituminous coal.

Knightstown, Ind.—The Knightstown water-works has awarded its contract, involving approximately 2,500 tons of coal, to the **West Virginia Pocahontas Coal Sales Corporation** on their Panther mine-run coal.

Spain—An American consular officer in Spain writes that a business man in his district desires to represent American exporters of coal. New York City references given. Correspondence should be in Spanish.

Hankinson, N. D.—The Brightwood, Ind., School Dist. has awarded a contract for furnishing and delivering 75 tons of Hocking Valley coal to the Atlantic Elevator Co. Address Clk. H. A. Merrifield, Brightwood, Ind., School Dist., Hankinson, N. D.

Huron, S. D.—The J. F. Anderson Lumber Co. has been awarded the contract for furnishing approximately 400 tons of Youghiogheny screened lump, Pocahontas and anthracite coal to the city government. The prices were: Youghiogheny screened lump, $6.20; anthracite, $10 to $10.25; Pocahontas, $7.80 and $7.55.

Honolulu—A big deal is reported by the "Japan Mail" between the Hokkaido Tanko Kisen Kaisha and the Inter-island S. N. Co. at Honolulu for the supply of 130,000 tons of Yubari coal. The first shipment has just been made. This is the first big export of Japanese coal to Hawaii, which has heretofore bought Australian coal.

New Orleans, La.—The Audubon Ice Manufacturing Co., of this city, which uses about 3,000 tons of coal yearly, is in the market for prices and specifications on run of mine coal. Heretofore they have purchased directly at the mines, not on contract. Address General Manager Audubon Ice Manufacturing Co., Dublin and Hampson St., New Orleans, La.

Marshalltown, Iowa—The County and Municipal contracts at this place have been awarded as follows: For furnishing the city poor with lump coal, **Gregory Coal, Coke and Lime Co.,** $4.50 per ton delivered; for furnishing the County Heating Plant with steam coal to **Blackhawk Fuel Co.,** $2.75 per ton delivered; for furnishing the County Farm with mine-run coal, **Geo. O. Coburn,** $2.87 per ton.

Chile, S. A.—A firm in Chile desires to communicate with American exporters of coal suitable for household use. Imports will be made, if qualities and prices are suitable, in cargo lots. The firm is disposed to place a sample order for 500 tons at once. It is stated that steamers arriving at Chilian ports with coal would have no difficulty in obtaining return cargoes of nitrate or minerals for the United States.

Philadelphia, Penn.—The unusually large exports of coal continue to foreign ports, shipments being made in vessels of all kinds. Three sailing vessels were recently chartered to carry coal to Brazil. As a matter of fact sailing vessels are now being chartered for all ports. Another large order was placed for delivery in France amounting to 2,000,000 tons at a delivered price of $15 per ton, including freight. This coal it is understood will retail in France at from $22 to $27 a ton.

Little Rock, Ark.—The recent awarding of a big contract for coal to the Merchants Transfer Co. by the local school board has precipitated a legal fight. Chanceller Martineau handed down an opinion in which he said that the Board had acted "contrary to public policy" in making a contract with a firm of which one of its members was head, and that therefore the contract was void. The board has canceled the contract and the suit has been dismissed. It is understood that the contract is still open. Address Little Rock School Board, Little Rock, Ark.

COAL AGE

Vol. 8 NEW YORK, OCTOBER 16, 1915 No. 16

Store Checks *vs.* Thrift

A very live question of great interest to most coal men. Let Coal Age readers express their opinions on the subject. Do it today.

THE president of a southern coal company stood and watched a long line of his employees—men (white and black), women and children — standing in the rain awaiting their turn to draw store checks to trade at the company store. Many of the best miners in his employ were represented in the line. Some interesting thoughts were fighting for place in the president's mind, but the foremost one was easily the most startling and ran about like this:

"What does it mean to my company to have to admit that so many of our men are unable to finance themselves and families in spite of full turn and a two weeks' pay? Isn't my labor a rather poor kind and am I not contributing to their condition by issuing store checks from daylight to dark? Wouldn't I have a better class of men if I could teach them the value of thrift instead of discounting their wages each day?"

This man had suddenly come face to face with a gripping problem of every concern that operates a company store on the store-check plan. It is a question that mining men must eventually tackle and settle—whether it pays to have a class of employees who have become so used to the check system that they cannot and will not save enough to tide them over a two weeks' pay or a class of men thrifty enough to do this and who will abhor the check system. We will all admit that thrifty men make the best employees. That is, we know in our hearts they do? because thrifty people buy homes and become settled citizens, and we know they are the best workers in the long run. But that doesn't settle the question, because people who run coal mines know how easy it is to make a good profit out of company stores. Therefore the pocketbook is "touched"—not in the usual way—and the response is evidenced by the too-frequent statement that "mine commissaries are necessities."

If commissaries must be run—and they are often necessary at mine communities remote from towns—should they not be considered secondary to mining coal and be run only to furnish the mining people with life's necessities at the lowest cost?

Can they not be operated for this purpose without the issue of store checks, which is such an easy method of trading that the weak brother can't resist it?

Isn't THRIFT *worth more than store checks?*

If it is, there are ways of reducing check issue so that men can be taught to leave their wages and draw real money twice a month; then pay the bills made at the company store and elsewhere.

Ideas and Suggestions

Mining Coal Without Profit

By Josiah Keely*

Should any worried and tired coal man pick up the *Coal Age,* and his eye light on the subject of this article, let him not be deceived into reading it for the purpose of obtaining a recipe. It is only a protest, and a futile one at that. If he continues to read he will recognize much of the talk he has heard in gatherings of coal men. But what are we going to do about it? Are we going to see the coal beds disappear right before our eyes, without profit either to the producer or to the consumer?

Acknowledging the futility of the protest, we want to hasten to explain that we are not trying to work up an old scare about exhausting the supply. Certainly it will be exhausted, and soon, too; but think of the criminality of letting a good thing go by without profit to anybody, the producer burying half of it in the gob and the consumer burning the rest with no regard to its possibilities. The finished product of millions of years turned back into its original energy, during the few generations of short-lived men, all because it is cheap—those who have it selling it for a song and those who buy it taking the hump and skin and leaving the carcass to rot on the plain.

A Good Chance Being Lost

But do not think we are grieving about the carcass. We leave that to the professional conservationist. What hurts our conscience is the fact that such a good chance to make money is being lost. Here is a chance where the conservationist and the capitalist could work side by side and receive an equitable share of the profits; yet coal is wasted and money lost.

Somewhere in the musty yesteryears someone coined the paradox "coal baron," and anyone with money, provided he lived in the East, came West or sent his money West in order to lose it with greater ease. A system has been built up on which by investing about a dollar a year a ton of coal can be produced, and the exciting game has been started of seeing how many it will take to produce that ton and what it can be sold for. The difference is called the return on the investment.

At first it seemed that if that difference was 10c., that meant a 10-per cent. dividend. Then it was discovered (by a few) that many other investments would return 5 or 6 per cent. without the risks of operating and selling; so this was taken out before calculating profits. Then it dawned on others that when the coal was worked out the original dollar would have to be extracted some way, and a depreciation was estimated and deducted. Then after it was borne in on the wise ones that the smaller the profit on each ton the more tons would have to be produced, the coal industry began to get under way, and the less they gained the more they seemed to be thriving. Thrift is too rare a virtue to pass unnoticed, hence the production tax, the leasehold tax, the income tax, the corporation tax, workman's compensation—and "damn 'em if they do and damn 'em if they don't."

Seeing Which Can Lose the Least

During the process of this evolution the more the investors protested that they were losing, the more those on the outside took it to be the deprecatory modesty of the oversuccessful, and crowed up. But like those of the herd pressing the leaders over a precipice, they were too far away to see them going down, and shoved in, to be in turn later pushed over the edge. Breaking away from this uncomplimentary figure of stampeding cattle, those who have escaped immediate destruction have settled down to an equally exciting scramble of seeing which one can lose the least, and working it on a strictly survival-of-the-fittest basis.

There is a popular game of cards which is being changed continually, either to conform to the development of the science or to stimulate the ennui of its devotees. Nullos was introduced for the player whose hand was so bad that it became a matter of interest how much he could lose, and the winning turned on how many tricks he could lose rather than how many he could take. Many of our operators in their zest for a game of some kind seem to have made it nullos. And so it goes desperately on, and the public is enjoying cheap coal at the expense of conservation and the capital invested.

We wonder sometimes whether that gentleman was pronouncing a curse or a prophecy when he said, "The public be damned!" Defining the public as all of us, it begins to look, to the more pessimistic at least, as if we were going to experience some such oblivion. One branch of the public believes itself sufficiently condemned when capital makes a successful enough organization for self-preservation, but is hastening that condition all the time by making organization necessary. There is not much question but that the condition of the coal industry is pretty generally recognized now by most of those engaged in it, and the knowledge is even permeating to the outer edges of the herd. Not that they have stopped pushing; but the new game seems to be to make a stake and get out of it.

Low Costs at First

Most of us have by now learned that the first half of an operation's life is when the coal can be produced most cheaply. It is mostly solid work near the opening and the coal is easily and quickly put on cars. All the equipment is new and efficient. Repairs are at a minimum. Men are plentiful, not only because they like something new but because they get a better turn and have a shorter distance to walk to their work. It is comparatively easy to arrange a dividend.

The cry is, "After us the deluge." It is even found that the immediate seeming profits can be increased by abandoning half-worked-out mines and opening new ones. This cheap coal is brought into direct competition with that of mines 20, 30 and 40 years old. Sometimes the new mines, when belonging to a consolidation, are carrying the cost of the old mines, which works as a partial solution, although there are several mines yet that are old, or going to be old, that belong to independent interests. It would seem that under present conditions the only hope for these single mines is to take sanctuary under the protecting wing of some consolidation operating new mines and to go over at almost the consolidation's own figures.

---

*General manager, Cabin Creek Consolidated Coal Co., Kayford, W. Va.

As a general rule, economists tell us, price is regulated by supply and demand. The supply has been multiplied as the only way to make a profit on cheap coal—sell lots of it, supply and demand—an old, old saw, or see-saw! Unfortunately the small operation cannot curtail supply and live, and so all those public-spirited men who are howling about trust, monopolies, combinations in restraint of trade and the other necessity-made organizations which their souls hate are slowly but surely rounding up the stampede into something that any captain of industry would be proud to father.

Three Perfect Organizations

Someone has facetiously said that there are but three perfect organizations—the German Army, the Catholic Church and Standard Oil. These are widely differing organizations of opportunity and necessity, and no one can deny that they have showed us things. However, it is hardly my purpose to invoke a triumvirate of the Kaiser, the Pope and John D. Rockefeller to put the coal business on a proper footing. Probably a little less centralized effort would help some, but people never dreamed dreams and saw visions more than today.

Perhaps, after all, the dear public would rather milk one big cow; but they should not forget that in creating a model of heroic size it might assume the other sex with all its traditional disposition to chase. Anyway, if the cheap-coal curse is not solved by someone big enough to save the day it will be solved in the same old way. The enormous capital invested will shrink to a size equal to someone's pocketbook, and the best-filled purses are held by those who have seen the disaster of ruinous competition in time to keep some industries, at least, on a paying basis.

What Is the Remedy?

What are we going to do about it—get together or invite someone big enough to handle the job to come in and take it off our hands? Or have we waited until someone has already got far enough along to tell us what will be allowed for depreciated investment?

Just to wind up this talk, suppose someone big enough for the job already held the controlling stock in the controlling companies of the controlling states, and also controlled the price of competing fuels, such as oil and gas; and suppose this someone controlled railroads which in turn might manipulate car supply, and suppose in this time of oversupply of coal this big man controlled many of the industries which consume the coal, so that they would buy only the coal he controlled at a price he controlled over roads he controlled. Wouldn't that give us a jar? And suppose the big one would further reach out and make prices to those he did not control, so low as to be ruinous to all of us, even though we are selling cheap coal. What are we going to do about it?

⁂

The Theory of Radical Change

An interesting line of thought was recently presented to us while listening to the address of a talented executive regarding practice in the operation of blast furnaces.

The fact that he was talking of the operation of blast furnaces in no way hinders the application of his point to any coal-mine executive, for practice in the operation of coal mines presents about as many varied and baffling problems as the running of a blast furnace.

But to get back to our speaker and his point.

He had made clear the progress of scientific knowledge as applied to his work and illustrated the difference in the practice of furnace masters (?) of other days, who knew that certain results were attained by doing certain things, but did not know why, as compared with present practice of modern executives who do know the "Why." He told about the man whose whole claim to success was based on his ability to introduce "radical changes."

This man had achieved a certain prominence by reason of a little knowledge coupled with successful bluff, and his method of execution was to call his associates together and state his intention to make a "radical change." This was usually accomplished by a disturbance in the whole organization, and the return to normal conditions was achieved a short time later by another "radical change," which put things back about where they were in the first place. The net result was a general unrest all along the line, because no one could tell when the next change would be made or what turn it would take. A short time later this man's company went broke.

There are, no doubt, a good many mining men who have seen the theory of radical change working out in the mining game. Sometimes it comes in the guise of a new manager, who has induced the owners to believe no success can be had unless there is a general shake-up, in which old and loyal employees are torn out root and branch without being given a chance for their alley. Sometimes it occurs in the physical sense, as when some overambitious salesman induces an operator to install machinery that is in no wise adapted to his mine.

No matter how it shows up, management that tries to achieve success with a system of radical changes is opposed to that which quietly accomplishes things without having to resort to such expedients.

The moral of the whole story can be summed up by saying that the executive who will be successful is that man who observes a rule of any well-ordered life—that radical moves (which nearly always are moves without due deliberation) are to be avoided as much as possible.

Doesn't the furnaceman's point strike you as a pretty good one?

⁂

H. W. Martin Believes That as Mines Get Deeper it will be found necessary to convey the air inward in airways used exclusively for that purpose, with no hauling or other work done on them. With such a pure supply of air, men will be able to work in a higher temperature and in greater humidity than can be done when the ventilation is not so good. As to the cost of such a system of ventilation, he does not believe it would be making too high an estimate by putting it as increasing directly with the depth; that is, a coal mine 2000 ft. deep would cost twice as much to ventilate as one 1000 ft. deep.

Motor Haulage and Side Tracks--II

By George S. Brackett*

SYNOPSIS—This is the second and concluding article on this subject. It deals not only with the arrangement of tracks at the junction of animal and motor haulage, but also with those to be built at the junction of main and gathering motors and where two or more straight-haul motors are employed.

When local conditions will permit, it is better to have the complete terminal side track located on the main or face headings and its parallels. This location is more easily converted from a terminal to an intraterminal parting. This transformation, however, is often blocked by insufficient pillar thickness or by the necessity of maintaining the air course. The disadvantage of this location is the increased distance given the mules in coming out from the butt-headings onto the main; but this can be compensated by shortening the butt-headings.

If the plans contemplate placing the individual intraterminal side tracks on the room heading, the extension of the motor haul involves, first, moving the terminal side track forward, and, second, the building of a side track in the room headings. The terminal side track that is located just outside of the first butt-heading should serve the purpose with little change for the first butt alone, when the terminal is later installed at the second or third butt-heading.

Lack of Forethought Delays Changes

Lack of forethought in these matters has often caused the extension of the motor road to be such an expensive proposition that changes are delayed until more than the cost of moving side tracks has been wasted in excessive animal haulage. The economy of animal haulage is contingent upon its confinement to moderate distances. It is unlike the gathering motor in this respect, and to maintain its economy the straight or main haulage must be continually advancing in steps of a few hundred feet.

Figs. 8 to 19 inclusive give illustrations of terminal and intraterminal side tracks. It is hardly the purpose of this article to criticize each plan separately, as such a method may be unjust in view of some of the many local conditions that make the adoption of that particular layout the most feasible. By illustrating the various plans without cavil, their adaptability to any set of local conditions must be determined for each particular mine. Under certain grades the simple runaround is by far the most satisfactory and most conveniently operated side track, both for motors and drivers. Under other conditions it is an abominable nuisance.

On the other hand, if conditions are such that the empties can be pushed into the empty track, the parting may be simplified. It is evident that where the grades are against the loads on the main headings it may be prohibitive for the mules to bring the loads out of the room heading; in fact the empties may drift into the room headings by gravity, saving the time necessary for the motor to pull them in and establishing this as the most favorable location for the parting.

At times the location of the side track most desired by the management is precluded by the air course. Where there are not sufficient grades to assist the motor on the partings, and where the main headings are producing room headings on both sides, it seems advisable that there should be five parallel face headings, the center being the main haul, the next to the right or left utilized for the side tracks, and the extremes for the air return. Four headings are sufficient if room headings are broken on one side only.

In advancing terminal workings it is frequently unnecessary to make a parting at every butt-heading. Assuming these butt-headings to be 300 or 400 ft. apart, there is no difficulty in working the first half of the second butt from a terminal side track at the first butt. In the meantime the first butt has reached its limit with the room cut through to the second butt, near the center of the block. To bring the coal from the upper half of the second butt through this room to the first butt, and thence to the side track, will not give an excessive haul. This will permit the lower half of the second butt to be pillared out completely. The removal of the coal from the lower half of the first butt may be delayed, but it is coal close to the side track, economical to mine and a good asset to have in reserve for the future.

Haulage Conditions Vary Continuously

There is still another consideration in the adoption of any standard side track for universal use in any single mine; that is, the haulage conditions vary from time to time. At times the capacity of the motor haul may exceed that of the drivers, and the mine capacity is limited by the number of cars the drivers can haul. Obviously that parting which is best adapted to the convenience of the drivers is the one to be selected. As the motor haulage increases with the development of the mine there comes a time when everything depends on the capacity of the motor, and we wish for the double-length side track with a center crossover, so that the motor when dropping the empties will be close to and ready to move off with the loads.

Under such conditions, without a second motor, the limit of the haul is reached. By extending it, we only reduce the production. We may be able to put on more drivers and maintain the same output for considerable advancement, although the gathering will not be economical. It is easier to waste money on many drivers than it is on two motors.

Generally speaking, I am more favorable to universally sacrificing motor convenience to the aid of the driver. One or two, or possibly three, energetic motormen are more easily watched and controlled than 10, 20 or 30 drivers scattered throughout the entire mine workings. Furthermore, the more side tracks there are conveniently located for the driver, the fewer drivers are coming into one side track, and better service from these men is the result.

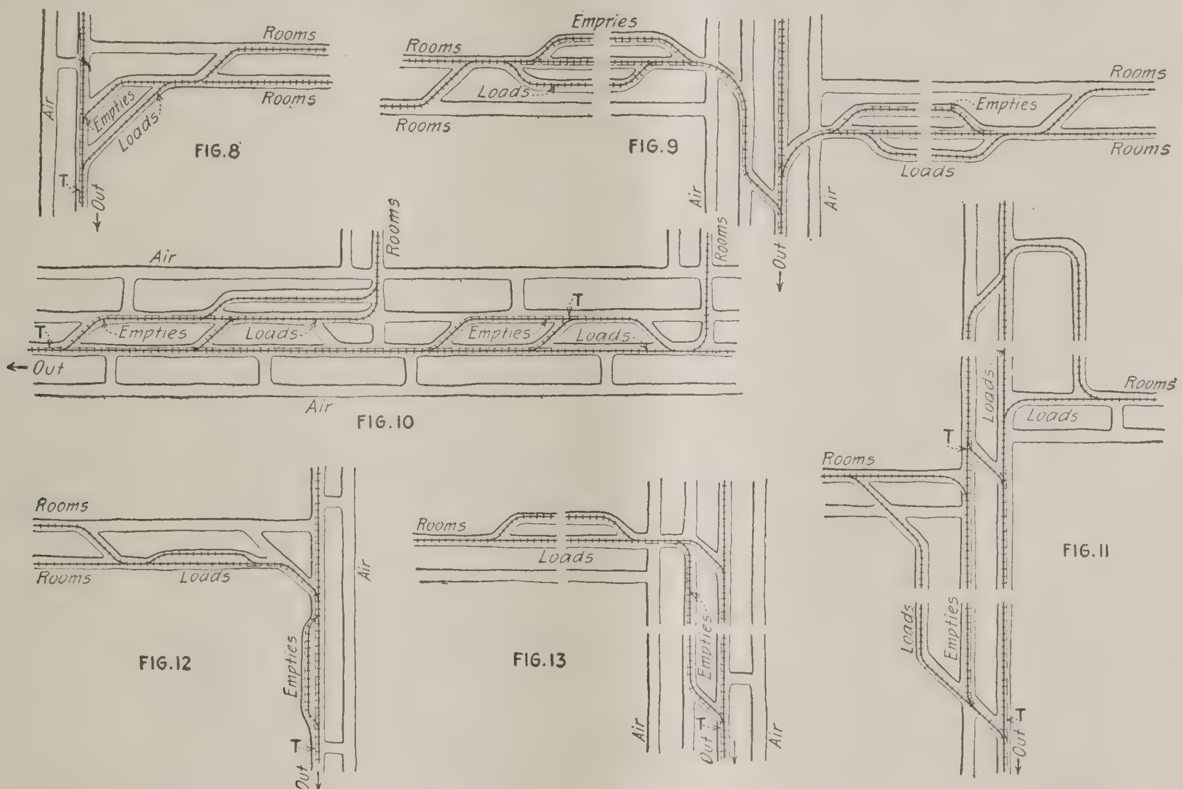
Drivers waiting on the parting for others to come in from the longer hauls is a common defect of operation. The motor should bring loads to the tipple terminal and return with empties, irrespective of the standing loads at the tipple or any delays at that point. It should feed side tracks regardless of standing empties and proceed regularly on its duties independent of meetings or waits or temporary local troubles and delays in the mine. The drivers should bring their loads to the side track, take empties and go so far as possible without waiting for the motor or for other drivers.

---

*Flemington W. Va.

For this to work smoothly there should be an ample equipment of mine cars and generous length of side tracks, with provisions at each for surplus empties. I have seen plants so designed that the motor could not get away from the tipple if any loads from the previous trip were standing nor could it feed the inside partings if empties remained there. There is no economy in operating under such conditions, and there is no reason why they cannot be relieved.

When motors are badly pushed for time and there is danger of increasing the number of side tracks to such an extent that the error of reducing the capacity of the motors is pending, I have concentrated the side tracks by bringing (for instance) coal from the first and second butt-headings to the first parting, and the third- and fourth-heading coal to the fourth-heading side track, either through standing rooms or along one of the face headings parallel with the main. It is not good mining to operate and maintain a side track for a heading which for any possible reason does not produce sufficient coal to keep one driver busy. This driver's haul had better be lengthened and the side tracks reduced.



FIGS. 8 TO 13. SIX TYPICAL SIDE-TRACK ARRANGEMENTS

There are so many different conditions that have to be met and solved that it is impossible to lay down an infallible set of rules, except that whatever is done must be done with a view to keeping every unit of the haulage system working regularly, efficiently and independently of the other units, so far as possible, barring unusual breakdowns and delays.

There are four considerations which determine the length or capacity of side tracks. These are (1) the daily capacity of the workings fed by the parting; (2) the number of trips the motor makes daily; (3) whether or not there is ample mine-car equipment, and (4) the number of loads the motor can haul in a trip.

The Most Important Consideration

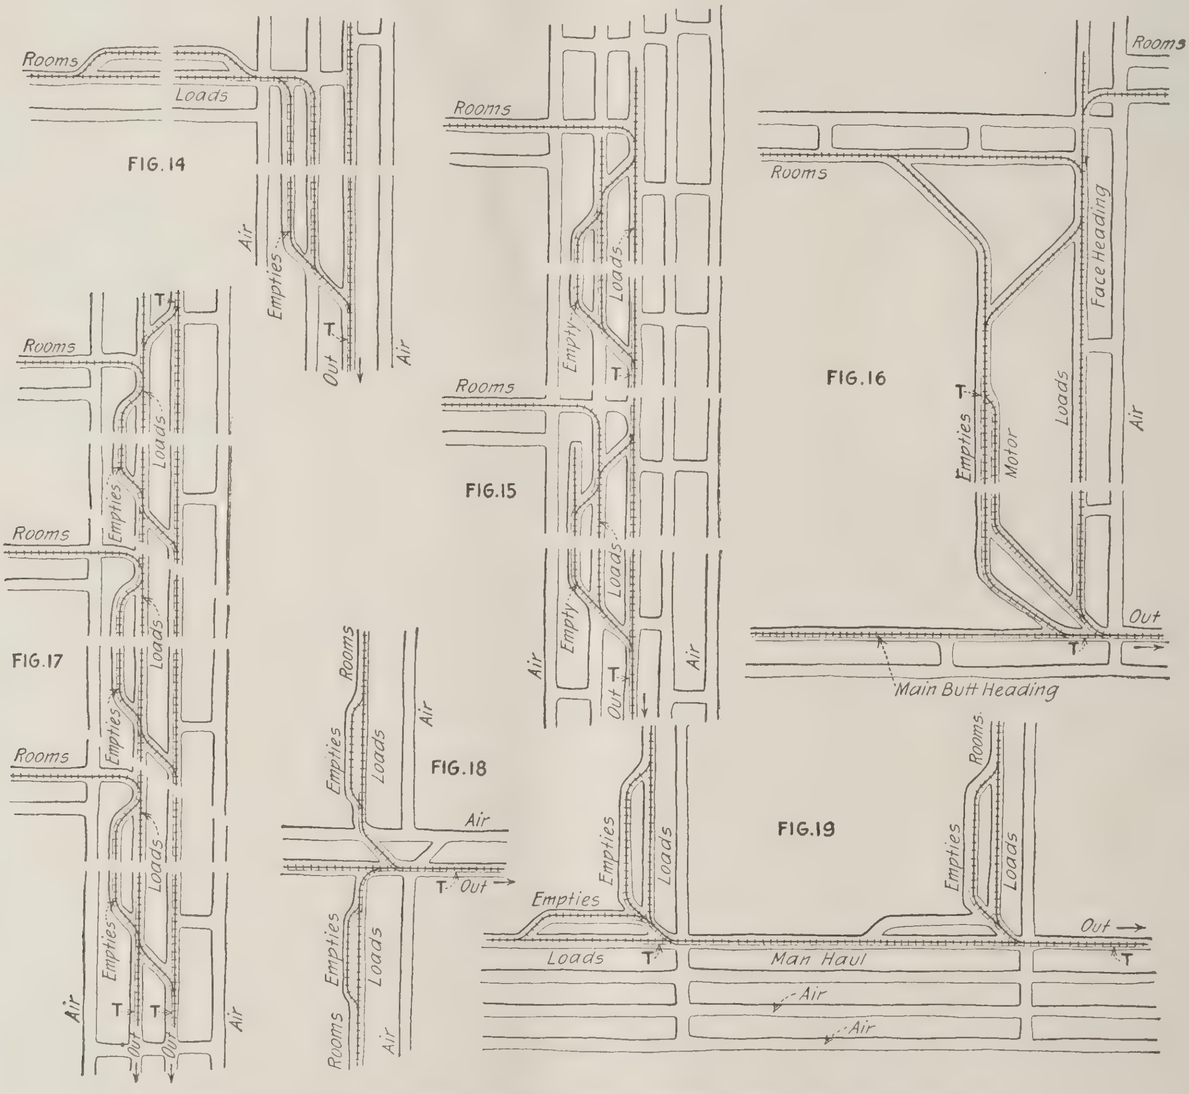
Granting the desired number of mine cars, the most important consideration is the tonnage or length of the trip the motor can handle. It should therefore not be required to feed a particular parting or associated group of partings until this length of trip has been gathered. Instead of the motor making the rounds of all the partings in turn, it should feed the heavy producing sections frequently, while the declining sections should be treated only as the full trip is gathered.

Practically the same general remarks pertain to the junction of main and gathering motors, with this general modification: The economy of gathering motors is not vitally dependent upon a short haul. The installation of the gathering motor greatly lessens the expense of advancing the side tracks to keep pace with the mine workings. There is, however, an economic distance beyond which the gathering motors should not be run. This distance varies with local conditions, grades and capacities of the motors. When this maximum is reached, there develops the necessity for breaking the haul into main haulage and gathering-motor haulage and the question of proficient side-track arrangement must be met. For the uninterrupted working of both these classes of units in the haulage system they should work independently of each other.

Whereas animal haulage must unavoidably fill the side tracks by numerous small trips of loads, the gathering motor may arrange to enter only when it has gathered the full capacity of the straight-haul terminal. Ordinarily the tonnage of the straight-haul motor will be greater than that of the gathering motor, which will involve the straight-haul motor in turn collecting the trip from several gathering-motor terminals.

The question of side tracks resolves itself therefore into whether it is necessary for the gathering motor to make several returns to the terminal in order to gather the required trip for the straight-haul motor and whether several gathering motors are coming into the same parting. To provide for the most complicated case where the loads will not drift into the parting by gravity, where they must be pulled in and where several landings must be made before the return of the straight-haul motor, the siding must be triple length, with two crossovers. It may not be advantageous for the gathering motor to clear the main parting of empties, but the usual room for surplus empties must be provided.

There are such numerous arrangements in the methods of gathering with motors that the planning of any side track is almost impossible unless all the conditions are known. They enter the rooms and pull the loads in some mines, and in others the miner delivers the load to the heading. In some the empties are placed by the motor at the face, and in others the miners push them up. One common arrangement is for the motor to deliver empties only on one heading and gather the loads only from the other heading.



FIGS. 14 TO 19. SIX SOMEWHAT COMPLICATED SIDE-TRACK LAYOUTS

GENERAL PRACTICE IN GATHERING

The grades on the heading may be so steep that they determine whether the gathering is commenced from the first or last room. The usual practice is to install a run-around at the mouth of the room heading in order to let the motor take its position in the rear (going in) of the empty trip.

The illustrations portraying the animal side track show the principal methods of arrangements with numerous modifications. Where the actual conditions and the duty required of the gathering motor are known, these will, with slight changes, serve the purpose. In fact the requirements of the terminals for animal haulage are more numerous than for gathering motors, as these have more power and can shift and push loads under conditions that would be prohibitory for a mule. On account of the greater distance covered by the gathering motor, the intraterminal side track is rarely used.

The next step in the question of motor haulage is met when the distance or tonnage gets beyond the capacity of one straight-haul motor. The installation of the second motor brings us to a decision on the following four points:

1. Whether or not to lay double track on the entire main haul used by two or more motors in common.

2. Whether or not to arrange for the motors to meet at intermediate points, thus splitting the distance into several parts.

3. To provide intermediate passing points, or

4. Whether or not the mine cannot be divided into sections so that each motor shall work a different part and, by a system of signals or the word of a trapper, keep them from colliding on that part of the track used in common.

There is no question concerning the advantage of the double track—it is the surest way to eliminate accidents. Its disadvantage, and what influences most installations, is the expense, and if something nearly as good can be devised with less cost it will be the most popular. Hence the majority of single-track mines. The meeting of the two motors practically answers the same purpose with little loss of time during normal running, provided the meeting place is located at such a point that the inside motor or motors can work the side track on or about on even time with the outside motor. This is not difficult. The advantage is also that there are fewer empty mine cars and loads on the main haul and outside. Furthermore, there is considerable relief where there is a shortage in mine-car equipment.

I have been using this system for many months on a long motor haul. The double track was out of the question, and the scarcity of mine-car equipment necessitated the practice which held the least number of cars on the haulage road. In deciding between meeting and passing at some intermediate point there is little choice, except in the number of mine cars required by each system.

For two motors only, the kind of side track is a simple question when only meeting or passing is required, but as the haulage enlarges and two or more inside motors are necessary, with various times requisite for their trips, the meeting place becomes more complicated and provision must be made for all the motors to work independently of one another. A clear and distinct understanding of just what the side track is required to accomplish is the principal part of its design.

Two Motors Using One Track Is Dangerous

As for two or more motors using part of the main single track in common, without a distinct passing or meeting point, the practice cannot be too strongly condemned. Without adequate electric signals it is dangerous. Even with signals it cannot be operated without great loss of time in waiting. Just as having too many drivers coming into the same motor terminal results in inefficiency, so too many motors coming into the same point can result in nothing but waste of time. One driver from one parting will haul more than half the coal delivered by two, and the average per driver decreases as the number increases on the same side track.

The same applies just as forcibly to several motors on the same terminal at the tipple. There must be delay waiting for the others or in finding out where they are, and always doubt as to where the others are going. This is too frequent at many mines to require much comment, except that it is always policy to keep more than one motor off one track, and if more than one is needed to handle the tonnage, break the haul into parts, allowing one motor only to land on the tipple.

Motor side tracks and motor haulage in general are so dependent on the individual conditions existing in different mines or in different localities in the same mine that a fund of information on what can or may be done is needed in order to adopt the best plan for any particular set of circumstances. The ventilation must never be lost sight of even if it be feasible to occupy both heading and air course at the present time. Whether the two headings will be needed in the future before the side track will be abandoned must be determined.

The economy forced upon the operators in the past few years has been such that ventilation by overcast at each butt-heading has been avoided by the mine management. In its stead a practical and cheaper system of check doors has been adopted and as long as continuous circuit is practicable is continued in effect. While this kind of ventilation is in use it is possible that the air courses at the junction of the butts and mains may be used temporarily. But no such temporary conditions would justify the location of the side track so that the air course cannot be utilized for air when occasion demands.

It Is Unwise To Estimate the Life of a Side Track

It is hardly advisable either to estimate just when a certain side track will be abandoned or a certain section worked out. Regardless of the panel working and pillaring plans, there are sections that cannot be worked as fast as desired and others that it is not desirable to exhaust. Bad top and wet places retard working, and sometimes even prevent it. Sections with excellent mining conditions and close up to side tracks may be held advantageously for other times. The side-track location and design should be such as to meet these conditions, without enhancing the cost on the rest of the mine. Experience is one of the best, although one of the severest, teachers; and assets of developed but unworked coal, particularly in the better sections of the mine, are almost invaluable, and I have seen them husbanded as a miser hoards his gold. In severe labor shortages it is with much satisfaction that we display our array of "good places" to prospective boarding bosses with "maybe ten men."

This is digressing somewhat from the subject, but it emphasizes the necessity of flexibility in the proposed system of motor haulage and the need of its adaptability to all the crooks and turns of good mining practice. If we plan to work our panels with a long pillar line we may be doomed to disappointment. Through careful acquaintance with mine conditions and the labor and market situation and the location and changes that can be made in the motor side tracks, the electric haulage may be adapted to work the mine more advantageously than the most economic mining plans.

⁂

One Mine Inspector Recorded an Explosion that occurred in a place which he was assured had been examined a quarter of an hour before the accident. Stringent inquiries were made, and it was discovered that a miner took a safety lamp down, but as soon as he reached the face of the heading he struck a match to light an open lamp, and immediately the firedamp was ignited. Further inquiries disclosed the fact that at that particular mine the management had so feeble a grip of the discipline that orders were openly defied. In cases of this sort the management is perhaps more to blame than the miner.

Railway Coal-Storage Plants*

SYNOPSIS—Description of a proposed railroad storage plant on the Louisville & Nashville R.R., which involves some unique features. Also some comments on the current practice in general on this type of construction.

Two widely different types of coal storage and handling plants for railway coal supply are described below, and in both of these the coal is stored in open piles.

The deterioration of coal in open piles is not a serious consideration, according to a report to the International Railway Fuel Association by a committee of which Hiram J. Slifer, consulting engineer, Chicago, is chairman. But the coal should be carefully studied to determine the best methods of preventing spontaneous combustion, and it is advisable to store that from different fields in different piles. The report stated that various investigations have shown that with most coals there is very little difference in the heating value, whether stored in the open or under cover, while objections to a covering are the increased cost of the plant and probable interference with the handling of the coal.

Louisville & Nashville R.R. Plant

The coal-storage plant designed for the new Radnor yard of the Louisville & Nashville R.R., at Nashville, Tenn., comprises a semicircular coal pile, which is divided by a semicircular track for a locomotive crane.[1] The coal can be filled in over the ends of the track, leaving only a pocket for the crane. The general arrangement is shown in Fig. 1. This plant will serve both the Louisville & Nashville and the Nashville, Chattanooga & St. Louis railroads. The storage pile will contain about 12,300 tons for the former and 8,200 tons for the latter, while the coaling station for locomotives will have a 600- and a 400-ton bin for the two roads respectively.

The crane will travel on two tracks of 29¼-in. gage, spaced 18 ft. 11 in. c. to c., and will be mounted on four four-wheel trucks, thus having ample stability for swinging. It will have a long braced steel boom, carrying a 5-yd. grab bucket and having a maximum radius of 110 ft.

Coal will be received in hopper-bottom cars and dumped into a track pit, from which it may be fed directly to the vertical bucket hoist of the coaling station, or it may be picked up by the locomotive crane and deposited on the storage pile. To supply the coaling station the crane takes coal from the pile and drops it into the pit, filling it to such height that the coal will flow by gravity into the automatic feeders of the bucket hoist.

The coaling station will be of reinforced concrete, with a hoist tower of structural steel. It will serve three engine tracks. In addition to the coal bins it will have storage for 75 tons of green sand and 10 tons of dry sand. The coal and sand will be raised by duplicate balanced buckets at the rate of 125 tons per hour for both buckets. It will be provided also with four steel weighing hoppers of 15 tons' capacity. The crane will be operated by steam and the hoists by electricity.

A coal-storage and coaling plant of the same type is in operation at Paris, Ky. This has a crane of 80-ft. radius (with 3-yd. bucket) and travels on a single track of 15-ft. gage. The coaling station has only a single bin of 400 tons' capacity, and has no weighing hoppers or sand-handling equipment. A similar plant with 110-ft. crane and 600-ton bin is being installed at Lebanon Junction, Ky. The plant at Paris has not been in use long enough (and has not handled enough coal) thoroughly to test the operation and advantages of the scheme, but it is satisfactory as to its mechanical operation. The only special features of the coaling stations used in connection with these storage plants are the open-back dumping pit and the unusual depth of the feeder and bucket-hoist pit. The cranes were built by the Link-Belt Co., and the coaling-station machinery by the Ogle Construction Co., of Chicago. The plants were designed and built under the direction of W. H. Courtenay, chief engineer of the Louisville & Nashville.

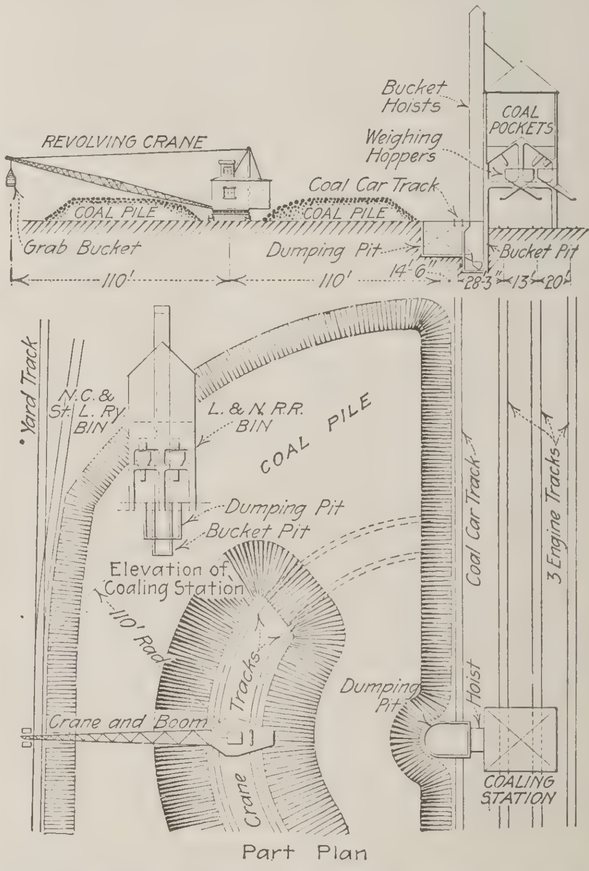


FIG. 1. COAL-STORAGE AND COAL-HANDLING PLANT WITH 110-FT. REVOLVING CRANE AT THE RADNOR YARD, LOUISVILLE & NASHVILLE R.R.

Southern Ry. Coal Storage

Several reinforced-concrete coaling stations have been built recently by the Southern Ry., and at three of these provision is made for storing a supply of coal on the ground and handling this by means of drag-line buckets. The storage piles contain from 3,000 to 10,000 tons each, with a depth of not more than 10 ft. The general arrangement of the plant is shown in Fig. 2.

---

*Abstracted from the "Engineering News."

[1] This system, with a long-radius locomotive crane running on circular (or segmental) tracks, is patented by the Link-Belt Co., which supplied the cranes for the Louisville & Nashville R.R. here described.

The methods of delivering the coal to the storage pile and returning it to the coaling station are quite different from those at the Nashville plant already described. The railway cars dump the coal into a track hopper, from which it is fed by a loading device to an elevating conveyor of the bucket type. This delivers the coal either to the storage bin of the coaling station or to a gravity chute which discharges it at about the center of the storage pile. From this point it is distributed over the area of the pile by the drag scraper, which also delivers coal from the pile to the track hopper and elevator for the supply of the elevated coaling bin.

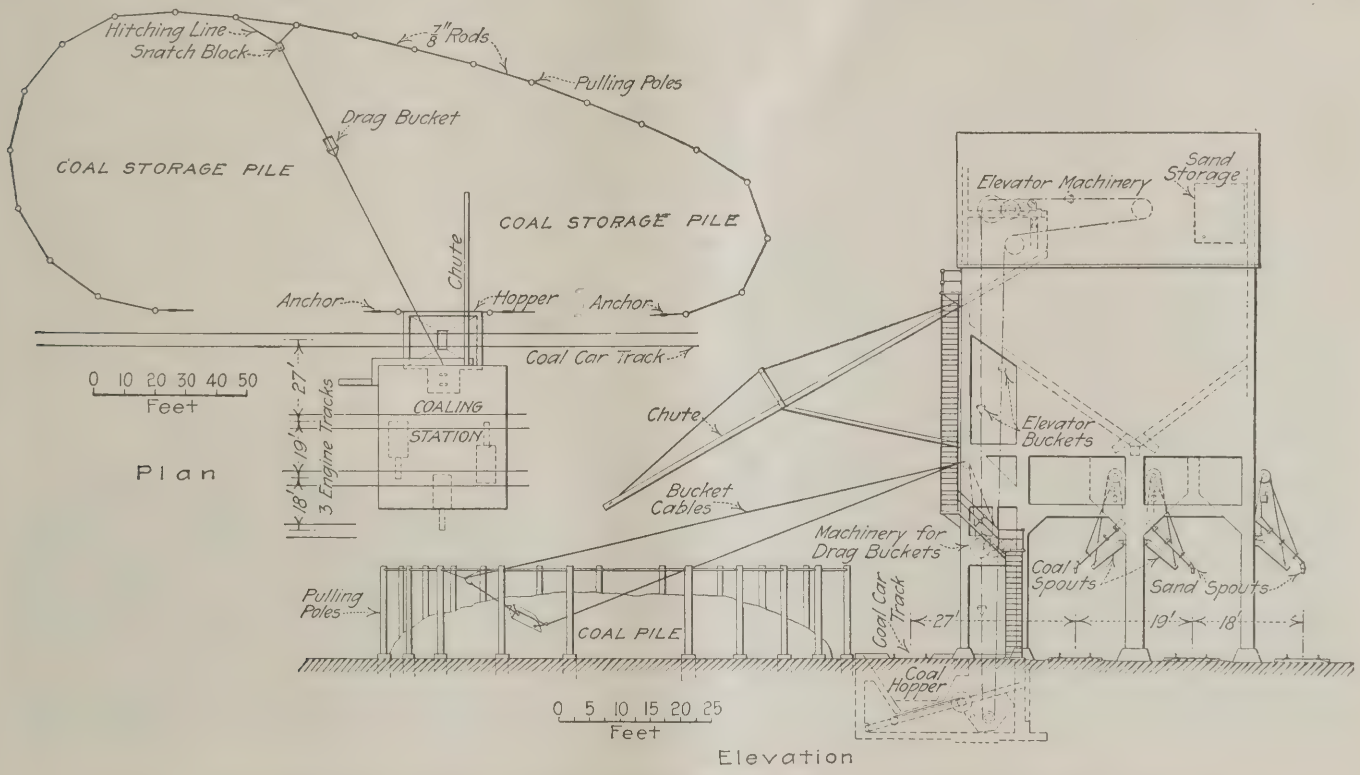

FIG. 2. COAL-STORAGE AND COAL-HANDLING PLANT WITH DRAG-LINE BUCKETS, SOUTHERN RY.

The storage pile is of irregular form and is surrounded by poles about 20 ft. apart for the attachment of the bucket lines. At the first plant these poles (termed pulling poles) were 20 ft. high, but it was found that poles of such height were not practicable without the use of outside guy lines, which would be undesirable. The height was reduced, therefore, to 12 ft. The poles are made of steel H-beams, each set in a concrete base. They are connected at the top by a row of 7/8-in. rods.

The operation of the scraper bucket is effected by means of a double-drum friction hoist driven by a 25-hp. motor geared directly to the countershaft. The hoist and motor are mounted in a housing in the coaling station or on a steel platform over the coal-receiving track. From the drum a steel hauling cable extends to the bail on the mouth of the bucket. The backhaul cable extends to a block hitched to one of the posts and thence to its attachment to the back of the bucket, as shown.

With this equipment the operator can take the coal delivered from the chute and distribute it between this point and the post to which the snatch-block is attached. To reach the space between two posts, lines may be fastened to them and the snatch-block attached to the lines, as shown in Fig. 2. By shifting the block from pole to pole any point within the coal-storage area can be reached.

When it is necessary to supply the bin of the coaling station, the position of the bucket or scoop is reversed, its mouth (or open end) being turned toward the coaling station, as in Fig. 2, the backhaul cable then becoming the hauling line. In this way coal is carried from the storage pile to the receiving hopper, from which it is fed to the bucket conveyor and elevated to the bin. Each plant is equipped with at least two of these buckets, thus minimizing the work of changing blocks and tackle.

The coaling station shown in the drawing serves three engine tracks. The main bin has a capacity of 955 tons, and there are three scale pockets of 15 tons each, making a total of 1,000 tons. It has also a sand-storage bin, with delivery spouts, so that engines can take coal and sand at the same time.

⁂

A Steel Gas Reservoir Exploded in the building of the Society for the Prevention of Cruelty to Animals in New York City recently. The tank, used for asphyxiating dogs and cats, is a steel chamber 5 ft. high, 5 ft. wide and 10 ft. in length. The cats to be killed are placed inside the tank, and illuminating gas from the city mains is discharged into it. In the published reports of the accident the remarkable cause assigned for the explosion is that the sharp claws of the cats inside clawing the sides of the tank must have produced a spark and ignited the contents. It is extremely doubtful whether a material no harder than a cat's claws rubbing on soft steel could ever produce a spark. It may be suggested, however, that cat's fur when properly agitated is one of the oldest and best-known sources of electric sparks. If the tank had been filled with illuminating gas alone, any sparks produced would of course have been harmless, since there would have been no oxygen with which the gas could ignite. Probably, however, as the tank at the start of the process is filled with air as well as cats, a gradual mixture takes place between the air and the gas as the latter is discharged into the tank, and thus an ignitable mixture may be formed. The mixture ignited was evidently not that which could produce complete combustion or the explosion would have been of greater violence.

Trees in the Life of a Coal-Mining Community

By Karl B. Lohmann*

SYNOPSIS—The suggestion is made that great benefits are to be derived from a policy where the liberal planting of trees in and about coal-mining camps prevails. Among the results are added health, added efficiency and added happiness.

A writer tells of a 7-year old Arizona girl who stood dancing under a scrubby cottonwood tree clapping her hands to the rustling leaves. The stranger said to her mother, "Your little girl seems to be much delighted by the tree." "Ah, yes; she may well be so," said the mother. "It is the first tree that she has ever seen."

Fortunately not many of us have lived under circumstances like that. Yet often, with our tree-embowered mountain slopes, valleys and river banks, do we fully appreciate our heritage? Too often we pass trees by or seem to look beyond them, but somehow we look too seldom into them, as it were. They oftentimes become so much a part of our daily lives that we scarcely think of them any more than we do our everyday language. The influence of trees is none the less real; and just as truly as we should miss the power of speaking were it suddenly removed, in the same way we should feel keenly the part played by trees were they no longer with us.

MANY COAL-MINING COMMUNITIES TODAY ARE PRACTICALLY BARREN OF TREES

For those people who have rocked and tossed on the ocean for several days, during which time as far as they might look there was nothing to see but sky and water, how at the sight of land again their hearts thrilled in beholding vegetation that never possessed for them a lovelier green and trees that never seemed more beautiful!

Without verdure, the expanse of ocean and sky at the time was perhaps sufficiently inspirational. It is much the same with the prairies. One can look over them and see for at least twenty miles in any direction without a shrub or tree to interrupt the eye. It fills one with an appalling sense of boundlessness. Yet such inspiration, either of the prairies or of the ocean, cannot compare with our simple woodlands, the soul-spirit of which is the tree.

TREES REGARDED WITH DISFAVOR

Curiously enough, when our first coal communities were established, the surrounding trees were regarded as foes to be vanquished rather than as friends to be protected. As a result they were cut down ruthlessly, with no thought to the future. Not only, therefore, have our first great forests been denuded through the coal regions, but many coal-mining communities as they have grown up have done strangely without forest denizens in their midst. All of our towns were essentially tree communities when they were first settled, and as a result we have today the anomaly of many coal-mining villages practically without trees.

Perhaps the first question we are likely to ask ourselves is what particular good trees may possess in the life of a coal-mining community. In the first place, where intelligently grown, they have economic value. For instance, they add to the value of property. Real-estate people all over the country are aware of this, and whenever they want to lay out a large piece of land into building lots, they usually accompany the development with trees, because a person who is choosing a home, either to buy or rent, will be attracted to the home with surroundings that are pleasant. The street that has trees on it will without a doubt be preferred to the one that has none. So that either from the standpoint of the one who sells or the one who rents, a few dollars' expenditure in trees is well worth while.

More important still, trees have health value in the life of a coal-mining community. Everyone knows that trees are restful to the mind and soul, that they help to modify heat in hot weather, and hence add to the comfort as well as to the health of the people. Then, too, they help to purify the air by absorbing the carbonic acid gases that are exhaled by man, giving back pure oxygen that man needs.

Trees are not only of value economically as well as healthfully, but are of value aesthetically. First, this is true because of the beauty interest that the trees afford at all seasons of the year—in form, texture and color. Second, it is equally true because of the power trees have in uplifting the people. When a coal miner is compelled to choose between the doorstep of his home on a summer evening, where nothing but desolation crowds about him, and the saloon, where light, fellowship and good cheer abound, is it any wonder that he very commonly chooses the latter? Improve the surroundings of the miner's home, help him and show him the proper use of trees—how to make his dwelling a more attractive place—and his temptation to drink will be immensely decreased.

---

*Landscape architect, Wilkes-Barre, Penn.

Also we might ask ourselves how trees might be most appropriately put to use in the life of a coal-mining community. In the immediate home surroundings of the miner, the use of trees commonly understood as such would often be quite absurd. Clearly it would not do for a person to nurture a mighty growing oak in a small backyard, together with a dozen equally luxuriant friends of the forest. So our choice of plants in this case must be confined generally to the very smallest trees, even venturing into the world of shrubs, which after all are essentially nothing less than diminutive trees.

No plantation should be the result of a hit-or-miss scattering of these over the home surroundings. We must strive to provide areas in the yard for special purposes, much like certain rooms in the house that are set apart for particular functions. For example, if there is to be a vegetable garden, then a piece of ground for such purpose ought to be set aside. If there is opportunity for a garden or open green space beside the house, every means should be availed of to make it for what it is intended. Successfully designed, the development of such an area out of doors may reveal privacy, permanence, peace, restfulness; may invite one in summer to outdoor life, may present views on a small scale and promise to grow lovelier and more valuable every year.

Trees Most Suitable for Planting

Not only may there be practical use for the trees in serving to improve the immediate surroundings of the miners' homes, but they may admirably help to make attractive the streets of a coal-mining community. Their choice for this purpose, again, is governed by certain limitations. There is for example the question of hardiness; that is to say, trees which are chosen must be able to endure the climate, the soil, drought, smoke and dust. They must have strength to resist winds, sleet and snow, and they must have the ability to endure transplanting and to propagate easily. The trees must be immune from insect attack; they must have straightness and symmetry; they must give shade; they must be clean, and they must be long-lived. Examples of the best would include the oriental plane, the American elm, the red oak, and the sugar, as well as Norway maples.

And useful as trees may be in the beautifying of yards and streets, they can be put to no more worthy service than in helping to beautify pleasure grounds in a coal-mining community. Trees, indeed, are an invaluable accessory of most pleasure grounds and play areas.

The usefulness of play as well as the need for it around school buildings is generally admitted. There ought certainly to be more general provision of the kind. Trees intelligently planted will be fruitful, not only in making the school grounds a pleasanter place wherein to play, but also in adding to the beauty and attractiveness of the school.

A great many coal-mining villages, moreover, possess other places of work besides the school, and they should be remembered in the way of pleasure grounds for their workers. For example, there are factories where often it would be practicable to provide near-by park areas with plenty of shade and verdure, where employees might spend health-building noon hours. Pleasant grounds to look out upon occasionally help to ingratiate further the employer in the hearts of his toilers.

Where To Plant Trees

The typical center of all workaday activities in a coal-mining community is of course the coal mine. The rumble and tear of breakers and tipples, with their outlying workings, is familiar to those who live in such communities. What about introducing trees into the surroundings of those breakers? Most breaker-yards from the standpoint of appearance are certainly chaotic and desolate. Some few mine officials insist that "breakers are breakers, and you cannot make anything else out of them." Nevertheless attempts are being made, and more will be made, to change the appearance of such surroundings. Efforts of this kind will benefit all concerned—the pride of the owners and operators and the comfort and pleasure of the men who emerge from the darkness of the earth. The green of the trees will help to reignite the latter's hope and enthusiasm in life, to say nothing of what it will do ultimately toward helping in the uplift of living in the coal-mining communities.

IS IT ANY WONDER THE MINER PREFERS THE SALOON TO THIS?

Urgent as may be the need for trees in creating pleasure grounds associated with the various places of work, the call for them in helping to create public breathing places, playfields, park areas for the community at large to enjoy is equally pressing. The bordering lands just outside of the village or town, or those areas still unused and suitable within, ought to be preserved and developed for such purposes. This is not only a timely suggestion for the people who are to enjoy them in this day, but it is a provision as well for those still to come. Nearly every community has hope of growing and developing. Why not initiate early in the life of a mining town a park policy that will make for the beautification and betterment of that future community?

And for this kind of development, or any others, the earlier that requisite trees are planted the sooner will be enjoyed their maturity as well as fruitful service for good.

The value of trees in the coal-mining region is by all means real—the need of them unmistakable. They have economic value, they have health-giving attributes, and they are endowed by God-given beauty. Let us pledge ourselves, therefore, to the very prompt reinstatement of these, our forest friends. And in so doing we shall contribute to a score of mining towns and villages added efficiency, added health and added happiness.

Coal Situation in the Warring Countries

The American Association of Commerce and Trade in Berlin makes the following interesting analysis after a year of the war:

The coal production by metric tons of the important European countries in 1913 is shown in the following figures:

Country	Coal	Brown Coal	Total
Germany	191,511,000	86,475,000	277,986,000
Great Britain	287,044,000	....	287,044,000
Austria-Hungary	17,762,000	35,663,000	53,425,000
France	40,129,000	793,000	40,422,000
Belgium	22,846,000	....	22,846,000
Russia	30,745,000	....	30,745,000

The coal output of Great Britain is exceeded by the United States only. The British exports in 1913, also in metric tons, were as follows:

France	12,775,000	Denmark	3,034,000
Germany	9,646,000	Norway	1,900,000
Italy	8,952,000	Spain	3,648,000
Russia	5,999,000		
Sweden	4,553,000	Total	50,507,000

The British output in 1914 was reduced by the following causes:

1. Approximately 200,000 miners joined the colors.
2. Lack of timber used for mines, which was declared as contraband by Germany in regard to shipments from Russia and the Scandinavian countries.
3. Difficulties in transportation.
4. Strikes.

Therefore until December, 1914, exports decreased by one-half as compared with 1913, and for 1915 the decrease in domestic consumption is estimated at 27,000,000 tons on account of reduced activity in the industries, and the decrease in total production is figured at 53,000,000 tons. Coal exports in time of peace take place from South Wales via Cardiff, and from Newcastle and the Tyne shipments are made to London, Germany, the Scandinavian countries and Russia.

Decreased outputs resulted in higher prices and in an embargo on all exports, excepting to the British colonies. In order to put an end to continued rise of foodstuffs, increased cost of labor and increasing cost of coal, maximum prices for coal may be established. The Scandinavian countries seem to have insured their English coal supply by energetic measures.

Different, however, is the situation in Italy, which country, without any notable coal production of her own, in 1913 imported from England 9,000,000 tons and from Germany (including coke) 2,000,000 tons. Shipments from England in the period from January to May 11, 1915, were 1,250,000 tons less as compared with the same period of former years, while shipments from Germany increased by 100,000 tons.

Judging from all indications, it will be difficult for England to satisfy Italy in the matter of coal supply, inasmuch as freight charges caused by the lack of steamers have considerably increased. According to information received from Rome last March, increase in ocean freight rates varies from 600 to 700 per cent., and it is expected that the announced American shipments will be very expensive for the same reason.

At a consumption of normally 61,000,000 tons the domestic production reaches 41,000,000 tons per year. Imports take place from England (12,000,000 tons) and Germany (5,000,000 to 6,000,000 tons), with the remainder from Belgium.

The territory in northern France occupied by German troops furnished in normal times 27,500,000 tons, and the southern districts of St. Etienne, Alais and Le Creusot only 12,500,000 tons. Considering the lack of labor and difficulties in transportation at the present time, the entire French coal production can be estimated now at 6,000,000 instead of 41,000,000 tons, as in normal times.

Shipments from England are decreasing, and in the period of January to May 11, 1915, shipments decreased by 1,000,000 tons as compared with the same period in times of peace. The Paris *Temps* states that shipments to Paris in the second half of November, 1914, amounted to 80,000 tons as compared with 300,000 tons, which are required normally.

Coal prices and ocean freight rates have continued to rise since January, 1915.

European Russia has a peace production of 31,000,000 tons of coal per year, while imports in 1913 amounted to 9,000,000 to 10,000,000 tons, of which 6,000,000 came from England and 2,500,000 from Germany.

Since the coal district of Dombrawa, in Poland, has been in the hands of the Germans for some time a loss of 7,000,000 tons must be figured, while the production of the coal district of Donez (Charkow) has decreased by 30 per cent. Since English imports via the Baltic and the Black Seas have ceased entirely, there remain for domestic consumption approximately 20,000,000 tons only.

On the other hand, it should be remembered that in Russia oil, wood and peat are used to a great extent in place of coal.

For reasons that shipments of American coal via Vladivostok are very expensive, owing to high cost of transportation via the Trans Siberian railroad, it is evident that the Russian coal supply is rather limited.

In spite of increasing production during the war, the output is remaining behind normal. Exports to Italy, France and Russia have ceased, while considerable shipments are being made to Austria and other neutral countries, such as Sweden, etc.

English imports, of course, usually amounting to from 9,000,000 to 10,000,000 tons per year, have stopped. The importance of coal exports in exchange for foodstuffs manifests itself now in the trade with Rumania, as it formerly did with Italy.

As things stand today Germany and Austria dominate the coal market in northern France, Poland and the Balkan states, and it seems that they are able to meet the demand without any difficulty.

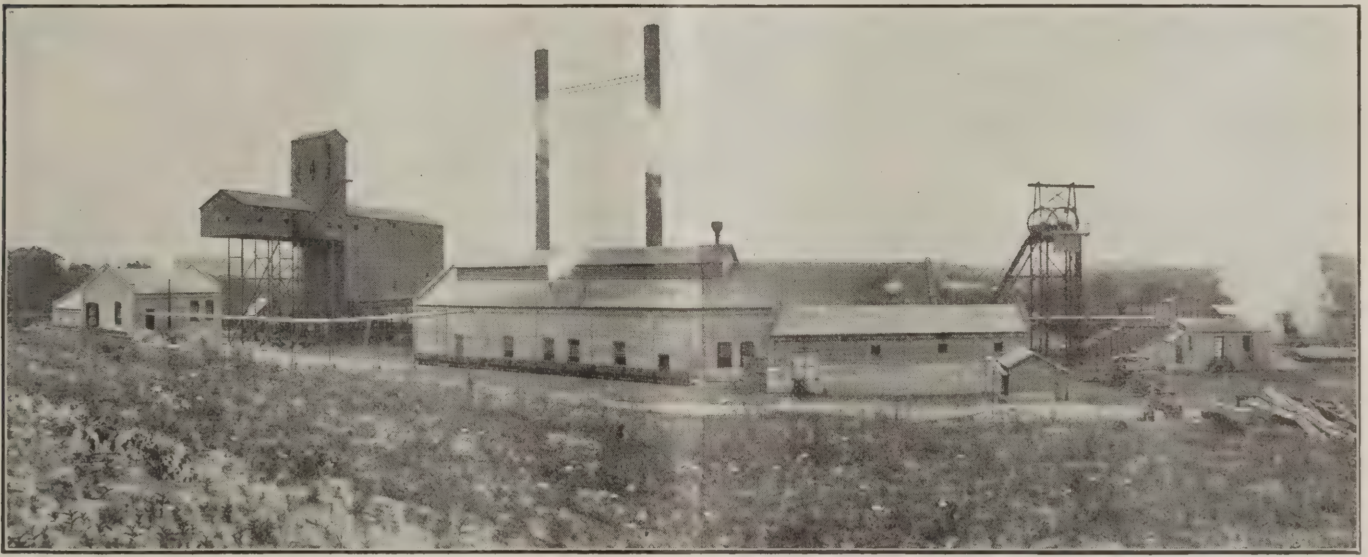
Switzerland is not furnished now with coal from France or Belgium, but is well supplied from Germany. Germany need not fear a coal famine.

An Interesting New Pennsylvania Coal Mine

By R. G. Johnson*

SYNOPSIS—Description of a plant where the construction work was designed and carried on with an idea of permanency. The shaft is concrete-lined and fireproof. Its general design is unique. The surface equipment at the mine is the last word in uptodate engineering.

Modern shaft-mining plants designed for permanency are in most locations as economical today as the plant which was formerly considered a 15-yr. or 20-yr. installation. Concrete-lined shafts with steel buntons in many parts of the country will cost no more than timbered shafts. Steel construction will cost only little more when erected over the shaft than the timber headframe, tipple and bins. It must seem folly, therefore, in a long-time operation to put up timber headworks in any but a timber country, remote from the steel-making centers. Modern power-plant equipment, with its many steam- and labor-saving accessories, is higher only in first cost and soon more than pays for its incidental increase in price. All along the line of mining-plant requirements the higher first-cost argument against the better equipment is receiving its death blow.



SURFACE PLANT, BERRY NO. 3 MINE, BAIRDFORD, PENN.

The Ford Collieries Co., of Detroit, owning and operating mines with a daily capacity of 5,000 tons in the Freeport seam of coal about 17 mi. north of Pittsburgh, Penn., was firm in its belief that the better equipment is the cheaper when planning the construction of the plant for its new Berry No. 3 mine, located at Bairdford, Penn., about 3 mi. from Curtisville on the Bessemer & Lake Erie R.R. In this immediate section the upper and lower Freeport seams come together about 200 ft. below the surface, the two being separated by a 5-in. parting of slate. The country is not a wet one, as far as sinking goes, but the coal has some water in spots.

The area tributary to the new shafts is about 2,500 acres, the seam averaging a little more than 6 ft. in thickness. The floor of the coal is generally regular in grade and the roof is of firm sandstone, so that other roof support is seldom required. Various analyses of the coal show it to conform closely to the record given below:

Moisture	0.99	Volatile carbon	37.58
Sulphur	0.82	Ash	4.64
Fixed carbon	57.78	B.t.u.	14,709

About 25 per cent. of the output of its various mines goes to the coal company's allied industries in Michigan, the remainder being shipped to various railroads for locomotive fuel.

General Design of Shaft

At the start, A. R. Pollock, the general superintendent, talked over the matter of shafts with the Dravo Contracting Co., of Pittsburgh, and his requirements as to car size and output were incorporated into plans and specifications, the general design being a concrete-lined section, with flat sides and arched ends.

With the grouting process for sealing water-bearing strata penetrated in the sinking, developed as it is, it is possible to sink and line a shaft with concrete under most conditions without water rings. By forcing in cement mixed with water to the consistency of a cream, either in the rock strata before sinking through them or through the lining and into the crevices, the shafts can be made practically water-tight. This feature in the new specifications for concrete-lined shafts appealed most strongly to the coal company, and was adopted by it as being certainly an advisable measure to take.

There were no interruptions to the operation of sinking or lining, nor were there any unusual circumstances delaying progress. Each shaft was sunk a distance of 40 ft. before a stretch of lining was started. Jackhamer drills were used exclusively in the sinking, always handling their work in good shape. The rock consisted for the most part of clay shales and sandy shales, with very little sandstone and limestone. There was therefore little rock in the shafts that could be used for concrete aggregate, it being necessary to haul most of the sand and gravel nearly 4 mi., 3½-ton Packard motor trucks hauling the materials.

---

*Engineer, the Dravo Contracting Co., Pittsburgh, Penn.

Fireproof Construction

The shafts were designed to be as nearly fireproof as possible. The linings are of concrete, as is the partition wall separating the supply hoistway from the air compartment in the air shafts. This wall is 5 in. in thickness, reinforced with triangular mesh, and was erected in panels between the steel 8-in. H-beam buntons, laid on edge on 5-ft. centers. The stairway is of structural steel, the treads and platforms being of Diamond raised plates. The accompanying photograph of the air shaft shows a view looking down at an angle from the top toward the stairway end.

The hoist-shaft buntons are also of steel, a 34-lb. section of 8-in. H-beam being used here as in the air shaft. The guides in both shafts were of prime long leaf yellow pine, in long lengths. The splices in the guides in the shaft were different from those seen in the photographs of the shaft tops, which show a short half-together splice, whereas butt splices were used below the surface.

The arches at the hoist-shaft bottom are unique in that buntons are left out entirely, thus obviating the necessity for the concrete columns usually placed on each side of the shaft at the junction of the shaft and the arch. This column is usually placed as a support for the ends of the buntons to which the guides are attached. The change made it necessary to stiffen the guides by placing a steel channel behind one end guide and an I-beam between the two middle guides. The decided advantage of course is the absence in the shaft bottom of the bulky construction which always hinders the passage of air at this bend in the air course, and which always takes up space where roominess is so much desired.

LOOKING DOWN THE HOIST SHAFT

What water was struck in the shafts was grouted off through the lining at a very low cost, so that the shafts are absolutely dry.

The power plant at this mine of the Ford company consists of two batteries of two boilers each of Erie City horizontal return-tubular type, fired by Taylor stokers fed from hoppers filled by a belt conveyor from the coal tipple. Green fuel economizer blowers produce forced draft, the blower engine driving the stoker shafting.

SHOWING STEEL STAIRWAY IN AIR SHAFT

Ashes from the stoker grates are hauled in an electric larry through a tunnel built for this purpose underneath the front of the boilers and carried out at grade to dump about 200 ft. away. A 1,500-hp. Cochrane feed-water heater with two Dean Bros. feed pumps supplies the boilers.

Engine-Room Equipment

In the engine room two Erie ball engines drive two General Electric 200-kw. direct-current generators, the exhaust steam being piped in trenches to the heater in the boiler room, where is situated also the engine for hoisting the man and supply cage in the air shaft. This engine is a Vulcan 16x20 geared, equipped with a Nicholson overwinding device with an 84-in. drum counterweighted, the counterweight being operated in the air compartment of the air shaft on guides fastened to the center buntons. A Westinghouse 3-phase 2,200-volt alternating-current motor generator of 60-kw. capacity is also located in this room. This unit supplies light to all houses in the mining town. The main hoist engine is a 22x36 Vulcan with conical drums 8 ft. in diameter. The headframe and tipple are the work of Heyl & Patterson, of Pittsburgh. The fan at the air shaft is a Jeffrey, reversible type, of 350,000-cu.ft. capacity, with an Erie ball-engine drive.

The plant is designed to handle 3,000 tons of coal per day, and the life of the mine is figured at 35 yr. The shafts and their appurtenances, together with all foundations and mine buildings, were designed and built by the Dravo Contracting Co. under my supervision, with Samuel Vance as resident superintendent. G. G. Long was engineer for the Ford Collieries Co.

⁂

Some Time Ago a Fatal Accident Occurred in consequence of a miner heating his explosive in an oven. This is perhaps a much more common method of "getting the explosive into condition" than is usually suspected. Among other ways of attaining the same end is the practice of carrying the explosive next to the body. The miner who is guilty of this habit may indeed be said to be a walking danger, not merely to himself, but also to his companions. The advice to the miner who does these things may be given in one word: Don't.

New York City's New Coal Specifications

SYNOPSIS—Comments on the new coal specifications from some of the leading members of the local trade are presented herewith. The penalties prescribed are regarded as excessive and the ash- and heat-unit standards as impractical. Exception is also taken to method of sampling.

The tentative specifications for the purchase of coal for the various New York city departments which were printed in *Coal Age* of July 24 are soon to be taken up for final action by the Board of Estimate and Apportionment. City Chamberlain Henry Bruere, who is chairman of the Central Purchasing Committee, has sent a letter to all dealers doing business with the city asking them to submit any criticisms or suggestions they may have concerning the city's way of doing business. Some of the dealers have already replied to this letter, and Mr. Bruere will embody these criticisms and suggestions into a report. Should the trades desire it, there is no doubt that they will be accorded a hearing, at which time they can have the opportunity of presenting their complaints.

PATTISON & BOWNS CALLS IT HARDSHIP

Pattison & Bowns is of the opinion that "the standard in force is a great hardship to anyone doing business with the city and is not for the best interests of all concerned, since it tends to lessen competition in many ways.

"The standard of ash called for in all sizes of anthracite coal is too low and can be obtained only from a few small operations. It is a well-known fact that these smaller mines which produce an unusually high grade coal send their product to the markets that pay the best price, and only send it to tidewater during times of depression. The standard of ash should be raised so as to conform with the standard of the coal produced by the majority of the large companies. This is especially so for the reason that the City of New York does not pay a premium, and it is not fair to have a standard that is so difficult that it can only be reached occasionally.

"The B.t.u.'s called for by the specifications are too high and should be lower for the same reason. The method of dividing the city into zones is unwise for the reason that a wholesaler finds it very difficult to bid on a zone which contains institutions that buy by cargo lot and also require retail deliveries. Under the old method of buying coal for each institution, wholesalers were able to bid on every institution that could receive boatload deliveries.

"By the present methods, many institutions of this character are put in a zone with others that require truckload deliveries. This is surely a hardship to the wholesalers and is not in the interest of the city."

IMPRACTICAL FEATURES

An official of one of the companies which has transacted considerable business with the city characterized the specifications as "the most undesirable that have ever been offered to the coal trade." He says further:

These new specifications provide for raising of the standards and doubling of penalties, while there is an absence of any provision for arbitration of disputes, lack of any attempt to correct the improper methods of sampling, and lastly, an arbitrary power is still invested in the city laboratories.

In view of the fact that the city does not pay premiums, it seems unfair to further raise the standards. It has proposed to make the ash standard on No. 3 buckwheat 16 per cent. and the B.t.u. standard 12,400. This is restricting the ash standard three points, from 19 per cent. down to 16 per cent., and raising the B.t.u. standard 400. The standard on sizes has also been raised.

According to the new specifications, coal must pass through a clear opening of 3/16 in. and over a clear opening of 3/32 in. The standards of the large mining companies, upon which dealers are dependent for their supplies, are for coal to pass through an opening of ⅛ in. and over an opening of 1/16 in. The large producing companies do not seek the city business; they naturally will not guarantee the specifications. Therefore, the dealer is obliged to guarantee to the city a product which he cannot buy. In the case of bituminous coal, the ash percentage has been lowered from 10 per cent. to 9 per cent., which means raising the standard 1 per cent. The B.t.u. standard has been increased from 13,800 to 14,000.

INCREASED PENALTIES

In addition to raising the standards as stated, the penalties have also been increased. Coal containing ash up to 12 per cent. is penalized as formerly at the rate of 1 per cent., but should the ash exceed 12 per cent. the penalty is double; that is, deductions are made at the rate of 2 per cent. for ash in excess of 12 per cent. The same system is proposed with respect to the British thermal units. The penalty is 1 per cent. for each 100 B.t.u. down to 13,500 and 2 per cent. below 13,500.

A contractor could very easily suffer a penalty which would amount to practically the confiscation of his coal. Take such a product as No. 3 buckwheat, which is sold to the city very often on the basis of not over 60c. per ton at the mines—the delivered price on this would be approximately $3 per ton. A penalty of 20 per cent. would not only wipe out the profit on the coal, but the entire cost of the coal itself, and a 20 per cent. penalty would not be at all unusual under these specifications. The same would be equally true of bituminous.

The "remission clause" which is to be adopted for the purpose of allowing a contractor to average up some of his losses is entirely inadequate and will not prove any inducement to an intelligent bidder. With the system of sampling and analyzing designated and with no proper provision for arbitration of disputes and absolutely no adequate check analysis provided for, a contractor would not be able to benefit by this "remission clause." This provision has been explained in a previous article (see p. 122 of the current volume).

When the contractor delivers coal which is subject to a penalty, he may be permitted to deliver a like tonnage of better coal; and if this analyzes above the specifications, he will be given credit for a premium on as much tonnage as that on which he has been penalized, excepting that he shall receive no credit against penalties on the 2 per cent. basis. In other words, if a contractor has supplied coal which is penalized on the 2 per cent. basis, his case is hopeless. In order to receive a remission on even a portion of his losses, he would be obliged to purchase a grade of coal which is practically unobtainable, and even granting that such coal could be had, the extra cost of same would be prohibitive.

In conclusion, it may be said that for a coal dealer to obtain city contracts he must sell cheaper, submit to more discourteous treatment, wait longer for his payments, allow more unwarranted deductions and supply better coal than he does to his ordinary customers. The number of bidders on city contracts has been gradually diminishing, and competition will grow steadily less until specifications are adopted that give the dealer a better chance. Raising standards and increasing penalties, which are already doubled, is the surest and easiest way to discourage competition.

POOR SAMPLING CAUSES TROUBLE

Another dealer comments further on the fact that the penalties are such that they could readily more than absorb the profit. He says:

When it is considered that the city penalizes two or three times for the same offense, it is apparent to anyone that a very slight falling off in quality entails an actual loss. There is usually only about 10c. per ton profit in coal here, and for this small profit dealers have for years been guaranteeing to meet the specifications at the same prices and even less than they are obtaining from private consumers, without any guarantee as to quality.

During the past five years a certain dealer has delivered to the city on various contracts approximately 1,000,000 tons of bituminous coal, the average price of which has been $1.04 per gross ton at the mines. Considering that during the five years there have been a great many market disturbances, this average is surprisingly low. In fact, the highest prices paid by the city during that time are far less than the average private consumer was obliged to pay.

There has been also a great deal said about the inferior quality of city coal based upon chemical analyses made by the Central Testing Laboratory. While the work of this laboratory may not be questioned, the samples are often improperly taken.

There has been no uniform system of sampling, and in many cases this has been carelessly and improperly done. There have been instances of variations of 1,000 B.t.u.'s in two deliveries of coal made to different places, both out of the same shipments. There have also been cases where coal shipped to the city has shown extremely poor results, while a shipment of exactly the same coal to others has been analyzed with favorable results. This probably has been the cause of more dissatisfaction than any one thing.

[It would be interesting to hear from others on this subject.—Editor.]

The Trend of Conditions on New Coal Contracts

SYNOPSIS—Prices on business on the Atlantic Seaboard indicate a general firming up of that market. However, some grades are still being negotiated at minimum prices. In Ohio some big state contracts have been closed at figures substantially less than in previous years. A large Middle Western contract shows a better price than the old figure.

In the coastwise trade the few contracts that have been made the past month show the general firmness of the market, particularly on the Southern coals. While the Panama R.R. contract award (No. 1327, pp. 367, 446 and 532) was mostly at $2.60 f.o.b. Hampton Roads for Pochahontas, it is generally understood why the order was taken at so low a figure, and it is perhaps the exception that proves the rule. The proposals submitted to the Boston & Maine R.R. for locomotive supply (No. 1313, p. 367) were apparently not attractive enough to induce buying, the announcement being made (p. 576) that no further action would be taken for the present. The price paid for coal alongside the "Kronprinz Wilhelm" at Norfolk, Va. (pp. 412, 578), is a straw showing the firmness at Hampton Roads.

The active demand offshore is an important factor in the situation. The departure of the first steamer on regular service to Alexandria, Egypt, notice of which appears in this issue, and inquiries such as those from Liverpool and the Azores (p. 492), Italy (No. 1479, p. 531) and Denmark (p. 532), give some reason for predicting a strong $2.85 price at Hampton Roads, at least for the balance of the calendar year.

For distribution inland the trend is not so pronounced. Recent circulars of Boston agencies announcing a price basis for the year beginning Apr. 1, 1916, are not having a wholesome effect on the current market. Even small contracts like that at Reading, Mass. (No. 1417, p. 489), will probably be closed at as low a contract figure as has prevailed this year. At retail the Auburn, Maine, city supply (p. 532) is a sample indication of the fair prices being realized by most local dealers throughout New England.

Such coal from the Pennsylvania districts as is usually applied to contracts like the Connecticut Co.'s (No. 1420, p. 489) and the Berkshire Co.'s (No. 1427, p. 489) is still realizing minimum prices. An instance is the Massachusetts Training Schools (No. 1224, pp. 245, 578), where the order was placed at prices that net $1.28 f.o.b. mines.

The Crocker-Burbank Coal contract, Fitchburg, Mass., in the current issue, recently awarded to shippers of Georges Creek at full circular prices for delivery via water to Boston against competition of Pocahontas and New River, is further evidence of the market's strength.

Most of the large consumers in New England, their contracts having been very largely placed months ago, are beginning now to press shippers for extra deliveries in order to be protected against any possibility of car or labor shortage later.

In the Philadelphia market the most important contracts under consideration have been the 600-ton order for White Ash buckwheat coal for the Philadelphia County Prison (No. 1409, p. 578) and the deficiency contract for the Bureau of Water (No. 1516, p, 577). On the first contract there is usually very little competition, and it was again awarded to the same company which has supplied the coal for a number of years. The bids on the water bureau contract have not yet been sufficiently tabulated to pass judgment on the results.

Usually at this time of the year many of the anthracite companies begin to look after their contracts with steam-coal consumers, a large number of which expire at the first of the coming year. However, owing to impending disturbances in the mining region it is quite likely that the companies will not enter into new contracts, as this is the precedent on similar occasions. In several instances it is already reported that the operating companies are urging their consumers to stock up at the contract price and in addition are offering to allow the present contracts to run until Mar. 31, 1916.

OHIO

Generally speaking, large consumers in Ohio are able to buy their fuel for the coming year at a cheaper figure than prevailed in 1914-1915. Most of the contracts awarded at this time are for a coal supply beginning about Nov. 1 and continuing for either six months or a full calendar year.

The contract awarded by the Director of Public Safety a few weeks ago for the coal supply for the Scioto River pumping station, the garbage-reduction plant and the municipal light plant (No. 1090, pp. 117, 366, 410) illustrates the cheaper cost of coal. For the six months beginning Nov. 1 the West Virginia mine-run for the pumping station will cost $1.42 per ton, delivered on the switch, as compared with $1.54, the price paid for the same grade of coal in February, 1915, $1.58 per ton paid in the last half of 1914 and $1.72 the first half of last year. The department also paid $1.19 per ton for Hocking nut, pea and slack as compared with $1.20 for the latter part of last year and $1.39½ for coarse slack the first half of 1914. For the garbage-reduction plant the department paid $1.19 for Hocking nut, pea and slack as compared with $1.19½ per ton the first half of 1915, $1.20 the last half of 1914 and $1.39½ for the first half of 1914.

The contract to supply 10,000 tons to the Cleveland State Hospital (No. 1299, pp. 325, 578), providing for Ohio mine-run, delivered on the institution switch at $1.79 per ton, compares with $1.97½ paid last year for the same grade of coal.

MIDDLE WEST

On the water-works contract at St. Louis (pp. 117, 412), involving 34,000 tons of egg and 37,000 tons of screenings, the net price on the lump was 3c. higher than last year and on the egg ½c. lower. The freight rate is also 5½c. higher. The contract for supplying the penitentiary at Jefferson City was let at a price 63c. per ton higher than last year, but this year's contract is on a specification basis, which brings the price slightly below that of last year.

◆

Extracts From a Superintendent's Diary

It takes an occasional trip through a cotton mill or a steel mill to make a mining man realize that the lot of the mine laborer is not so terrible after all.

Because mining villages are generally located on branch lines, 10 miles from nowhere, and moreover because miners are denied much of God's sunlight, our city friends assume that no man would stick to mining after once learning that he could make a living at a city occupation. They have become so accustomed to crowds and the excitement of city life that the isolation of our villages and the stillness within the mines suggest the fate of a Siberian exile to them.

But when our men try their luck in the cities they often find the pace too swift and return at the first opportunity. The accounts that they give of their adventures show that it is not homesickness alone that brings them back.

One of our men who answered the call of the wanderlust by going to a city and accepting work in a cotton mill remarked when he returned that whenever he had attempted to draw a full breath he found himself wedged in between two machines. Another of our citizens who tried his hand as a laborer at a steel plant informed us, when asked about his adventures, that every time he paused to collect his thoughts a rod of hot metal would start after him and chase him out of the building before he could recall what he was supposed to be doing.

Men who have made such journeys into the outside world become, on their return, prominent forces for progress in our community. Not only have they become reconciled to the labor assigned to them by Fate, but they have learned that the new-fangled ideas about sanitation and food inspection have not been introduced into mining camps for the purpose of hampering the poor and lowly and keeping them under control, but are of vital importance.

They have witnessed the workings of similar measures in crowded tenement districts, where everyone accepted them as a matter of course; and now on their return they realize how little attention has been given to such regulations and as a result how much more fatal some diseases prove in spite of the more healthful surroundings of the average mining village.

We have several cases of typhoid in camp now, and today I chanced upon a group of our citizens in conference with our camp physician. In the group was John Taylor, recently returned from a sojourn at a cotton-mill village located on the edge of a large city.

Every suggestion that the doctor made recalled to Taylor's mind some rule and regulation that he had seen enforced, and his comments on what he had seen not only made it possible for the men to understand what the doctor was trying to explain, but gave the doctor new ideas as well.

This discussion of regulations necessary in crowded villages led to a pretty full understanding of the advantages that our citizens really enjoy in comparison with their city brothers—advantages that have always been unappreciated and taken as a matter of course; and as a direct result, our doctor was surprised to find that no suggestion that he felt called upon to make was now considered too radical by his audience.

Later in the day I met him again, and he had become very enthusiastic about the prospects of making our camp a model one from a doctor's standpoint; he is already planning to call the attention of the State Medical Society to the work that he is undertaking.

COMING MEETINGS

National Safety Council will hold its fourth annual safety council at the Bellevue-Stratford Hotel, Philadelphia, Penn., Oct. 19-21, 1915. Secretary, W. H. Cameron, Chicago, Ill.

Engineers Society of Northeastern Pennsylvania will hold a special meeting at its rooms, 415 North Washington Ave., Scranton, Penn., on Thursday, Oct. 28, 1915, at 8 p.m. The object of the meeting is to take corporate action on the proposed issue of $15,000 4-per cent. 10-year bonds, for the purpose of refunding the outstanding floating indebtedness of the society and furnishing money for its general purposes. Secretary, T. F. McKenna.

First Annual State-Wide First-Aid Meet will be held at Bicknell, Ind., Oct. 30, 1915, under the auspices of the local unions of the United Mine Workers of America and the operators of Knox County, the Bureau of Mines and the American Mine Safety Association. Secretary, William Bogle, Bicknell, Ind.

United Mine Workers of America will hold its annual convention in St. Louis, Mo., beginning Jan. 17 and continuing for three weeks. Secretary-treasurer, William Green, 1102-1109 Merchants National Bank Building, Indianapolis, Ind.

American Society of Mechanical Engineers will hold its annual meeting Dec. 7-10, New York City. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

Engineers' Society of Western Pennsylvania holds its monthly meeting third Tuesday of each month; section meeting, first Tuesday. Secretary, Elmer K. Hiles, Oliver Building, Pittsburgh, Penn.

Western Society of Engineers, Chicago, Ill., holds its regular meeting first Wednesday meeting of each month, excepting July and August. Secretary, J. H. Warder, 1785 Monadnock Block, Chicago, Ill.

The Labor Situation

SYNOPSIS—West Virginia as a state opposes the increase in freight rates on coal. The investigators of the Public Utilities Commission declare just what coal freightage in Ohio costs the railroads. The main features of the Rockefeller-King contract. Lawson is admitted to bail.

Resolutions condemning the proposed action of the railroads have been passed by the Chambers of Commerce of Charleston, Fairmont, Clarksburg, Wheeling and Huntington. The United Commercial Travelers at Charleston have passed a resolution condemning the increases. The miners' organizations at various places demand the old rates, and the state Public Service Commission, with its attorney, S. B. Avis, and its railroad representative, E. E. Winters, has visited Washington to protest to the Interstate Commerce Commission. The West Virginia papers have practically all declared the impost of higher freight rates destructive to business, and the West Virginia Coal Association, through its attorney, Z. T. Vinson, its president, T. E. Houston, and its secretary, W. H. Cunningham, is contesting the fairness of the increase.

Most of the arguments suggest that the increased freight will involve a reduction of 15c. per ton on all the coal mined in West Virginia and that the profits would be more than wiped out by such a change in freight. But of course many of the market prices will be automatically raised 15c. per ton by the increased transportation charge, and the action will be more likely to limit the further growth of the West Virginia market than to curtail its present well-extended area.

The West Virginia operators have faith that the railroads will decide not to make the proposed increase. Perhaps the intention is only to bluff off the attempt of the Ohio operators and public in seeking to reduce Ohio rates. But in any event it is felt that no change will be made. One organization has called for $50,000 from its members for a defense fund, but only $20,000 has been actually asked for, and it is likely no more will be paid in unless the fight appears more hopeless than it now seems to be to the contestants.

On Oct. 1 the Railway Commission of West Virginia filed a statement with the Interstate Commerce Commission rejecting a suggestion that it arbitrate the freight rate differentials between West Virginia, Ohio and Pennsylvania bituminous coal fields on so-called lake-cargo coal or coal which goes in solid trainloads from the mines to lake ports for transshipment. The commission declares that it cannot arbitrate and has no authority to make its findings binding upon the coal carriers.

The investigators appointed by the Public Utilities Commission to examine the books of the Hocking Valley Ry. have filed their report. The cost of moving coal is as follows:

Journey from Nelsonville to	Distance, Miles	Cost of Freight, Cents	Mills per Ton-Mile
Toledo	181	46.68	2.579
Fostoria	150	37.71	2.514
Marion	107	31.50	2.944
Delaware	85	25.83	3.039
Columbus	61	20.55	3.369
	584	162.27	2.779

To these figures for freight should be added 1.88c. when the coal is unloaded at the docks and wharves for Lake shipment.

Ohio Miners Start Coöperative Stores

The miners in Ohio are preparing to follow the example of the Illinois mine employees in establishing coöperative stores. This movement is to be praised whenever there seems a prospect of success. Just at present, however, the Ohio miners are suffering from the past dullness and the lengthy strike and are not sure of a busy winter season; so conditions are not favorable for starting stores. Moreover, the merchants having helped to tide the miners over the idle period are entitled to better treatment.

It is quite likely that the refusal of these merchants to bankrupt themselves by giving unlimited credit is the cause of their being penalized at this time by the starting of coöperative stores which will themselves be equally unable to carry their clients through a long period of idleness. Even the bitterness of the experience in coöperative store business is, however, to be welcomed for the miners. Only by having an initiation into the costs and losses of such business will they learn to maintain a charitable outlook toward these small capitalists.

Joseph Kobylak, representing the miners of Rush Run, is discussing this matter with William Roy, vice-president of subdistrict No. 5 of district No. 6, the eastern Ohio field. Stores are already being operated at Adena and Fairpoint and it is proposed that others be opened at Rush Run, Maynard, and Midway. If enough stores can be started to make the establishment of a wholesale house advisable this will be provided by the coöperation of the various local stores.

Colorado Fuel and Iron Co.'s Contract

The contract submitted by the Colorado Fuel and Iron Co. to the representatives of the miners on Oct. 2 and accepted by them subject to a general referendum provided for: 1. The representation of the men at each camp on the basis of one delegate for 150 wage earners. Each camp is to have at least two representatives. 2. The holding of district conferences, joint committees and joint meetings. 3. The prevention and adjustment of industrial disputes. 4. Social and industrial betterment.

For purposes of mediation the company's camps are to be divided into five districts—the Trinidad, the Walsenburg, the Cañon, the Western and the Sunrise, Wyo., districts. The Cañon district comprises all the mines in Fremont County. The Western district includes all the operations on the Western Slope in Colorado.

The delegates of the miners and the company at each district conference will select from their number joint committees, each composed of six members. These committees will be as follows: One on industrial coöperation and conciliation, one on safety and accidents, one on sanitation, health and housing, and one on recreation and education.

The company pledges itself to observe all federal and state mining laws and not to discriminate against any of its employees on account of membership or nonmembership in any society, fraternity or union. The right to hire and discharge, the management of the properties and the direction of the working forces are vested exclusively in the company and are not to be abridged by anything contained in the agreement.

Under the plan the company will post a list of offenses for which dismissal may be made without notice. Employees may not be dismissed for other offenses except after notification that a repetition will result in dismissal, but the company still reserves the right to relieve employees from duty for lack of work. Employees are guaranteed the right to hold meetings, to purchase supplies where they please and to employ checkweighmen.

How Miners' Grievances Are To Be Settled

Any miner or group of miners aggrieved at any working condition must take the matter to the elected representative of the camp. He is to try and reach an agreement with the foreman or superintendent. Failing that, he is at liberty to appeal to the president's industrial representative, who is at present David Griffiths, or to the higher officers of the company, finally reaching the president, J. F. Welborn.

But another method of settlement is provided. The miner or miners may have a hearing before the district joint committee on conciliation. This committee may either hear the case or appoint an umpire, whose decision shall be binding on both parties. If the committee fails to reach an agreement, it shall be settled by arbitration or by reference to the Colorado State Industrial Commission.

The company provides that the representatives of the men shall not be discharged unjustly or discriminated against in the apportionment of cars or work, and any representative who believes he has a grievance may appeal to the State Industrial Commission. The agreement is to remain in force till Jan. 1, 1918, and shall continue in force thereafter subject to revision should either party give 90 days' notice that such revision is desired.

Provisions Relating to Living Conditions

The employees are guaranteed that the charges for dwellings without bath shall not exceed $2 per room per month. The present uniform charge of 40c. per electric light per month with free light on porches shall not be increased. There shall be no charge for domestic water except where the company is obliged to purchase it. In such cases the rate chargeable shall be substantially the same as the cost to the company.

To encourage employees to cultivate flowers and vegetable gardens the company agrees to fence, free of charge, all its house lots. It will continue its practice of removing garbage free of charge. As the need becomes manifest it will continue its present policy of providing, as rapidly as possible, suitable bathhouses and social centers in the nature of clubhouses for the employees at the several mining camps.

Eight hours will constitute a day's work for all underground employees. This will mean eight hours exclusive of the noon hour and the time required to go and come from the mine opening to the place of employment. Nine hours will constitute a day's work for all outside labor, except that of firemen and engineers.

All employees will be paid semimonthly by check. No deductions will be made from earnings, except where authorized by employees. No change affecting conditions of employment with respect to wages or hours will be made without giving 30 days' notice, as is provided by statute.

The schedule of wages and the working conditions now in force in the several districts will continue without reduction; but if, prior to Jan. 1, 1918, a general increase is granted in competitive districts in which the company does not conduct operations, a proportional increase will be made. For this purpose a joint meeting of the miners' representatives and proper officers of the company will be called, within 30 days after the increase in competitive districts is effective, to discuss and determine a method for fixing the schedule in the new districts affected.

⁂

Outlook in Coal Mining

In our last issue we printed nearly two pages of comments from prominent coal-mining people relative to the prospects for business in the coal industry this fall and winter. Additional opinions are coming in every day, the following being only a few of those received:

ALABAMA

B. F. Roden, Pres., Roden Coal Co., Marvel	Fairly good. Prices still low, and as bulk of contract business does not expire until next year, the average price for coal will be low this winter.
W. R. Young, Hills Creek Min. Co., West Blockton	Fair. Domestic business good. Steam business dull.
James Gallacher, V. P. & Gen. Mgr., Summit Coal Co., Dora	Good. This is new company just organized to develop 1,000 acres on Black Creek seam.

CANADA

John S. Barton, Minudie Coal Co., Ltd., River Herbert, N. S.	Very brisk. There is great scarcity of labor.

COLORADO

G. W. Harris, Pres., Colorado & Utah Coal Co., Denver	Good in the Routt County field.
Juanita C. & C. Co., Bowie	Poor.
J. J. Wolfersperger, M. S., Yampa Valley Coal Co., Pallas	Good.

ILLINOIS

Carl Scholz, Pres., Rock Island Coal Min. Co., Chicago	Average business this fall and winter. If strike occurs in competitive fields business will be rushing.
West End Coal Co., Springfield	Fairly good.
W. C. Alexander, Pres., The Carterville Herrin Coal Co., Herrin	About normal.
Egyptian Coal & Min. Co., Marissa	Fair.
W. R. Coleman, Clark C. & C. Co., Peoria	Above the average.
Bell & Zoller Coal Co., Chicago	Very good.
F. S. Pfahler, Gen. Supt., Southern Coal, Coke & Min. Co., Belleville	Better than last year.
Bessemer Coal & Min. Co., Tilden	Better.
Carterville & Big Muddy Coal Co., Carterville	Good. Many of the large mines which have been idle in Williamson County are now working full time.
James A. Hall, Trustee, Cantrall Co-Operative Coal Co., Springfield	Good.

INDIANA

A. M. Ogle, Pres., Vandalia Coal Co., Terre Haute	Materially improved.
John H. Jones, Klondike Coal Co., Oakland City	Good.

IOWA

A. B. Dudley, Treas., Egypt Coal Co., Mystic	Fair. Prices weak account too much eastern (Ill.-Ky.) coal being dumped on this market.
Phoenix Coal Co., Mystic	Fair. Enough business but prices low. Too much eastern coal.
S. P. Maring, Pres., Iowa Block Coal Co., Exline	Good.
T. E. Lee, Pres., Peerless Coal Co., Mystic	Normal.
K. G. Carney, Gen. Mgr., Wright Coal Co., Carney	Good.

KENTUCKY

Thomas S. Hayman, Gen. Mgr., Elk Horn Min. Corp., Fleming	Fine.
Frank L. Long, M. S., The Royal Collieries Co., Offutt	Good.
J. W. Cockill, Gen. Mgr., Henry Clay C. & C. Co., Lookout	Extra good. Labor and car shortage. All mines arranging to increase output.
R. F. Coke, G. M. Min. Div., Elk Horn Min. Corp., Fleming	Running full time.
Himyar Coal Corp., Domino	Good.
Magnet Coal Co., Four Mile	Good. Car shortage at present.
Banner Fork Coal Co., Wallins Creek	Fair.
W. L. Moss, Moss & Sons Coal Co., Pineville	Fairly good.
David Halley, The Purity Cannel Coal Co., Prestonburg	Good.
R. L. Wheeler, Brush Creek Min. & Mfg. Co., Wheeler	Good.
T. B. Mahan, Mahan-Jellico Coal Co., Packard	Good.
E. W. Holt, The Holt Coal Co., Central City	Normal. Car shortage.

MISSOURI

W. L. Schmick, Gen. Mgr., Big Muddy C. & I. Co., St. Louis	Fair on domestic coal but poor on industrial coal.

MONTANA

Walter Scott, Star Coal Co., Musselshell	Above average.

NEW MEXICO

Thomas H. O'Brien, Gen. Mgr., Stag Canon Fuel Co., Dawson	Fair.
P. A. Allaire, Emerson & Allaire, San Antonio	Good.

NORTH DAKOTA

J. W. Dering, Mgr. Min. Dept., National Briquetting Co., Kenmare	Exceptionally good.

OHIO

The Meister Coal Co., Flushing	Moderate.
W. F. Upson, Pres., Upson Coal & Min. Co., Dixie	Good.
F. W. Braggins, Lorain Coal & Dock Co., Columbus	Much better.
Thomas Brettell, Jr., Gen. Mgr., Brettell Bros., Mingo Junction	Good.

OKLAHOMA

J. G. Puterbaugh, Pres., McAlester Fuel Co., McAlester	About 70 to 75 per cent. of last year.
Wm. A. Evans, Gen. Supt., Rock Island Coal Min. Co., Hartshorne	Good.
Carbon Coal Co., Carbon	Business will depend upon weather. Cold winter, good business.
Okmulgee Coal Co., Okmulgee	Normal. Good outlook.

PENNSYLVANIA

W. W. Helman, Blain Run Coal Co., Coalport	Much better.
Hebron Robison, Gen. Mgr., West Virginia-Pittsburgh Coal Co., Pittsburgh	Continuous improvement.
W. G. Rogers, Gen. Mgr., Fair View Min. Co., Pittsburgh	Very good. August tonnage greater than June and July combined. September better than August. Good outlook.
J. P. Corcoran, Traders Coal Co., Ridgewood	Brick.
Ellsworth Coal Min. Co., Minersville	Good.

TEXAS

R. W. Carr, Carr Coal Co., San Antonio	Dull.
J. H. McLure, Gen. Mgr., Strawn Coal Co., Strawn	Good.
Geo. Derby, Gen. Mgr., Santo Tomas Coal Co., Laredo	Good.
Bridgeport Coal Co., Bridgeport	Ordinary. We have fuel oil as competitor.

UTAH

Central C. & C. Co., Salt Lake City	Good.
J. S. Smith, Sales Mgr. Spring Canyon Coal Co., Salt Lake City	Good.

VIRGINIA

C. H. Thompson, Gen. Mgr., Darby Coal Min. Co., Darbyville	Above normal.
J. S. Cheyney, Stonega Colliery Co., Glamorgan	Better this fall.
Everett Drennan, V. P. and Gen. Mgr., Stonega Coake & Coal Co., Big Stone Gap	Better than any time this year. All mines working full time. Stimulus due to big demand for coke. Steam and domestic coals quiet.

WASHINGTON

Pacific Coast Coal Co., Seattle	About same as last year.
B. H. Johnston, Pres., Mendota C. & C. Co., Centralia	Same as last year.

WEST VIRGINIA

A. J. King, Sunbeam Coal Co., Charleston	Good.
W. N. Page, Pres., Gauley Mountain Coal Co., Ansted	Coal markets and prices unsatisfactory Coke in good demand and prices improving.
Vulcan Coal Co., Vulcan	Good.
Ben Franklin Coal Co., Mountsville	Good.
Black Betsey Coal Min. Co., Black Betsey	Much better.
Carbon Coal Co., Carbon	Good demand for all grades. Labor shortage.

WYOMING

Cambria Fuel Co., Cambria	Fair.
Frank A. Manley, V. P. and Gen. Mgr., Union Pacific Coal Co., Rock Springs	Good all over the West.
The Owl Creek Coal Co., Gebo	Business very good.
Peter Kooi, Kooi	Better than usual.

Editorials

Coal--Civilization--War

That the actual civilization of today and the continuance of the present war are both dependent to a large extent on the output and use of coal is a fact not generally known or realized and may appear to be an anomaly or an exaggeration. Yet it is neither—no anomaly because it is the result of systematic study and experiment, a form of true evolution; no exaggeration when we take into consideration the vast number of processes using coal or dependent on its products.

Nor is the money value of the coal we produce, to say nothing of its byproducts, a matter of general knowledge. Take the value of raw coal at the mines as it is loaded upon cars. In 1913, for the United States alone, this amounted to $760,488,758. Its potential value is much greater, probably at least twice as much.

When we consider the vast proportion of our coal business, the ignorance of the average man regarding its conditions, activities and nature is astounding. Talk to people, ask them what coal is composed of, how it is mined, what products we obtain from it, the answers to such questions will prove the foregoing statement to be true. Even the daily papers, that could easily obtain accurate data, show a misunderstanding and lack of knowledge on the subject that are both ludicrous and lamentable.

As to the need, the absolute necessity of coal to a continuance of the war now going on, the words of that famous Britisher, David Lloyd George, in a speech made last week at a national conference of coal operators and miners, make a plain and startling summary:

"Coal means life for us and death for our foes. Steam means coal; rifles mean coal; shells are filled with coal—the very explosive inside of them is coal, and coal carries them right on to the battlefield to help our men. Coal is everything to us, and we want more of it to win the victory. Our navy owes its strength to coal. We must have more coal to win."

Even to fight at all, under modern warfare conditions, coal is absolutely necessary.

If all the coal mines in the countries at war were closed, all fuel stocks exhausted (as they very soon would be if the mines did not operate) and no coal could be obtained from neutral countries, the war on land would automatically end, unless the combatants returned to swords, knives, bayonets and clubs. Battleships, cruisers and submarines would be badly crippled, as it would be impossible to get sufficient oil to take the place of coal.

Coal is the prime mover of our civilization; and whether for peace or war, it is the substance that gives to us more useful things, more things vital to our existence, than any other substance. It is the one necessity about which we know so much and yet so little. Formed when there was no sign or footstep of man, its real value has only been discovered in the last few years. Without it our boasted civilization would be as of the Stone Age.

Many people believe that coal furnishes us only light, heat and power, whereas it is from coal that we obtain beautiful dyes, delicate flavors, the fragrance of flowers, the most powerful drugs, the material for modern explosives, antiseptics and disinfectants, roofing material, road, pavement and building materials, oils of various kinds, fertilizers, besides many other substances of great commercial value.

The following verse, published in *Punch,* covers the situation exactly:

> "There's hardly a thing that man can name
> Of use or beauty in life's small game
> But you can extract in alembic or jar
> From the 'physical basis' of black coal tar;
> Oil and ointment and wax and wine
> And the lovely colors called aniline;
> You can make anything, from a salve to a star,
> If you only know how, from black coal tar."

⁂

Rockefeller in Colorado

The visit of John D. Rockefeller, Jr., to Colorado has had all the good effects prophesied by W. L. Mackenzie King, who, speaking of the future possibilities of a satisfactory settlement, said: "The will and conscience of John D. Rockefeller is more powerful in Colorado at present than any force which could be brought to better conditions." F. P. Walsh's criticism of that forecast now appears only weak and stupid, but men of his cast of mind are not seriously troubled even when they are shown to be ridiculous.

Mr. Rockefeller has vindicated himself and has done a considerable service to democracy by his genial proof that a rich man is in no way different from other men and is capable of enjoying the same pleasures. The wonder is that the public should have found it necessary to doubt it and growled so unpleasantly because for so long he did not take the tiresome journey and long time which were necessary to prove it.

But his trip is in a sense discouraging. Where is our democracy, if the public and some employees are to seethe with discontent and then to be brought back to friendliness by being cozened with a little easy familiarity? Are the slap on the back and a handshake really so potent that they become more effectual than liberality and character? No wonder the labor agitator, who also can dance with the miners' wives and grasp the hardened and begrimed hand of the toiler, has such power.

Surely the long attempts of the Colorado Fuel and Iron Co. to build good homes, maintain a fine hospital, provide excellent schools and secure safety for its employees should not have been overlooked by the public. Surely the work of the Rockefeller Foundation to supply a livelihood for the persons who had vituperated Rockefeller and all his officials should not have been forgotten. But still more surely these excellent qualities of Rockefeller's company and institution should not have been covered with oblivion only to have the trick of acquiring the good-will of the employees and the public turned by such trifling acts as the visit of that millionaire and a few meals eaten in common. But it is no new thing to see the public stampeded one way or the other by its personal interest in an individual. The people like to erect certain visible impersonations of times and conditions and seek some man to use as a type just as they sculpture a figure of justice and set it symbolically on a court house as a source of inspiration.

It is grossly undemocratic for the public to be so easily appeased by the mere presence of a rich man and yet to be so undemonstrative and even so hostile when that rich man and his associates have proved themselves for so many years the disinterested friends of the miner. We shall only be democrats when we judge a man by his acts and not by his manner. It is to be regretted that Rockefeller was not understood and appreciated till he used those arts which a politician learns and practices with only one-tenth part of the sincerity with which Rockefeller is animated.

But mine managers may well learn a lesson. Justice is excellent, but the quality of being human—humanity—is even better. We cannot get along without the personal element in management. Absenteeism is largely the absence of the human touch and nothing more. It may be apparent even when the management is physically present though spiritually removed. In cities where employer and employee live within a few squares of each other, absenteeism is as glaringly apparent as ever it was in the Colorado camps.

Democracy too often does not reason from analogy. It too frequently depicts individuals who are at a distance as if they were something other than human. But the coal miner must not be blamed for not understanding a millionaire whose father made his money in oil, for others than he show an equal inability to exercise a saving imagination.

Only today there came into the office of *Coal Age* a man whose business for many years has been advertising. He wanted to know who was the author of the "Notes from a Superintendent's Diary," which has been running in these columns and has met with so many favorable comments. "I am sure," said this visitor, "that scholarly fellow never superintended a mine; he has such a broad and human view." Was there ever a more laughable statement?

He was assured that the author of that diary had been a superintendent for several years and even now found in the mines his source of income. And if a man who has graduated from college, has seen something of the world and has had a wide range of reading has evolved from his consciousness such a conception—let it not be termed puerile for fear he may read this editorial—what may be, what even must be expected from men who without his advantages have been taught year after year to believe that Rockefeller is a barrel of oil with a battle-ax in one hand and a club in the other and cursed with a face lean with avariciousness?

Of course not by any means is it true that all the present employees who voted for Rockefeller's new plan were lukewarm or opposed to him through the long period of strife which marked the Colorado strike. In fact, most of the men who continued working during the strike—not, of course, those who have been reëmployed since its conclusion—must have been markedly loyal to stand by the company through the murder and arson which the strikers visited so liberally on the faithful. Still, that many of them were won over is suggested by the queer freaks in voting. Rockefeller danced and met his employees in closest union at Cameron. Here 128 voted in favor of the plan and none against. But in Rockvale, Fremont County, where Rockefeller did not go and where therefore he is still an absentee, the vote was 81 in favor of the plan and 156 in opposition to it. The whole vote stands 2,253 ayes and 483 noes.

It is interesting to note that in the mines around Ludlow the voting was most consistently for the Rockefeller-King plan. Either the men there know the facts of that trouble or else the presence of Rockefeller has done much to remove the animus created by the unfortunate event which happened in that unlucky spot.

It is apparent that larger than measures stands the man; stronger often than right doing is the "glad-hand." It would be indeed well if the anthracite operators could only learn that fact. It would help them to receive justice in their relations with the public and in their dealings with their employees, and they would not have the difficulty they now experience in securing amicable adjustments of their coal prices and wages. So far the operators have not recognized their place as industrial leaders or they would not have found their rightful supremacy menaced by those who not only term themselves, but actually are, the leaders of labor.

⁂

The Need for Stern Measures

In one of Gilbert's farces we are gravely assured that the burglar when he isn't burgling is dangling his children on his knee. And Gilbert was probably correct in his appraisal of burglar morals. But despite the virtues of burglars and other bad bold men we cannot afford to let them go free to terrorize society nor can we because of the good that is undoubtedly in them overlook the evil which is equally undoubted.

One questions whether it is well to let bygones be bygones and let the Colorado strikers who burned, shot and terrorized men and women go scot free. If the past were past and past forever we might feel satisfied with such a solution, but what guarantee is there that the offenses, now to be forgiven and forgotten, will not be repeated by these or other men? This last labor struggle is not the only instance in the selfsame state of Colorado.

In Arizona, a state which corners with Colorado and has a governor more criminally lenient than even Governor Ammons ever was, six mine officials have been taken prisoners by the strikers and their sympathizers. A sheriff's posse rescued them and put them in Clifton court house for safety. The strikers, 2,000 in number, have raided the ice and electric plants, taking out nonunion men. Their cry is, "Down with the mine manager! Hurrah for Governor Hunt!"

The law has been treated as a weapon to be used or laid aside at the will of governors and prison authorities at the bidding of politics or maudlin sentiment. It has now lost all its strength—no, not all. It still restrains sidewalk expectoration, delayed reporting of tax returns, smoking in forbidden places and other like peccadillos. For crime it has lost much of its value, especially when those who are guilty of it have a long line of noisy and well-distributed supporters to make a lusty protest

Colorado-New Mexico Meet

By Edgar Sherman*

That first-aid work has advanced in the Colorado and New Mexico coal fields was well demonstrated by the eight teams competing for first honors in the Colorado-New Mexico meet which featured Miners' Day at the Trinidad-Las Animas County Fair, Sept. 23.

The maximum score possible was 400 points for the four events, and no team in the competition was penalized as many as 50 points for careless work or failure to apply the proper treatment. Oakview No. 2, of the Oakdale Coal Co., was awarded the cup with a total score of 384, while the Walsen team of the Colorado Fuel and Iron Co. took second place with a total of only 2 points less.

BOY SCOUTS AS RAILBIRDS AT MEET, SHOWING THEIR INTEREST IN PROCEEDINGS

The teams competing and their final scores were as follows: Oakview No. 2, 384; Walsen, 382; Piedmont, 378; Morley, 373; Grey Creek, 373; Delagua, 371; Ravenwood, 370; Oakview No. 1, 354.

The events were as follows:

One-Man Event—A man has his left foot and ankle crushed by a loaded car and as a result has a severe shock. A large blood vessel on the front of the foot is wounded and bleeds freely. Dress and carry 50 ft. without stretcher.

Full-Team Event—A rock falls on a man, causing a compound fracture of the right thigh at the middle third, a simple fracture of both bones of the left forearm and a compound fracture of the left side of the lower jaw. Dress and carry 100 ft. on a stretcher.

Two-Man Event—A man is rolled by a car, and the fourth, fifth, sixth and seventh ribs on his right side are fractured. He is found with blood flowing from his mouth and suffering from a severe shock. Dress and carry 50 ft.

Full-Team Event—A man has received in a gas explosion second-degree burns on face, scalp, hands and forearms. Dress and carry 100 ft.

The judges in the contest were: Lieutenant J. R. Hall, of the United States Medical Corps of Fort Logan, Colo., Captain H. G. Garwood, Dr. J. W. Ameese, Dr. E. O. Coleman and Dr. R. M. Shea. All the four last-mentioned are of Denver.

While the first-aid meet was the primary feature of Miners' Day there were other contests arranged for the visiting miners and their families, and both the Boy Scouts and Camp Fire Girls of the various camps participated in the celebration.

⁂

Institute Mining Schools

SYNOPSIS—The anthracite miners are attending night school in great numbers, and classes for women and girls are being held at Nanticoke, Penn.

The reports of those mining institutes in the anthracite region that are conducting mining schools at night under the direct control of the local public-school boards have just been completed by their respective presidents and secretaries and have been compiled and arranged in a comprehensive report by Charles K. Gloman, chief clerk of the Susquehanna Coal Co., Wilkes-Barre, Penn. This pamphlet is published by those companies that have taken a special interest in this work.

INSTITUTE, SCHOOL, STATE AND COMPANY COMBINE

This is the fifth report since the movement started, though the organizations were for some years in no way aided by the school district or the state. In fact this is the second season during which the schools have been directly controlled by the public-school boards and have enjoyed the immediate coöperation of the State Department of Public Instruction. At the same time the operating coal companies have not made

OAKVIEW NO. 2, WINNERS OF FIRST PRIZE

All Welshmen and proud of it. From left to right: Alec MacBurnie, captain; Eharlyn Richards, D. G. Roberts, A. H. Powell, P. Daley, A. G. Sugg. Seated: W. L. Morgan, superintendent, with cup captured from Walsen team

WALSEN TEAM, WHICH TOOK SECOND PRIZE

This team had won first prize in three previous meets and held cup two years against all comers. From left to right, standing: Robert Bausfield, Joe Wood, B. S. Marble; kneeling: Joe Polaski, Jim Cruso and Lawrence Cruso the assistance rendered by the commonwealth a reason for withdrawing their help but have continued to extend their moral and financial support. The wisdom of this threefold method of control has been amply proved by the results. With advisory committees representing both the employers and employees coöperating with the public-school authorities the three elements are united and assure the present and future success of the schools.

---

*Cokedale, Colo.

The needs of the employee and those of the employer are thus combined with the knowledge and experience of the educational experts. The best proof of the success of this combination is that this year 11 of the students passed the state examinations for mine foremen and 44 those for assistant mine foremen. The total number of those studying has also increased greatly.

There were over 2,500 students enrolled in the schools of the Nanticoke Mining Institute, the Shamokin and Mt. Carmel Mining Institute and the Williams Valley Mining Institute in the season which ended this spring, and the aggregate membership of these institutes was 2,296. The following table shows the remarkable growth of the first two institutes and their schools since they were founded in 1910:

Institute Year	Nanticoke Mining Institute		Shamokin and Mt. Carmel Mining Institute	
	Members	Students	Members	Students
1910-11........	500	100	108	25
1911-12........	501	128	254	56
1912-13........	679	637	571	763
1913-14........	821	841	761	1,016
1914-15........	928	1,269	1,073	1,052

In addition to this the Williams Valley Institute, which has just completed its second year, had 295 members and 242 students.

INSTRUCTION ALSO FOR WOMEN IN THEIR WORK

Men are not the only pupils, nor is mining the only study taught. During five months of the last season Mrs. Anna Snyder Lape was employed by the Nanticoke Mining Institute as field secretary for the sewing classes for married women and employed girls. The last month of her time was devoted to a canvass of the houses in the community, and she secured no less than 559 applications from women to attend the night classes in sewing, cooking and English this fall.

These schools conducted by the mining institutes under the direction and authority of the local school boards aided by the State Department of Public Instruction have the hearty coöperation and support of the coal companies whose employees attend them. In the Nanticoke District, the Susquehanna Coal Co., the Delaware, Lackawanna & Western R.R. Co., the Lehigh & Wilkes-Barre Coal Co. and the Alden Coal Co. are their supporters. In the Shamokin and Mt. Carmel District the companies interested are the Susquehanna Coal Co. and the Philadelphia & Reading Coal and Iron Co. The majority of the students at the Williams Valley Institute schools are employees of the Susquehanna Coal Co.

LOWER COAL FIELD HAS ALSO BUSY SCHOOLROOMS

Similar night schools have been conducted in the boroughs of Plymouth and Shickshinny, but only under the auspices of the local school board. The Panther Valley Mining Institute had a paid-up membership of 770 last year, and held six monthly meetings. The work was divided into districts and these vied with one another in presenting papers. These papers and the discussions arising from them were of much assistance to the membership.

In connection with the institute, night schools were conducted by employees from the engineering department, under the direction of the superintendent of schools, who is also one of the Lehigh Coal and Navigation Co.'s superintendents. The school had a membership of 139 and an average attendance of 81. Two sessions were held weekly, and mining, primary, electrical, English and mechanical subjects were taught by 10 instructors.

This gave an average of one teacher to eight scholars, which is larger than is customary. In a number of instances students have been promoted especially where the graduates have passed their examinations and been certificated as mine foremen. The students have a slight charge to meet for books. The average expense is $2 per pupil.

⁂

San Francisco Meet of National Safety Council

On Sept. 23 and 24, the Third Annual Joint Field Meet of the American Mine Safety Association and the United States Bureau of Mines was held in San Francisco at the International Panama-Pacific Exposition. This year the California Metal Producers' Association coöperated in promoting the meet and in making it a success. A further interesting fact in relation to the management of the contest is the fact that at the last moment the National Safety Council took the place of the American Mine Safety Association which has now been disbanded.

The first prize for mine-rescue work was awarded to the Sunnyside No. 2 team of the Utah Fuel Co., which was recently portrayed in the columns of *Coal Age*. The first-aid contest was won by a metal-mining team—that of the Homestake Mining Co., of Lead, S. D.—which scored 99 points out of a possible 100.

The first-aid contest was particularly keen, there being 9 teams representing 13 states. The Nevada Consolidated Copper Co., of Magill, Nev., was second, with a rating of 98.6 points. The team of the Bunsen Coal Co., of Westville, Ill., took third place, receiving 96 points.

The teams were awarded their prizes with appropriate ceremony in Festival Hall. H. M. Wilson, formerly secretary-treasurer of the Mine Safety Association and former engineer in charge of the Bureau of Mines at Pittsburgh, Penn., presented the Homestake team with cups and medals. The Utah Fuel Co. rescue crew was presented with its award by L. R. Palmer.

The Utah Fuel Co. rescue crew consists of M. H. Detweiler, captain; Zeph Thomas, T. J. Johnson, George Clark, J. W. Littlejohn and George Usher. The Homestake Mining Co. first-aid team is composed of C. L. Ayres, captain; James Letcher, A. E. Aladalo, M. Ellis, B. Hardwick, J. Peters, William Yaeger and F. E. Clough, manager.

⁂

Sociological Notes

The Annual Sociological Conference of the Colorado Fuel and Iron Co. camps was held in Trinidad, Colo., on Oct. 15 and 16. Many leading educators of Colorado were in attendance. A morning session was held at Sopris, Colo., where the school and community houses were inspected.

The Fourth Annual Mine Safety Demonstration of the Ellsworth Collieries Co. was held at Ellsworth on Oct. 12. School inspection, folk dancing, lunch provided by the domestic science class, band concerts, first-aid and mine-safety demonstrations were the leading events. Mine No. 1 at Ellsworth, Penn., was winner with 1457 points, mine No. 2 receiving 1,404 and No. 3, at Cokeburg, Penn., 1,408.

The Philadelphia & Reading Coal and Iron Co. has published its official record of the Lakeside meet. It shows that Brookside received 99, Pine Knot, 98; Wadesville, 97; Suffolk, inside, 96; Draper, outside, 95; West Shenandoah, outside, 91; Alaska, 90; Mahanoy City, inside, 89; North Franklin, 87, and Bast, outside, 85.

The West Virginia-Pittsburgh Coal Co. entertained its employees in the company hall at Colliers, W. Va., recently. Music was rendered by the Locust Grove Band, and refreshments were served to all present. Prizes were awarded by G. A. Wright to those who had the best gardens. Fred Rocchio received the first prize of $25, Dominic Crossio received the second, $15, and Louise Corrodo the third, $10. The fourth prize of $10 went to Marconi and Gobbi, and $5 each was awarded to P. Bonazzi, J. Rometti and J. Tobler. W. S. Owings and G. A. Wright, retired farmers, were the judges, the former presiding over the meeting.

Night Schools for Miners have been started, in some cases by operators, in others by the Young Men's Christian Association or the local public-school boards at Nanticoke, Glen Lyon, Wanamie, Alden, Mt. Carmel, West Coal, East Coal, Brady, Sagan, Kulpont, Exchange, Shickshinny, Nesquehoning, Plymouth, Wiconisco, Lykens, Shamokin, Ellsworth, Centralia, Lost Creek, Mahanoy City, Shenandoah, Minersville, Pottsville, Hazleton, Wilkes-Barre and Scranton, all in the State of Pennsylvania. In all these the operators take an active interest. In some cases the whole cost is provided by the operators but in other instances only a part is thus furnished.

Discussion by Readers

Efficient Mine Foremen

Letter No. 7—I have read with avidity the discussion of "Efficient Mine Foremen," and would like to give a picture that some may consider more or less ideal, but is nevertheless my conception of what constitutes an efficient mine foreman.

First, as to his character: He must have the right personality; he must be a humanitarian and not a misanthrope. His love of humanity will teach him that all men are fundamentally equal and as a result he will treat them with due respect and courtesy. His integrity is above reproach, making him immune to the many petty and larger briberies that come to the mine foreman by virtue of his official capacity. He is just, treating all his workmen with strict impartiality. His standing in the community is that of a man of honor and of clean and sober habits. While he may be strong-minded and have positive views, he is not bull-headed, but open to suggestions, whether these come from the general manager or from a modest trapper boy. His wise administration will gain for him both the high appreciation of those who are his superiors in office and the absolute confidence and respect of his men.

Second, as to his capability and fitness for the office he holds: He is thorough and uptodate, theoretically and practically—a careful student and close observer of every detail. The safety-first idea is not, to him, an abstract notion with which he is expected to keep pace; instead, to him it is an important fact that vitally affects all who work in and around the mine. His constant endeavor is to teach men to be watchful as a means of avoiding possible accidents. When these occur, however, he is prepared to care for the injured and render every possible aid.

Third, as to his knowledge and experience in mining: He is thoroughly acquainted both with the mine in his charge and the system of mining employed. His knowledge of conditions throughout the mine enables him to get the best results in the ventilation of the workings and the timbering and drainage of the mine. He is a firm believer in good haulage roads as being essential to maintaining a uniformly large output of coal. He insists on the humane treatment of the mine mules. Every class of mine machinery and equipment receives his careful attention, realizing, as he does, that a regular daily tonnage depends on its constant operation. He is a strong economist, guided and controlled by a practical judgment. All reclaimed material is stored at a central point in the mine, from which it is distributed as occasion demands. This supply is exhausted before he will permit new material to be ordered or sent into the mine. He studies carefully trade-union agreements, knowing that a superficial knowledge or an inaccurate interpretation of their meaning is the cause of a majority of organized-labor troubles. The knowledge so required enables him to deal justly with his men and expect from them a fair return.

Fourth, as to the results of his management: The number of accidents occurring in the mine is reduced to a minimum, because the men coöperate with such a foreman in his safety-first campaign. They come to realize that their physical well-being is of more value to them than any award under compensation laws or relief plans. The quality of the coal mined is improved, because he has made the men to understand that the marketing of the coal and the continuous operation of the mine depend on their sending good, clean coal to the surface and that in doing this they avoid the danger of being fined, docked or discharged. The result is a maximum output of coal at a minimum cost of production. The efficiency of the foreman and the coöperation of the men produce these much-to-be-desired results. There is thus established a feeling of mutual confidence between the foreman and his men, and as an outgrowth of this condition in the mine, there is formed a closer affiliation through the agency of social clubs, educational classes, entertainments and sports, all of which enable foreman and men to meet on a fraternal basis as citizens and coworkers in a prosperous and contented community.

With this picture before us, I would ask, Does efficiency pay?

WM. JARDINE,

Explosibility of Coal Dust

Letter No. 2—The following remarks that appeared in the editorial in *Coal Age*, Aug. 21, p. 303, entitled "Explosibility of Coal Dust," appeal to me as worthy of careful analysis on the part of all investigators of the dust-explosion problem:

> Until more is known and until the value of the tests of inflammation as a true index of explosibility is proved, it is best perhaps to sit on the fence and declare that we do not know why one dust explodes with ease and violence and another dust with difficulty and without energy.

It is obvious to all that the uncertainty to which this remark refers must be removed if possible, because the complete understanding of why one dust explodes with ease and violence while another is difficult of explosion and develops little or no energy is a fundamental necessity in the solution of the explosion problem and the adoption of means for protection against such an occurrence.

In our investigations, thus far, we have learned that the magnitude of explosive power of a combustible gas depends upon the amount of air with which it is mixed. Different gases require different proportions of air to develop the maximum explosive energy. We have learned that, likewise, the complete combustion of different kinds of coal involves a different weight of air for the same weight of coal consumed, and even when burning different grades of the same coal it is necessary to regulate the air supply to suit the requirements of each grade in order to get the best results.

It is logical, therefore, to conclude that every variety of combustible dust requires its own specific admixture of air in order to develop its maximum explosive force. This fact alone explains why one dust is easily exploded and develops great violence, while another explodes with difficulty and little energy. It is important to distinguish, in this connection, between the inflammation and the explosion of gases, in order to appreciate fully the influence of air supply. While the inflammation of a gas may take place under a variety of conditions or mixtures, perfect combustion resulting in a maximum of explosive energy only obtains with an exact proportionment of air and gas. The editorial states further as follows:

> All we do know is that it is almost impossible to explode under working conditions a mineralized carbon dust like anthracite.

This knowledge is comforting, but undoubtedly there would be a feeling of greater security if the true reason were known why the explosive combustion of anthracite dust is impossible under the conditions prevailing in the mines. While the test made on anthracite dust in the experimental mine at Bruceton developed no explosion, similar experiments made in England on anthracite dust from the mines in Wales produced explosive combustion of the dust. The suggestion that the anthracite dust of Wales contained a slightly greater volatile content than the dust of Pennsylvania anthracite is merely a guess in the attempt to explain the difference in the results of these experiments.

The English experiments were not made under the same conditions as those in the United States, which renders it impossible to form an accurate conclusion without knowing the influence of these differing conditions. It would have been interesting if the two governments had exchanged dust and had performed experiments, each under their own conditions, on the other's dust. This exchange would have served to render the experiments comparable. Had the Welsh dust then exploded in the Bruceton mine, and the dust from this country failed to explode under the English conditions of experiment, we might rightly conclude that the difference was owing to the greater volatile content of the dust.

On the other hand, if our experimenters should fail to produce explosion of the Welsh dust, while the dust from this country exploded in the English mine, it would be conclusive proof that the difference in the results of the experiments was not due to the constitution of the dust of the coal, but to the difference in the conditions under which the experiments were performed. Further tests would then be necessary in order to reveal the true reason for explosive combustion.

I feel that little has been done at any of the experimental stations to establish the exact influence of the air factor in dust explosions in mines. On June 11, 1914, a test was made in the Bruceton mine, on the occasion of the visit of the Mine Inspectors' Institute, U. S. A., to that mine. A description of this experiment will be found in *Coal Age,* Vol. 6, p. 65. This description was prepared by Chief Engineer Rice and Assistant Engineer Jones, of the Bureau of Mines, who state that the air current traveling in the mine just prior to and at the moment of explosion had a velocity of 850 ft. per min. In this experiment one entry was made the intake and the other the return, and the igniting shot was placed in an offset at the center of the last crosscut between the two entries, so as to produce an equal effect on both entries. To further duplicate the conditions on the intake and return, each entry was loaded with the same weight of coal dust, similarly placed. Thus the conditions were identical in each of these entries, except for the direction of the air current, which was intake on one and return on the other entry.

In order to correctly interpret the results of this experiment, it will be necessary to consider the relative effect of the igniting shot and the initial blast on the intake and return currents respectively. For example, the air in the crosscut, on the intake side of the shot, was traveling with a velocity of approximately 14 ft. per sec. toward the shot, while that on the return side was traveling with the same velocity away from the shot. As a result, the initial blast causing the ignition of the dust in the vicinity produced an easy acceleration of the current on the return side of the shot, while on the intake side it set up a conflict of forces. In the return the air and dust were forced steadily ahead and away from the flame, while on the intake side the conflict of forces resulted in the thorough mixture of the air and dust, in close contact with the flame. Thus, on the return side, the conditions were unfavorable to the quick development of explosive combustion, but on the intake side they were favorable to the same.

The results of the test showed that the average velocity of flame between stations on the return was 182 ft. per sec., while that on the intake was only 131 ft. per sec. At a station on the return air course 150 ft. distant from the shot, a pressure of 1.4 lb. was registered by a recording gage, while at a station located at the same distance from the shot on the intake side a pressure of 2.4 lb. was registered. On the return air course, 550 ft. from the shot, the pressure had fallen to 1 lb., while at the same distance from the shot on the intake it had risen to 5 lb.

The conclusions drawn by the bureau engineers from the observed facts are stated, in the article to which I have referred, as follows:

> It would not appear from the pressure and velocity records that the high velocity of the air current had much influence on the development of the explosion. About the only variation in the action of the explosion in the two entries was that the velocity of flame on the return side was somewhat greater than that on the intake side. While this may have been an effect of the ventilating conditions, it was probably more a matter of chance than an effect of the air current, since the explosion was so slow.

No explanation is given for the conclusion that the slower advance of the explosion on the intake side should make the slower flame velocity on that side "a matter of chance," or why the fact that flame travels faster with the draft or in the direction of least resistance should have no application in this case.

It is freely admitted that conclusive proof in regard to the effect of an air current of high velocity on the development of a dust explosion cannot be established by a single test. Assuming that these results were not "a matter of chance" and without other evidence than that of this test, all that can be said regarding the possible effect of the high velocity of the air is that the initially low and decreasing pressure on the return indicates that the air moving away from the shot at a velocity of 14 ft. per sec. apparently prevented the early development of explosive combustion on the return, while the initially higher and increasing pressure observed on the intake indicates that the air moving toward the shot at a velocity of 14 ft. per sec. apparently promoted the earlier development of explosive combustion on the intake.

The bureau engineers state that "the pressure, as recorded by the different manometers, showed that the explosion was light, partly due to the dust being mixed, and perhaps also due to the wet condition of the mine." Another deterrent feature in this respect might have been mentioned as follows: The prevailing air conditions, notwithstanding the fairly high velocity of the air current, were probably not favorable to the development of violent explosive effects in the mine. My reasons for this conclusion have been stated in previous letters to *Coal Age*, Vol. 6, pp. 518 and 761, and need not be repeated here, since they could not be applied in the interpretation of the results of this test as the engineers have not given the barometric pressure and the temperatures in the mine and outside at the time of making the test.

Further, experience has proved that at the season of the year when this test was made (June) mines are practically immune from dust explosions. I know it will be claimed that the presence of an increased amount of moisture in the mine in the summer season accounts for this immunity, and no doubt it does in part. However, proof has been steadily accumulating that the presence of moisture is not the sole and probably not even the principal cause of the absence of these explosions during warm weather, but that air conditions more likely determine the results.

Considerable progress in the solution of the problem would be possible if another experiment were to be made in the Bruceton mine next winter, at a time when the outside temperature is below the freezing point. This test should be made under identically the same conditions as the test in June to which I have referred. I think it is a safe prediction that such a test would not only bring out the dominant influence of the air factor, but would also show that the editor's conclusion, *Coal Age*, Aug. 21, p. 303, that "though moisture is probably a protection it is not an unquestionable guarantee of safety," is based on the truth.

JOHN VERNER,
Former State Mine Inspector.

Chariton, Iowa.

⁂

Compensation in Relation to Constitutional Rights

Letter No. 2—I was much interested in the article of Sim. C. Reynolds, *Coal Age*, Sept. 25, p. 515, on the relation of the Workmen's Compensation Act to their constitutional rights. Mr. Reynolds' letter seems to draw an analogy between the curtailment of a constitutional right and an unconstitutional wrong. It is immaterial that the constitutionality of the one is political and the unconstitutionality of the other physical and moral. The former is governed by the exercise of an arbitrary power, while the latter can be controlled only by the force of moral suasion.

Speaking of the "quiet acceptance" of the compensation act by mining men, Mr. Reynolds states that it "indicates a satisfaction in the accomplishment at last of a duty long deferred by the state." He assigns no reason, however, why this duty has been so long deferred and then passed by the Assembly at its recent session. In my previous letter I endeavored to ascribe a reason for the nonpassage of this act, and though my explanation may appear to reflect a prejudiced opinion, I am convinced that it is worthy of consideration. I believe that the true reason why such an act has not been passed before is that it has not suited the ideas of employers of labor. No measure that is intended to materially benefit the laboring man will meet with the approval and sanction of his employer unless such benefit can be conferred without jeopardizing or inconveniencing the interests of the latter.

My letter was designed to call particular attention to sec. 302 of the compensation act, in which it is made optional with the employer and employee to accept or reject the provisions of the act. I feel sure that the general opinion would be that an employer would be more willing to avail himself of this proviso than an employee. This conclusion is warranted by the proviso in the act, which states: "It shall not be lawful for any officer or agent of this Commonwealth . . . to give such notice of rejection of the provisions of this article to any employee of the state," etc. The act is thus made compulsory for the state, but not for the individual or corporate body. There may be good and sufficient reason for this provision of the act which it is unnecessary to consider in this connection.

When an employee does not accept the provisions of art. 3 of the compensation act, it is true he is not deprived of his constitutional right to secure redress for injury through a process of common law; but this, as Mr. Reynolds has very empathically pointed out, is uncertain at the best. Thus, it is clear that the administration of the act becomes a potent force in opposition to a process of common law seeking redress for injury to an employee.

Mr. Reynolds presents a very plausible argument on the relative value to an employee of the free exercise of his constitutional right and the material compensation under the operation of the act. He has evidently assumed that my reference to the waiver of his constitutional rights, on the part of an employee, was of greater intrinsic value to him than the material benefit to be derived through the compensation provided under the act. I heartily agree with Mr. Reynolds that such is not the case and wish to say that it was not intended to be implied in my previous letter. I cannot, however, so heartily concur with him in his eulogy of compensation laws in general and the operation of such a law in Pennsylvania in particular, especially when its enforcement is based on such radical changes as have been required in the mining law, in order to bring mine employees under the operation of the act.

I do not want to be classed as one resting in complacent satisfaction that the actual test of this law will prove its adequacy. I believe it is fraught with conditions inimical to the desired good. One feature of the situation that supports this conclusion is that in order to make the compensation act acceptable to the coal operators it was necessary for the state to surrender all rights of supervision and control in the operation of the mines. This concession places the operation of coal mining outside of state supervision and makes it a law unto itself, which will be inevitably the expression of a single party only to the matters in controversy. I want to ask, Is not this pure class legislation?

For the purpose of argument let us assume that every coal-mining operation in the state elects to come under the provisions of this act. Having paid to the State Workmen's Insurance Fund the necessary premiums to insure themselves against liability for accident to their employees, the companies are free to operate their mines without respect to the provisions of any previously existing mine laws. As a result the safeguards thrown around the coal miner are destroyed by the practical annihilation of many of the provisions of the mine law. Evidence of this fact is to be found in the amendments Nos. 329 and 330 by reason of which the statutes thus amended become practically inoperative.

The reading of these amendments drives one to the conclusion that the preservation of life and prevention of injury to employees in the discharge of their duties in the mine are made matters of secondary consideration. By the payment of a stipulated premium, the operator is made secure against loss for accident or injury to employees while at work. I would ask, Why should an operator incur additional expense to protect his employees from injury when he has already paid for any damages that may arise therefrom? It is useless to urge the plea of humanity, in reply. I believe it is Blackstone who remarked, "Corporations have no souls," and it is impossible to convict or convince them on the principles of humanity.

In closing, I want to repeat a statement made in a prominent daily publication of this state to the effect: "The father of a large family applied for work at his usual vocation and was refused on the ground that he was a poor risk under the proposed compensation act." Is it not true that employers will select only the best possible risks consistent with the work to be performed? Many a laborer who is well-adapted by a lifetime of service in the mines will thus be deprived of his God-given right to earn the reward for his labor. As a miner I daily face the dangers of a miner's life. I am not an opponent of compensation, but would strongly advocate a law that would distribute the burden of each individual on the shoulders of all who profit or benefit by his toil. Wage earners are an absolute necessity to the welfare of the entire community, and compensation for injury or death in the performance of their duties is rightly the burden of the community whom they serve and of which they are a part.

A. M. Iner.

——, Penn.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

Use of Logarithms—By the use of logarithms the processes of multiplication, division, involution and evolution are greatly shortened and simplified. The two latter processes are in fact a repetition of the two former; while division and evolution are the reverse operations of multiplication and involution, respectively.

It is important to observe that the use of logarithms enables the finding of decimal powers and decimal roots of numbers, which is impossible by other means. When a decimal index of a power or root of a number can be expressed as a fraction the numerator and denominator of such fraction express respectively the indices of the power and root or the root and power, as the case may be. The decimal index, therefore, expresses in one operation the extraction of any given root of any given power of a number, which will be better understood later.

The application of this principle is shown in numerous instances where quantities vary in their relation to each other according to different powers. For example, in fan ventilation, the fourth power of the speed (n^4) of the fan varies as the fifth power of the quantity (q^5) of air in circulation; which is expressed as follows:

n^4 *varies as* q^5

or n *varies as* $q^{\frac{5}{4}}$; or $q^{1.25}$

and q *varies as* $n^{\frac{4}{5}}$; or $n^{0.8}$.

The expression $n^{\frac{4}{5}}$ or the four-fifths power of n is identical with $\sqrt[5]{n^4}$ or the fifth root of the fourth power of n. Hence, to extract the root of a power, divide the exponent of the power by the index of the desired root and the quotient will be the new exponent, which combines the two operations in a single transaction.

Rules for the Use of Logarithms—The following four simple rules cover all the operations of logarithms:

1. Multiplication: To find the product of two or more numbers, add their logarithms; the number corresponding to this logarithmic sum is the desired product.

In other words, the logarithm of the product of two or more numbers is equal to the sum of the logarithms of the numbers.

2. Division: To divide one number by another, subtract the logarithm of the divisor from that of the dividend; the number corresponding to this logarithmic remainder is the required quotient.

In other words, the logarithm of the quotient is equal to the logarithm of the dividend minus that of the divisor.

3. Involution: To find any given power of a number, multiply the logarithm of the number by the exponent of the power; the number corresponding to the resulting logarithm is the required power of the given number.

4. Evolution: To find any given root of a number, divide the logarithm of the number by the index of the root; the number corresponding to the resulting logarithm is the required root of the given number.

The Coal Age Pocket Book

Arithmetical Complement—The arithmetical complement of a logarithm is the remainder found by subtracting the log from 10; the logarithm of 3 is 0.47712, and its arithmetical complement is, therefore, 10 — 0.47712 = 9.52288. Its use involves subtracting from the final result as many tens as have thus entered the solution. The antilog is more convenient for use.

The Antilog—The solution of problems frequently involves the multiplication and division of many quantities. In the use of logarithms, the sum of the logs of the divisors would be subtracted from the sum of the logs of the multipliers, to obtain the log of the final result. By the use of what is called the "antilog" of each divisor, it is possible to complete such a solution in a single operation, by adding together the logs of the multipliers and the antilogs of the divisors.

The **antilog** of a number is obtained as follows: Subtract the mantissa of its log from 1, for the mantissa of the antilog. Then, add 1 to the characteristic of the log and change its sign, the addition being always algebraic. The following examples will make the process understood:

1. To find the antilog of 800: Log 800 = 2.90309
Mantissa of antilog, 1 — 0.90309 = 0.09691
Characteristic of antilog, 2 + 1 = 3; and changing sign = — 3
Hence.......... Antilog 800 = $\bar{3}.09691$

2. To find the antilog of 2: Log 2 = 0.30103
Mantissa of antilog, 1 — 0.30103 = 0.69897
Characteristic of antilog, 0 + 1 = 1; giving — 1
Hence.......... Antilog 2 = $\bar{1}.69897$

3. To find the antilog of 0.4: Log **0.4** = $\bar{1}.60206$
Mantissa of antilog, 1 — 0.60206 = 0.39794
Characteristic of antilog, — 1 + 1 = 0 (zero has no sign)
Hence.......... Antilog 0.4 = 0.39794

4. To find the antilog of 0.00125: Log **0.00125** = $\bar{3}.09691$
Mantissa of antilog, 1 — 0.09691 = 0.90309
Characteristic of antilog, — 3 + 1 = —2; giving + 2
Hence.......... Antilog 0.00125 = 2.90309

Note—The use of the antilog accomplishes the same purpose as the arithmetical complement and requires no correction of the final result as explained in reference to the latter. It should be observed that the antilog of a number is always the log of the reciprocal of that number. Thus,

Log 800 = *antilog* 1/800 or 0.00125

As shown above, log 800 = 2.90309; antilog 0.00125 = 2.90309.

Example—Solve the following by the use of logarithms:

$$p = \frac{ksq^2}{a^3} = \frac{0.00000002 \times 40{,}000 \times 50{,}000^2}{50^3} = ?$$

Solution—
log 0.00000002.......... $\bar{8}.30103$
log 40,000.......... 4.60206
log $50{,}000^2$ (4.69897×2).......... 9.39794
antilog 50^3 (log $50^3 = 1.69897 \times 3 = 5.09691$).. $\bar{6}.90309$
Log p 1.20412

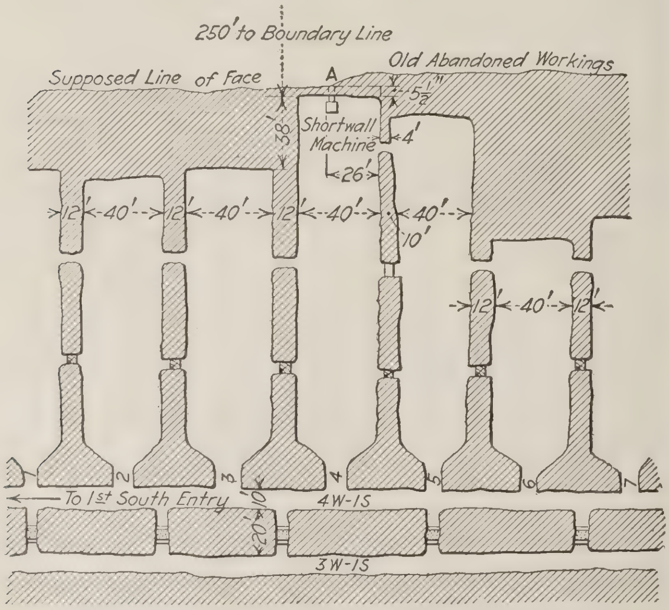
Hence p = 16 lb. per sq.ft.

Inquiries of General Interest

A Flooded-Mine Proposition

I would like to present for such advice as may be obtained through *Coal Age* and its readers an interesting and difficult proposition, which we have been up against recently in the operation of our mines. It is as follows:

Some time ago one of our shortwall mining machines cut through the breast of a room into an old abandoned mine, which was entirely filled with water. The machine was working at the time in No. 4 room of the fourth west off the first south entry. As shown in the accompanying sketch, the cut was started at the right rib in the face of the room and had proceeded 26 ft. across the breast when the water suddenly broke through into the room. As the coal dips toward the face, it was not 15 min. from the time the machine cut through until the water flowing in from the old workings had entirely filled the room to within 18 in. of the roof, and flowing through the last breakthrough between rooms 3 and 4, the water reached the lower portion of the south entries, which are not shown in this sketch.



PLAN OF ROOMS, SHOWING WHERE MACHINE CUT THROUGH INTO ABANDONED MINE

So rapid had been the inflow of water that the machine men were unable to withdraw the machine from the undercut, where it still remains, and everybody left the mine. In company with the mine boss, however, I immediately went into the mine and ascertained that there was a very large stream of water flowing through the break and that it would soon flood the entire mine. We at once set to work and built a concrete bulkhead across the two south entries, and by this means we were able to hold back the water and prevent its reaching other portions of the mine. At the same time we ordered pumps sent by express, and these were installed and put in operation in time to prevent further inundation.

The equipment installed consisted of two two-stage 5-in. centrifugal pumps and two 5-in. plunger pumps. These four pumps proved to be able to handle the water, and later it was found that they were gaining on the inflow. The water was gradually reduced in volume so that it was possible to continue operating the mine every day. Investigation showed that the inflow was largely reduced by reason of the heaving of the bottom, which partly closed the opening made by the machine. Owing, however, to the water having cut out some of the bottom coal, the flow still ranged from 700 to 800 gal. per min.

I would like to ask *Coal Age* and its readers what is the best method to pursue in this case, in the erection of a permanent stopping across the face of the room that will be sufficiently strong to withstand the pressure of the water so that there will be no fear of further trouble in the future. Will it be possible or practicable to wall off the coal face in No. 4 room and those adjoining it, in such a manner as to make the place secure? What should be the thickness of such a concrete wall, and how should it be constructed? I would greatly appreciate any practical suggestions that will assist us.

WILLIAM W. MILLER, General Manager,
Pittsburgh Mining Co.
Pomeroy, Ohio.

The proposition presented by correspondent is one that will interest a large number of *Coal Age* readers, who are invited to give their suggestions and to state what in their opinion is the best method to pursue. Unfortunately, correspondent has omitted to give several important data that are absolutely required before an intelligent answer can be given to his question.

It may be assumed, however, that the water is flowing into the mine under a head of, say, 100 ft., the present rate being 700 or 800 gal. per min. The mine is a drift opening in a generally flat formation, the coal being the No. 8 seam in Ohio, which is 4½ ft. thick in this mine.

In answer to the request of correspondent, let there be many suggestions by readers in regard to the most practicable means to be adopted in this case, in order to insure the future safe operation of the mine. To start the discussion, *Coal Age* would suggest the feasibility of sinking drillholes at the faces of rooms 3, 4 and 5 of a size—say 4 or 6 in. in diameter—to enable good cement grouting to be run into the mine.

This suggestion assumes that the pumps installed are capable of draining these rooms and controlling the inflow of water sufficiently to enable the erection of a strong timber bulkhead, say 3 or 4 yd. back from the face of the coal, so as to confine the grouting run in through the drillholes, in the space between the bulkhead and the face of the coal. In order to form a water-tight joint at the floor and roof of the seam, shallow trenches or troughs should be dug in the floor and the roof the entire length of and within the bulkhead, the purpose being to prevent an even joint.

Examination Questions

Alabama Fireboss Examination, Held July 26-29, 1915

Selected Questions

Ques.—What dangers may arise from improperly putting together a safety lamp?

Ans.—When a safety lamp is not properly assembled, either from some of the parts being omitted or not fitted accurately together in their right place and made secure, there is danger that the flame of the lamp or the flame of the gas burning within the lamp may pass through the small apertures furnished by the improperly fitting parts and ignite the gas outside of the lamp. In order to provide the desired security, all openings to the lamp must be protected by standard wire gauze, which under normal working conditions prevents the passage of flame from within to the outside atmosphere. When a lamp is improperly put together, there is danger of the parts working loose, and the improper assembling of the parts may also invite an incautious miner to tamper with the lamp in an attempt to improve its condition.

Ques.—Is it possible to have an explosion in a mine when the lamp gives no indication of the presence of firedamp?

Ans.—Yes. A blownout or a windy shot may result in a dust explosion under conditions that make this possible where the coal is soft and inflammable and fine dust and slack have been permitted to accumulate at the working face. It has been amply proved that the fine dust of an inflammable coal is capable of explosion, in the entire absence of combustible gas. Instances are on record where ignition of gas and dust has taken place and explosion followed as a result of a heavy fall of roof, in a particular rock formation capable of striking sparks. Such was the case in the Bellevue mine explosion, Dec. 9, 1910, at Alberta, Canada, as described in *Coal Age,* Vol. 3, p. 985.

In the mining of a highly inflammable coal a combined explosion of dust and gas is possible when the percentage of gas present in the air is much below what is indicated by the ordinary Davy lamp or what is commonly observed in the examination of a mine for gas by the fireboss.

Ques.—What dangers may arise from the improper care and handling of safety lamps by workmen?

Ans.—Owing to improper care on the part of the workman, a safety lamp may become clogged with dust and oil so as to be dangerous for use. Or the lamp may be placed in such a position as to become injured by falling slate or coal, or by an accidental blow of a pick or other tool, or it may fall from its position and be overturned. In any such case there is danger of the lamp passing flame, either by being injured or by reason of its fall, or by the flame impinging against the gauze of the lamp and heating it to redness should the lamp be overturned by accident.

There is also danger of a safety lamp passing flame when it is improperly handled. For example, the lamp may be swung to and fro when being carried, or it may be exposed to a strong air current or carried too rapidly against the air current passing in an entry, or it may be exposed for too long a time to gas, or the gauze may become heated by the lamp being held in an inclined position or by reason of too large a flame in the lamp. In any of these cases the lamp is unsafe.

Ques.—What are the dangers arising from the use of powder in dry and dusty mines?

Ans.—The use of powder in dry and dusty mines is always attended with more or less danger from the possible occurrence of a windy or blownout shot, as the result of overcharging the hole, or insufficient tamping, or the improper placing of the hole, the charge being laid too deeply on the solid, or the coal not being properly mined or sidecut, or the presence of fissures or crevices in the coal, or the shot blowing through into adjoining rooms or workings. There is also danger from the use of too quick a powder for the coal being mined, or the firing of two or more shots at the same time in the same working place, or mixing different grades of powder in blasting. It is important to permit no accumulations of fine dust and slack at the face when blasting, and only permissible powders should be used in such mines.

Ques.—In an airway 8 ft. wide and 6 ft. high, the air has a velocity of 420 ft. per min.; what is the volume of air passing per minute?

Ans.—The area of this airway is $8 \times 6 = 48$ sq.ft. Then, assuming that the velocity given is an average velocity for the entire area of the airway, the volume of air in circulation is $420 \times 48 = 20{,}160$ cu.ft. per min.

Ques.—If certain working places in a mine generated gas frequently and other working places gave off little gas, which would you examine first in making your rounds in the morning, and for what reason?

Ans.—This question cannot be intelligently answered without further information. If the mine is properly ventilated, it may be assumed that the section of the mine generating gas frequently, has its own separate air split and that the return from this section is not permitted to pass through the other portions of the mine, but enters at once into the main-return airway. In such a case it would be natural for the fireboss to proceed first to examine the gaseous section, for the reason that if gas has accumulated in that section, steps should at once be taken for its removal, and there would be less danger of an accident during the examination of the other portions of the mine.

Assuming, again, that the places frequently generating gas are distributed in different portions of the mine, it would not be possible to examine these places, except in their regular order. The fireboss making the morning examination of the mine, having examined the ventilating apparatus to see that it is working properly, proceeds at once to the bottom of the intake or downcast shaft and follows the intake air in its course throughout the mine, examining each place in regular turn.

Book Reviews

An Encyclopedia of Mining

LIBRARY OF COAL MINING AND ENGINEERING. 8 vol., comprising 3026 pp., including introductions and indexes. 5½x8½ in. Well illustrated. McGraw-Hill Book Co., Inc., 239 West 39th St., New York City. Price $16, cloth boards.

This handy grouping of interesting information bearing on coal-mining plant operation will be of interest to every mining man. In most cases the volumes thus assembled have not been specially written for his reading. Nevertheless, they appear to fit in admirably with the needs of the engineer and manager, though in places they contain some material not altogether germane to coal mining and they omit entirely some subjects which from time immemorial have been considered as having a paramount interest to mine officials.

From the earliest days we have taken geology as the fundamental study of mining and harrowed our minds with all the freakish developments of a planet out of gear. But it is refreshing to see a book which realizes that the mine is a machine shop and not a classroom for field geology. The books mark an era—the passing of the mining man who regarded himself as a brother to the civil engineer and his replacement by one who looks at coal mining largely as a mechanical problem.

CHIEF STUDY IN MINING IS MACHINE OPERATION

In fact it is time for mine managers to put aside the misconceptions fostered by early association and training and to treat the mining problem as a study of mining and not of coal hunting, surveying and mine gases, though these subjects have their value. But there is nothing so likely to keep us back in development as to have too large a stress laid in our training on the less essential elements.

In many mines, blest with a reasonably level bed and coal of even thickness, the problems of haulage and of cutting are of paramount concern and the emphasis given them in this library is well justified. However, it must be conceded that these books should be supplemented by some chapters on mine gases, ventilating methods, mine projection, safety lamps, oil and electric, and a more extended reference to rope haulage than is included in these volumes. Mine cars, hoisting devices, cages, self-dumping devices also are allowed to pass without recognition. But to make up for these deficiencies the books are in some places remarkably strong.

Hubert E. Collins' "Erecting Work" is particularly desirable for a mining engineer. He has often found himself at his wits' end to meet difficulties in erecting, and usually, be it said, some working man, with just plain brains and no training in the university, has had to take the work off his hands and complete it. The engineer will be interested in chapters on "Knots and Hitches," "Runways on an Incline," "Work for a Gin Pole," "Rigging for the Receiver," "Moving a Cylinder," "Unloading a Heavy Shaft," "Rigging for a Heavy Lift," and "Some of the Lighter Work in Erecting."

The "Electrical Catechism," by George D. Shepardson, professor of electrical engineering in the University of Minnesota, covers in 400 pages the whole subject of electricity in its more elementary phases and in a most practical manner. Most electrical books carefully and skillfully disguise the facts; this volume makes them plain.

NO QUAINT IRRELEVANCES ABOUT THE PAST

It is Hubert E. Collins who supplies "Boilers, Pipes, Piping and Pumps," and as usual he tells the reader just what he wants to know. He does not say anything about Hero, Savary or Newcomen, but he harps on troubles and how to meet them. When the superintendent goes down to the works the fireman does not ask him what was the shape and capacity of the boilers of Lord Worcester, but he tells him the boiler is priming or won't make steam and wants to know why. It is the professor of steam engineering who never had boilers to run who fills up his treatise with irrelevant matters about Watts early studies on the operation of a kettle.

E. E. Sommermeier's "Coal" has been reviewed in these columns already. It is a preëminently practical book, written by a man who has had long experience in analyses. The operations of the analyst are conducted in the laboratory and not in the field. The professors are able to discuss them therefore as practically as field workers and keep their treatises free of the side issues with which books about field matters are too often cumbered. H. J. Thorkelson's "Air Compression and Transmission" is also an old acquaintance. It needs no further words of commendation.

Hubert E. Collins treats of "Steam Turbines" in his usual practical way. A. T. Shurick's "Coal Mining Surveying" is an old acquaintance of the readers of "Coal Age." R. S. Brinsmade's "Mining Methods" is a reprint of "Mining Without Timber," with the matter not germane to coal mining omitted. "Practical Shaft Sinking" is handled by a man of experience—Francis Donaldson, chief engineer of the T. A. Gillespie Co.

The "Power Catechism" is provided by F. R. Low, the competent editor of "Power." The information he provides is in clear language which cannot fail to make the meaning of the author readily comprehended. "Practical Mathematics," by Claude Irwin Palmer, associate professor of mathematics at the Armour Institute of Technology, treats simply of arithmetic, elementary mathematics, graphics, elementary trigonometry, logarithms and mensuration.

"Mining Equipment" and "Mine Organization and Safety" have been specially written for this series by Frank H. Kneeland, an associate editor of "Coal Age." They are both strictly uptodate, but are both somewhat too brief for the importance of the subjects treated. W. M. Weigel's treatise on "Ventilating Equipment," already published in "Coal Age," covers the subject of fans thoroughly, though it largely omits reference to the mathematical theory and practice of mine ventilation.

Electric Signals for Mines

ELECTRIC MINE SIGNALING INSTALLATIONS. By G. W. Lummis Paterson. Pp. viii + 191 + 4 index; 4⅞x7½ in. 139 fig. D. Van Nostrand Co., 25 Park Place, New York City, 1914. Price $1.50, cloth boards.

This book can be recommended without reservation to anyone who desires information on electric mine-signaling. It must be said, however, that wireless methods are not discussed and that no reference is made to telephones or telephonic wiring.

The writer opens up his book with accounts of "ringing keys and tappers," starting with the regular telegrapher's key, which is only suited to dry places. He describes later gas- and watertight keys, some of which are actuated by pushbuttons and others by bell-pulls located outside the box which contains the actual key.

Then follows a section on the various types of bells—the trembling type, which is apt to make a continuous stream of sparks and is dangerous in gas, the single stroke, the shunt and the differential bells. The advantages of the different bells are all set forth, and also their disadvantages for certain classes of work. A review then follows of the different types of mounting, the author dividing all signal bells into wood-box bells, block-signal bells, waterproof bells, gas- and water-tight bells and magneto bells.

A chapter follows on electric mining indicators or annunciators, these being divided into mechanical and electric replacement indicators, needle and visual-signal annunciators, the latter with continuous relay and electrical replacement. Bell-signal indicators also have consideration. In the next chapter electric generators for signal work are considered and the utilization of available alternating electric power by the aid of transformers and rectifiers, two types of the latter being described—the vibratory and the "Adnil." Cells and their handling are treated at some length, the cells described being various types of the Leclanché cell—the porous-pot with flat and cylindrical zincs, the central zinc or carporous, the agglomerate-block and the sack cells. The Fuller, or bichromate, cell receives a notice.

The wiring for shafts and engine planes is elaborated at length, and an appendix concludes the book, giving the special rules for the installation and use of electricity in coal mines under the Metalliferous Mines Regulation Acts, the Coal Mines Regulation Acts and the British Home Office regulations under the Coal Mines Act as far as these refer to signaling. The regulations of the Bureau of Mines, made we presume for the mine at Gebo, Wyo., and the electrical symbols for mine maps suggested by H. H. Clark, fitly conclude this excellent little book on a subject hitherto somewhat inadequately treated.

Coal and Coke News

Washington, D. C.

The Bureau of Mines has prepared and has just issued Technical Paper No. 97 on the subject of "Saving Fuel in Heating a House." The paper first discusses various kinds of fuel and affords the following outline of the advantages and disadvantages of various fuels.

Fuel	Advantages	Disadvantages
Wood	(*a*) Cleanliness, (*b*) cheerful fire, (*c*) quick increase of heat, (*d*) cheap in some localities.	(*a*) Low fuel value, (*b*) large storage space necessary, (*c*) labor in preparation, (*d*) scarcity, (*e*) does not hold fire long, (*f*) unsteady heat.
Anthracite	(*a*) Cleanliness, (*b*) easy control of fire, (*c*) easier to realize heat in coal than is the case with other coals, (*d*) steady heat.	(*a*) High price, (*b*) difficulty of obtaining, (*c*) slower response to change of drafts.
Bituminous coal	(*a*) Low price, (*b*) availability, (*c*) high heat value (in the best grades), (*d*) low percentage of inert matter (in the best grades).	(*a*) Dirty, (*b*) smoke produced, (*c*) more attention to fire and furnace necessary than with anthracite.
Subbituminous coal and lignite	(*a*) Relatively low price, (*b*) availability (in some regions), (*c*) responds quickly to opening of drafts.	(*a*) Slakes and deteriorates on exposure to air, (*b*) takes fire spontaneously in piles, (*c*) heat value generally low, (*d*) heat in fuel difficult to realize, (*e*) fires do not keep well, (*f*) gases generated over fire pot sometimes burn in smoke pipe, causing excessive heating.
Peat	(*a*) In general, the same as for wood.	(*a*) Low heat value, (*b*) bulkiness.
Coke	(*a*) Cleanliness, (*b*) responds quickly to opening of drafts, (*c*) fairly high heat value.	(*a*) Bulkiness, (*b*) liability of fire going out if not properly handled, (*c*) fire requires rather frequent attention unless fire pot is deep.
Oil	(*a*) High heat value, (*b*) immediate increase of heat, (*c*) cleanliness, (*d*) small storage space necessary.	(*a*) High price, (*b*) difficulty of safe storage.
Gas	(*a*) Ease of control, (*b*) cleanliness, (*c*) convenience, (*d*) immediate increase of heat.	(*a*) High price in many places.
Electricity	(*a*) Every advantage.	(*a*) High price.

The paper next considers types of heaters suitable for residences and small buildings and reaches the conclusion that hot-water equipment, while most expensive to install, is probably least costly to operate.

Methods of operation of heaters while in use with various sorts of fuel are finally discussed, the main points developed being as follows:

"1. The amount of fuel consumed in heating a house depends on many factors. Some of the factors are within the control of the householder; others are not.

2. Both convenience of operation and consumption of fuel depend on the system of heating (and ventilation) installed, and convenience, fuel consumption, and first cost should be considered in making a selection.

3. The heater should be large enough to meet continuously and without attention for periods of eight hours the demands for heat in all weather except the most severe.

4. Heating equipment that burns satisfactorily and economically one kind or size of fuel may not be well adapted to burning another.

5. Ascertain by experiment what fuel and what method of using it are best suited to your needs. As a rule, the effort to obtain this information will be amply rewarded by the saving that will result.

6. Attend to the fire regularly and try to anticipate the demands for heat.

7. Keep the heat-absorbing surfaces of the heater free from soot and dust by regular cleaning.

8. Heating systems often fail to meet the demand for heat in severe weather because of insufficient draft. To supply additional heat, the heater must be able to burn more coal.

9. The more probable causes of insufficient draft are:

a. Chimney not high enough, or having its top too near some tall object.

b. Chimney, smoke pipe, or gas passages of heater clogged with soot or débris, sometimes through the breaking of a partition between two flues in a chimney.

c. Leaky connection of smoke pipe to heater or to chimney.

d. Accidental closing of hand damper in smoke pipe.

e. Clogging of fuel bed by clinkers.

f. Too great a length of horizontal smoke pipe between the heater and the chimney."

The following general suggestions are offered for the firing of different fuels:

"Fundamentally, the process of combustion is the same for all fuels. Whether the fuel be wood, coal, or oil, heat is produced by the carbon or other combustible elements combining with the oxygen of the air. The oxygen and these combustible elements unite in certain proportions at certain temperatures and a definite quantity of heat is evolved in each case. Some of the heat is absorbed by other parts of the fuel, heating them to ignition temperature, and some of the heat is absorbed by the nitrogen in the air supplied—ordinary air contains about 80 per cent. nitrogen—and by the gaseous products of combustion, raising them to a high temperature. Part of the heat radiated from the glowing fuel or conveyed by the hot gases passes over the heating surfaces of the boiler or furnace, is taken up by the water or air heated, and is distributed to the rooms of the house.

"The admission of more air through the fuel bed or fire door than is required to furnish the oxygen necessary for complete combustion tends to cool the fuel bed and the gases that rise from it. As oxygen unites with combustible elements in definite proportions, the theoretical amount of oxygen and hence of air needed for the complete combustion of a given weight of coal can be computed. However, in burning any kind of fuel on a grate, considerable heat is lost in unburned material if only the quantity of air theoretically required be admitted, because it is practically impossible to get all of the particles of combustible matter in the fuel to unite with all the particles of oxygen in the air theoretically required. An excess of air must always be supplied, but this excess should be neither more nor less than is necessary to insure complete combustion.

"The importance of providing an inlet for the air that must enter the furnace room is frequently overlooked, especially in small, tightly-closed furnace rooms. Roughly, 150 to 300 cubic feet of air are required for each pound of coal burned, and, to prevent trouble from insufficient draft, some means for admitting this air to the furnace room must be provided. Usually enough air leaks into the furnace room through cracks and poorly fitting windows, but the tighter the construction of the room the greater the need of an air inlet."

Then follow suggestions "which have to do especially with preventing incomplete combustion and the admission of a large excess of air into the furnace, and the minimizing of the attention necessary to maintain the proper temperature in the rooms heated."

HARRISBURG, PENN.

Employers of labor who have not yet a good understanding of the child labor law and the workmen's compensation bill passed at the last session of the Legislature may find assistance at the branch offices of the state which will be opened in the anthracite and bituminous coal field the latter part of this month.

A force of investigators has been employed to gather information as to the number of children employed about coal mines and other industries who will come under the continuation school requirements and as to the number of employees who will come under the provisions of the compensation act.

Children under 14 years may not be employed in any industry, but, children between 14 and 16 who are employed must be given instruction for a certain number of hours every week. Since they cannot very well be placed in classes with children who attend school regularly it is incumbent upon the authorities to make special provision for them. The working children may be placed in separate buildings or in separate rooms or they may be given instruction in offices of the collieries or mines or mills and factories in which they are employed, but the arrangements must be attended to by the school directors of the community.

It is doubtful if many of the larger coal companies will stand for this annoyance of adjusting their working conditions to the requirements of the law, and will discharge all boys under 16.

There is yet much doubt in the minds of many employers of labor as to their liability under the compensation, especially as to those who are only employed periodically and the insurance features of the act.

There are three ways to carry insurance. These are the state fund, mutual companies and the old-line stock companies. The state fund is a misnomer, for except for the first three and a half years, no state aid is offered. After that all cost must come out of the premiums. Hence the fund must be self-supporting. The one great advantage of insuring in the state fund is that on payment of the premium there is relief from personal liability, possible claims going against the fund and not the employer. There is no lien against his property. There is another side, however, to the state fund, it is pointed out. It can insure only on the compensation side of the law. It does not afford the broad insurance offered by the insurance companies. It cannot insure against suits at common law defense.

Mutual companies will be operated without profit, and whatever surplus accrues is returned to policyholders, while a stock company works primarily in the interests of its stockholders and secondarily in the interests of those who insure with it. The drawback of the mutual, which it is said is being considered by many coal companies, is that policyholders may be called upon for a second assessment within a year if a big loss is incurred which requires additional funds. But to offset this the insurer knows that in case there is a surplus he will get his share back.

PENNSYLVANIA

Anthracite

Tamaqua—The night schools for mine workers are beginning their sessions throughout the anthracite region, and mine workers are taking advantage of the courses of instruction. Students of these schools last spring secured approximately 20 mine foreman's certificates and 50 assistant mine foreman's certificates. The number of students now enrolled in these schools exceeds that in the membership of the mining institutes which were their forerunners.

Pittston—A track walker on the Lackawanna & Wyoming Valley R.R. (the Laurel Line), recently discovered a cave under the north-bound rails in time to prevent the wrecking of a train that was overdue. Mining in surface veins is believed to have caused the subsidence. The road has had much trouble with caving and once was obliged to re-route the tracks between Pittston and Avoca.

Lansford—All collieries of the Lehigh Coal and Navigation Co. are now working to full capacity. The demand for railway equipment is so great that a large number of foreign cars are being loaded.

Pottsville—After investigating the recent disaster at the Coaldale mine, James E. Roderick, chief of the State Department of Mines, has stated that there was no negligence on the part of the company officials or of the mining department. It had been rumored that the miners' organization intended to take action against the company.

The Schuylkill County court has upheld the Lehigh Coal and Navigation Co. in a suit to enforce a reservation in a deed restricting the sale of liquor on a piece of ground which the company sold at Coaldale. A saloon-keeper had endeavored to transfer his business to the property and the decision in this suit practically makes prohibition territory of all the company's land.

The Lehigh Valley Coal Co., on Oct. 9, announced the immediate resumption of work at the Blackwood colliery at Blackwood. There has been no work at this colliery since last June. Seven hundred men and boys will be given employment.

Shenandoah—All the collieries in this section worked full time the past week, the first time in 10 months. It was semi-officially announced on Oct. 9 that full time would continue in this region during the coming winter.

Bituminous

Uniontown—Operators in this region, confident that coke will reach the high-water mark of $3 by the first of March, if it does not go beyond that figure, are refusing contracts for a year's delivery at $2.25 a ton. Practically every oven in the region is now in operation and the output is practically on a capacity basis. The labor proposition is becoming a problem to the operators hereabouts and is causing them much trouble.

The sale of 3,000 acres of the West Virginia coal held by local people, which has been pending for the past few days, will not be consummated according to a statement of one of the interested parties. For nearly a week negotiations have been under way whereby a Pittsburgh concern was to secure the coal lands, but there is practically no chance of the deal being completed, the owners maintaining a stiff price for their holdings.

Elco—The last car of coal was hauled out of the old Vesta No. 2 mine a few weeks ago and the work of tearing up the tracks, removing the machinery and dismantling the plant generally is now under way. This famous old mine was known 30 years ago as the American works and passed through several hands before it finally fell into possession of the Vesta Coal Co.

Standard—Forty ovens were blown in at the Standard mines of the H. C. Frick Co., recently, giving employment to additional men and putting 90 per cent. of the ovens into operation. Thirty additional ovens have also been fired at the Dorothy plant of the Frick company.

Pennsville—The plant of the Pennsville Coke Co. is being dismantled and the equipment sold. Operations ceased about two years ago after 41 years of almost continuous activity.

Connellsville—The Connellsville coke region is now producing approximately 400,000 tons of coke per week. The H. C. Frick Coke Co. recently put 500 additional ovens into operation, and the majority of the plants are working full time except when handicapped by labor scarcity. There appears to be no actual car shortage but railroads are pressed to provide adequate transportation facilities.

WEST VIRGINIA

Kingwood—The Deaker Hill Coal Co. recently became the owner of several coal tracts situated in the Kingwood district along Morgans Run. It is intimated that the coal will be operated in the near future. It is believed that an opening will be made on Morgans Run near Irona, the coal being shipped over the West Virginia Northern R.R.

Charleston—It is estimated that 8000 Greeks will leave the mines of West Virginia within the next few months. It is thought that the shortage resulting from their departure will be even more serious than that due to the recall of the Italian reservists.

The Supreme Court of Appeals recently granted an alternative writ of mandamus against Lee Ott, state compensation commissioner, compelling him not to require the United States Coal & Coke Co. to pay the sum of $17,054.79 or any part thereof which the commissioner demands, as the proportionate part of all liabilities against the Workmen's Compensation Fund, or show cause why he should do so. This writ is returnable Oct. 19.

Grafton—One hundred and eleven men recently took the examination for mine foreman and fire boss. It was anticipated that not over 100 candidates would present themselves, and the increased number which appeared was highly gratifying to the men in charge.

Morgantown—It is reported that the Powellton and Elk Ridge operations will work every day for at least one year. It is reported that the coal company has closed some fine contracts, to fill which will require the constant operation of all the mines on Armstrong Creek for a period of not less than 12 months.

Wheeling—It is reported that a car shortage throughout the state is handicapping coal operations. The main cause, it is said, is the commandeering of coal cars for the handling of farm crops in the West, the crop which takes most of the coal cars being said to be sugar beets.

Huntington — Communications have been received from coal companies in the Logan field asking the employment bureau here to furnish as many as 200 miners at once for immediate employment in their fields. The Ethel and Bengal coal companies have made requests for large numbers of miners in the past few days.

ALABAMA

Dogwood—The Montevallo Domestic Coal Co. which was organized recently, has opened a slope which was started some few years ago on the Montevallo seam. This will shortly be shipping a good output of coal, the average thickness of the seam being 3 ft. 9 in. of clean fuel.

TENNESSEE

Harriman—Creditors of the Big Brushy Coal Co. of Petros, which recently went into a receiver's hands, have decided to continue the business.

KENTUCKY

Whitesburg—There is little car shortage complaint now among the coal operators of the eastern Kentucky field. Operators have no trouble to get all the cars they can load. All the mines of the Elkhorn field are running full time.

The Diamond Block Coal Co. has several hundred men at work constructing a mining town on the Buffalo Creek branch of the Louisville & Nashville Ry. in Perry County.

INDIANA

Fontanet—The Coal Bluff Mining Co.'s mine which has been closed for a large part of the summer has been reopened with a full force, about 400 men.

ILLINOIS

Marion—The West Virginia Coal Co., which has been operating a mine on the Iron Mountain R.R. at this place, is making arrangements to sink another shaft 1½ mi. north of the present one, on the Illinois Central R.R. Work is to be begun soon. The present mine has an output of 1500 to 2000 tons a day. The new shaft will enable the company to greatly increase its output and ship by the Illinois Central as well as the Iron Mountain. The company also has some inner group mines near Belleville.

Marissa—The Egyptian Coal & Mining Co. has resumed operation at its mine here after having been closed down for a year on account of business depression. Electric mining machines have been installed. The mine will give employment to 75 men. The output will be handled by the Kolb Coal Co., St. Louis.

Mount Olive—The Progressive Club of Mount Olive held a mass meeting a few days ago to discuss steps to prevent the closing down of Mine No. 5. The Madison Coal Co., which owns the mine, has decided to abandon it but will leave it as it stands and lease it if some arrangement to that end can be made. The mine is said to be in good condition, with enough coal to run for several years.

New Baden—The New Baden mine of the Southern Coal & Mining Co. is soon to be closed and coal taken for all requirements from the company's mines at Belleville, the Little Oak and the Shiloh. The New Baden mine has been working steadily and the other two only about half time. It is announced that the two mines will be worked regularly after the New Baden mine is closed. The two mines employ 700 men.

IOWA

Des Moines—Owners of the Miners' hospital at Albia have acquired the Drake university medical building and grounds in this city to be used primarily as a hospital for coal miners in this vicinity. The institution will be known as the Iowa Industrial Hospital of Des Moines and will be operated under plans similar to the one at Albia excepting that the field of operation will include employees of various other industries as well.

Knoxville—The state board of control is prospecting for coal at the Knoxville inebriate asylum, in hope of striking veins of sufficient thickness to supply various state institutions. Workmen report finding a 3-ft. vein. Additional borings will be made to determine whether it is continuous. The board of control uses 110,000 tons of coal annually at the state institutions, and if even a portion of the fuel can be mined at Knoxville, a big saving can be made.

TEXAS

Lytle—The Lytle Coal Co. has begun the sinking of a shaft near the mines of the Carr Coal Co. which were operated here up to about two years ago. The new mine will be developed at once. About 50 men are at work sinking the shaft.

OKLAHOMA

McAlester—Increased activity in the coal fields here is reflected by increased pay rolls of the mines operating in this section. Coal operators say the activity here is due largely to the increased demand for export coal. The monthly pay rolls of the mines in this district will amount to $600,000. At present 10,000 tons of coal is being produced daily.

COLORADO

Denver—Examinations by the board of examiners for mine official certificates will be held in nine cities of the state during November. These examinations will be as follows: Glenwood Springs, Nov. 8; Grand Junction, Nov. 9; Gunnison, Nov. 11; Canyon City, Nov. 12; Walsenburg, Nov. 15 and 16; Trinidad, Nov. 17 and 19; Colorado Springs, Nov. 20; Denver, Nov. 22 to 24; Steamboat Springs, Nov. 26.

FOREIGN NEWS

Nanaimo, B. C.—Thomas Graham, provincial inspector of mines of British Columbia, and J. H. Tonkin, manager of the Pacific Coast Coal Co., Nanaimo, B. C., were recently committed for trial by Magistrate Scott of Nanaimo on a charge of manslaughter arising out of the accident at the Reserve mine last February in which 20 lives were lost. It is charged that inaccurate maps of the mine and of adjoining mine workings were allowed to be used by the officials.

Toronto, Ont.—The annual report of the Mines Branch of the Department of Public Works of Alberta for the calendar year 1914 shows a total coal production of 3,821,739 short tons, being a decrease of 421,034 tons as compared with 1913. Of the total output 1,953,367 tons was bituminous, 1,697,401 lignite and 170,971 anthracite. The total number of mines in operation was 264. The number of new mines opened was 42 and the number of mines abandoned 45. The average number of persons employed was 8,170. Coke was produced to the amount of 29,058 tons and briquettes to the amount of 109,082 tons. The number of deaths caused by accidents inside the mines was 208, which includes 189 persons killed in the Hillcrest disaster, in addition to which 35 persons were seriously and 45 slightly injured by accidents inside the mines. Considerable progress has been made in training for mine-rescue work, a station having been installed and equipped at Taber and a mine rescue car in the Canmore district. Instruction in mine-rescue work was given to 330 persons. The report notes that apart from the Hillcrest disaster 41 per cent. of the accidents occurred in mines producing under 100,000 tons per year, which is probably due to the fact that mines where fewer than 30 men are employed are under the charge of men who do not hold first-class certificates and are not as conversant with the provisions of the Mines Act as those in charge of the larger mines.

PERSONALS

John Whelan, Jr., of Massillon, Ohio, has accepted the position of secretary of the Pittsburgh Vein Operators Association, succeeding John Zelenka.

N. S. Hachita, an engineer for the Lehigh Valley, spoke on "Concrete and Its Ingredients," at the opening fall session of the Pittston Mining Institute.

Owen C. Jones, of St. Clair, Penn., by appointment of the Schuylkill County board, succeeds James Kennedy as mine foreman examiner of the eighth anthracite district.

John C. Williams, foreman at Thomas shaft, and John McNulty, foreman at Butler colliery, of the Pennsylvania Coal Co., have been transferred, each taking the other's place.

W. O. Davis, secretary and treasurer of the Kentucky River Coal Corporation is spending several weeks in Hazard, Ky., clearing up a mass of detail work which has accumulated at the office.

Charles W. Mills, president of the Climax Coal Co., with offices in Philadelphia, was on Oct. 9, appointed by Secretary Wilson as a Federal conciliator to settle the strike of machinists in the job shops in Pittsburgh.

Samuel Dunn, of Chicago, editor of the "Railway Age Gazette," will speak in Louisville, Ky., on Oct. 19 under the auspices of the Louisville Transportation Club. He will talk on the relations between shippers and carriers.

J. L. Good, vice-president of the Pittsburgh & Buffalo Co., has severed his connection with that firm and accepted the position of general sales manager of the National Coal Co., of Cleveland, Ohio, with offices in the Rockefeller Bldg.

Samuel Anderson, for many years assistant mine foreman at the Seneca colliery of the Lehigh Valley Coal Co., has been appointed inside foreman at the Maltby colliery, at Maltby. He succeeds D. P. Thomas, who has been ill for a long time.

James Martin has severed his connection with the Paint Creek Collieries Co., and accepted the position of general manager of the Wyatt Coal Co., the McGregor Coal Co., the McCaa Coal Co., and the Macalpin Coal Co., with offices in the Union Trust Bldg., of Charleston, W. Va.

John F. Nuttal, a former mine manager of Southern Illinois who disappeared from Christopher, Jan. 19 last, has written to his wife, who is at Marion, Ill., that he is now a sergeant-major in the Royal Engineers of the English Army. The letter was written from Southampton, England.

OBITUARY

C. E. Sauters, of Martins Ferry, Ohio, superintendent of the Gaylord mines Nos. 1 and 2, died recently in St. Joseph's Hospital in Elmira, N. Y., following a long illness from a complication of diseases. He is survived by a wife and five children.

William Parker, of Toronto, Can., died suddenly Oct. 5. He was at one time a well-known coal operator, and controlled several Pennsylvania mines, but retired from active business some years ago on account of ill health. He was 60 years of age at the time of his death, and is survived by four sons and three daughters.

INDUSTRIAL NEWS

Dorothy, Penn.—The Dorothy plant of the H. C. Frick Coke Co. recently received orders to fire up 30 additional ovens. This makes 160 ovens out of 230 in blast at this plant.

Middlesboro, Ky.—All records for traffic on the C. V. division of the Louisville & Nashville were broken on a recent Saturday when 500 odd loaded cars, mostly coal, and 100 empties passed over into Corbin.

Des Moines, Iowa — The principal office of the Carney-Cherokee Coal Co. has been transferred from this city to Carney, Iowa. An amendment to the articles of incorporation has been filed, providing for the change.

Frankfort, Ky.—The Federal Court has now under trial the case of the Kentucky Coal Lands Co., of New York against the Mineral Development Co., of Pennsylvania. This suit involves the title to 12,000 acres of coal land in Letcher county.

Huntington, W. Va.—It is stated that the Kentucky Mine Owners Assn., recently held a committee meeting adopting resolutions protesting against the proposed advance in rates on West Virginia coal destined to the markets of the Northwest.

Charleston, W. Va.—The coal carrying railroads have decided to file with the Interstate Commerce Commission a revised tariff which would increase the freight rate more than 25 cents per ton on eastern shipments from the West Virginia coal fields.

Des Moines, Iowa—First-aid teams are to be established not only in coal mines about Des Moines but also in the different industrial establishments. These teams will be instructed in giving first aid for all injuries from fractured limbs to broken backs.

Paducah, Ky.—Officials of the West Kentucky Coal Co. estimate that their losses in the recent hurricane at New Orleans will reach $170,000, involving as it did 72 loaded coal barges which went down. These were not insured. They sunk off Donaldson, La.

Charleston, W. Va.—Officials of the Chesapeake & Ohio R.R. recently met in this city to discuss the car shortage which has now existed for about five weeks, and which is the first one in approximately three years. It was stated, however, after the meeting that no immediate relief was in sight.

Ridgway, Penn.—The Erie R.R. is said to have recently received an order for 1,000,000 tons of coal, and it is said that shipment from Brockwayville mine has already commenced. It is reported that the coal is to be sent abroad from an eastern port. Four hundred train loads will be required to fill the order.

Greensburgh, Penn.—The Pittsburgh Coal Co. has entered suit against Jesse H. and Jacob L. Steger to recover the sum of $3,500 for coal alleged to have been mined by the defendants from the coal lands of the plaintiff. A total of 1,769 tons of coal is alleged to have been mined by the Sager Bros. from the plaintiff's holdings.

Natchez, Miss.—The Pittsburg Coal Co. is making an effort at this place to ascertain if any of its 13 barges which went down in the storm of Sept. 29 can be raised and salvaged. Lines have been attached to one of the pump boats which sunk, and it is thought that it may be recovered, but the fate of the other pump boats and barges is problematical as yet.

Columbus, Ohio—The first of a number of suits of the New York Coal Co. against the Sunday Creek Coal Co. for royalty on leases of Ohio coal lands was recently decided in favor of the plaintiff. The jury returned a verdict for $4536 and interest against the Sunday Creek Coal Co. for leased land at Orbinton, Hocking County. The royalty is 7½ cents a ton for all coal mined.

Pittston, Penn.—With the hope of securing the $5000 bonus offered in its contract for the completion of the Ewen breaker, of the Pennsylvania Coal Co., replacing the structure burned last winter, by Jan. 1, 1915, the contracting company is redoubling its activity. The breaker is to be of concrete and steel entirely and will be absolutely fireproof. The framework is largely up.

Whitesburg, Ky.—A transportation of about 100 laborers, mostly foreigners, arrived in Fleming recently to be employed by the Elkhorn Mining Corporation. Other increases and extensions are promised by the company in its different plants in order to fill large orders which are now on hand for future delivery. Mining activities are daily increasing in the eastern Kentucky field.

Charleston, W. Va.—Operators of southern West Virginia state that large amounts of coal have been ordered by the French Government from producers along the Chesapeake & Ohio and Norfolk & Western railroads, and that the time limit for delivery is six months. One company alone is said to have accepted an order for 600,000 tons, and it is said that this order is the smallest of many.

Chicago, Ill.—Both the Knox County operators and those of the Clinton field have perfected sales organizations something along the lines of the Franklin County, Illinois system. The Knox County operators intend to conduct an educational campaign designed to teach the public how to obtain the best results from their coals, and are looking for an efficiency engineer to take charge of this work.

Wilkes-Barre, Penn.—The Nordberg Mfg. Co., of Milwaukee, Wis., recently received an order for two steam and two electric mine hoists from the Lehigh & Wilkes-Barre Coal Co. The Nordberg company has in the past constructed hoists mostly for large metal mines of the Lake Superior and Western districts, although in a few cases hoists have been built for coal mines. The steam hoists in this order will be among the largest and most complete in the anthracite region.

Wilmington, Del.—The property and business of the E. I. du Pont de Nemours Powder Co., of New Jersey, was recently sold and transferred to E. I. du Pont de Nemours & Co., of Delaware, which corporation was organized for the purpose of taking over and carrying on the business. The new firm assumes all liabilities of the old company except capital stock and sundry debts, and will carry out all contracts of the old firm, there being no change in the personnel of the management, operation, or methods of handling business. The capital stock of the new corporation amounts to $120,000,000.

New York, N. Y. — Charging that the Delaware, Lackawanna & Western R.R. has failed to collect demurrage on barges detained at the New York Lighterage station the Federal Grand Jury has returned 20 true bills against the company for failure to apply the rules of the published tariffs as approved by the Interstate Commerce Commission, and which the Government will endeavor to prove is a violation of the Elkins law. The indictments were brought on offenses alleged to have been committed on shipments of anthracite coal from Pennsylvania to New York from October, 1912, to October, 1914.

Superior, Wis.—Negotiations for the leasing of the Sunday Creek Coal Co.'s dock to the Lehigh Valley Coal Sales Co. have been concluded, and Superintendent Emil Emmert recently took charge of the dock on behalf of the Lehigh interests. Only that portion of the dock which has been used for handling and storing anthracite will be utilized by the Lehigh firm, and it is said that the terms under which the dock has been leased are virtually a contract, whereby the Sunday Creek company handles anthracite for the Lehigh firm during the coming winter. The contract only runs until next spring.

Toronto, Ont.—Thomas Richardson M. P., of Whitehead, England, representing the English coal miners' unions and Richard Baird, a representative of the British colliery owners, are in Canada on their way to the Pacific Coast. There are upwards of 3000 British Columbia miners out of work and the unions there communicated with the English unions asking if these men could be taken to England and employed in the coal mines there. A large proportion of the British Columbia miners are from the British mining districts, and it is anticipated that Messrs. Baird and Richardson will take back many of them to their native localities.

Pittston, Penn.—With an avalanche of orders that poured in with the first frost and heavy shipments for storage purposes, the coal mines of the Upper Anthracite field are working steadily, after a summer of spasmodic operations. The effect is apparent in the action of the railroads in calling on crews and extra men who were practically idle during the warm months. For weeks steadily, the Lehigh Valley has been stocking freshly mined anthracite at the rate of 125 cars per day in its storage plant above Coxton Yards and reports of heavy storage are being received from other roads traversing this district. There is furthermore a heavy demand for steam sizes, indicating that other industries are piling up anthracite for commercial uses.

Coal Trade Reviews

General Review

Anthracite distribution at record rate for the season and prices stiffer. Growing labor and car shortages the features of the bituminous situation. Spectacular advance in vessel rates restricts exports. Consumption in iron and steel lines at maximum rate.

Anthracite—Prices have materially stiffened, and while individuals are still occasionally offering slight concessions, the large companies are slowly but surely getting the situation well in hand. Distribution is at the record rate for the season to date. Shortages of certain kinds of equipment have been reported in the mining regions, and some of the companies have already been forced to draw on their storage supplies. Thick weather along the coast has effected shipments to down East ports, and some anxiety is developing at points where navigation closes in November. The outlook is for a favorable business throughout the balance of the year.

Bituminous—There is no particular snap to the trade, but the market is steady and firm. Determination on the part of the agencies to realize better prices, supported by the decidedly favorable turn to general business conditions, are more responsible for the improved situation than any insistent demand. Very slight price advances are noted on certain grades that railroads are stocking heavily. Agencies generally have fair orders on hand, particularly for shipment all-rail. Labor and car shortage continue the leading features of interest. Attractive wage offers in other lines, such as the steel industry, are drawing men away from the mining regions, while shortage in transportation facilities is crippling mine operations seriously. The market is sensitive and will respond quickly to any interruption in operations or sharp increase in demand.

Exports—Vessel rates on coal fixtures to Italian ports are at a prohibitive level and no charters for that country have benn announced during the past week for the first time in a long period. The situation in this respect is general all over the world as is evidenced by the sharp advance in English rates following the withdrawal of Greek vessels from British shipping; remarkable high freights are being reported from England to South American ports. The export movement in consequence, is light from all American ports, but it is clear that the relapse is regarded as only temporary; the generally feverish interest is still noted in export circles and the larger companies continue sending representatives abroad.

Lake Trade—Coal çonsumption in iron and steel lines is running easily ahead of all previous records. Cooler weather has also given a mild impetus to domestic trade while the railroads are consuming a larger tonnage and putting some coal into storage. It is evident that there is less pressure to sell consignment coal while renewal of orders are more frequent. The car situation grows more ominous as the season advances; some roads have even announced that only 75% capacity allotment will be made for the time being, and the shortage is spreading to all parts of the country. The vessel situation for shipment up the Lakes is also becoming acute. Every effort is being concentrated on getting all the ore down the Lakes possible, and vessel owners are showing a disposition to abrogate contracts with coal shippers rather than lose time loading and discharging coal.

Middle Western—Lower temperatures have brought a real snap to the domestic business, and there has been a general broadening of the demand in all directions. Rail shipments out from the upper Lake ports have been the largest of the season to date. The demand is heavy enough to stiffen prices, and still further advances are anticipated in the very near future. Some operators are reporting unfilled orders on hand. The reaction following the increase in freight rates to the Northwest has been scarcely preceptible. Mines are slowly getting under full operation, or as full as the restricted car supply will permit.

A Year Ago—Anthracite steady but lacking the customary snap at this time. Bituminous continues to drag and the export business is scarcely above normal. All markets are much dependent on colder weather. Lake shipping is somewhat better.

BUSINESS OPINIONS

Boston News Bureau—So far as one can see the only real danger in the situation lies in over confidence. Everything that goes to make up a perfect condition of affairs seems to be with us. The products of the soil, the representatives of real wealth, are all that we could wish, and in view of the prospective demands of the world, are of more importance this year than ever before. As a nation we are in a position to take advantage of all our opportunities, and we are prepared to do so. We never knew our abilities because we were never put to the test before. The whole world today recognizes our power, financially and commercially. Our profits from the European war are accumulating and are giving us more courage in new undertakings. This is beginning to show already, and the outlook is for a tremendous growth in this direction. It is difficult to set the limit for this onward push. General business sentiment is steadily growing stronger, because people can begin to see definite signs of the improvement.

Iron Age—The volume of current business for 1916 delivery is not as great as might be expected with steel as scarce as it is and with the expectation general that this tightness will continue for months. Few mills are making any effort to sell for any part of next year, but the Steel Corporation's gain of 400,000 tons in unfilled orders is taken to mean that it has done more selling for the first half than its competitors. Some of the steel companies are holding off because they are well sold up for several months and look for higher prices. Apparently buyers for European governments have failed to appreciate the rate at which the mills have been filling up. France has held back large requirements for the first half of next year which must soon be placed. Italy has been asking for barb wire, plates, billets and bars running up to 100,000 tons and has encountered rising prices on all sides.

American Wool and Cotton Reporter—Improvement in the wool market continues. Fundamental conditions point toward great strength for considerable time ahead. Inquiries are being made indicating that manufacturers will buy more before long. Dealers have recovered from their worry over the removal of the embargo on crossbreds. The foreign markets are strong. The woolen goods market is in a generally satisfactory position and a rather radical improvement is looked for during the next few weeks. The outlook is more favorable in cotton goods and the prospect for still greater activity exists.

Dun—Current trade reports reflect the best conditions and prospects in many weeks, few obstacles to progress now being in evidence. Removal of important restraining influences imparts needed stimulus to new enterprise, and launching of many deferred undertakings attests the widespread confidence. While labor controversies are a drawback in some directions, notably in the East, troubles of this nature are usually adjusted before serious losses are sustained either by employers or wage earners. Broadly considered, the mercantile situation is steadily approaching a state of normal activity.

Southern Lumberman—Tangible and definite improvement of a character most gratifying to manufacturers and dealers alike is revealed in reports on the yellow pine market. Latest statistical reports made to the officers of the Southern Pine Association show the balance of orders on hand at 137 mills for the week ending Friday, Oct. 1, to be nearly 20,000,000 ft. in excess of unfilled orders at the same mills at the end of the previous week. While improvement in the hardwood market is not so marked, it is nevertheless becoming more general as the fall season advances. The betterment is slow, but is now recognized by shortage of stocks that are frequently inquired for.

Bradstreet—In the economic situation performance follows promise at a rapid pace, and as unfavorable factors are eliminated, even lagging lines are brought in touch with the circle of growing activity. Industry shows notable activity. Shipyards are working at top speed, eight of the country's crops are of record proportions, this week's bank clearings reached peak point, textile mills are on full time, but the advance in cotton as well as the burdensome price of dyestuffs reduces profits. Building values for September show a sharp gain over last year, our relations to international political affairs are seemingly more reassuring than at any time since the European war started, and almost everywhere in the country optimism is rife.

Marshall Field & Co.—The dry goods business of the week has responded to the seasonable weather by an increase in wholesale shipments and more customers have been in the market than during the same period a year ago. The low stocks that retailers are carrying makes wholesale distribution a very sensitive barometer of the current dry goods business throughout the country. Collections show some improvement over those of the corresponding week last year. The cotton market continues firm with strong upward tendency.

ATLANTIC SEABOARD

BOSTON

Prices are generally firm on Pocahontas and New River, but market rather sluggish. Georges Creek steady, and only slight improvement on Pennsylvania grades. Water freights unchanged. Anthracite demand brisk.

Bituminous—The trend of prices on Pocahontas and New River is steady and firm, although occasionally inducements are made by various shippers to move accumulations. There is no snap to the market as yet; it is a situation that comes more from the determination of the operators to net better prices than any very insistent demand for coal. A week of fair weather causes things to look quiet again. Off-shore inquiry is also a little lighter, although the lull in that direction is considered only temporary.

Very little buying has developed in the past week. There are a few consumers who must place orders during October but there is apparently no haste on their part. Recent circularizing of prices on cars for delivery after Apr. 1 next have had some thing to do with this lack of interest among buyers. Arrivals are about normal, but practically all the coal received is on contracts. Perhaps less coal is available for spot sale than for a month past, but seasonable weather would be a great boon to this market.

Of Georges Creek there are ample supplies at all the loading ports. The demand is quiet but very nearly a normal tonnage is being received here on contracts. Export trade has also eased up somewhat on this grade.

The Pennsylvania coals are in somewhat better position than in July and August, rumors of the shortage helping to induce consumers to take on extra tonnages. All-rail there has been better business on this account, but after a month or so it will need some other factor to give any spurt to the trade. Prices are slightly firmer for spot coal but only on the better grades.

Water Freights maintain the level reached a week ago, 80c. continuing the rate to Boston from Hampton Roads on 3000 tons upward. From New York ports to Providence and New Bedford rates are firm at 45c.

Anthracite—The wholesale demand is brisking up and with some of the shippers there is now more or less delay. All the domestic sizes, not excepting chestnut, are in good request and in most cases there is a marked shortage of steam sizes. The retail trade continues active and the outlook is favorable for the balance of 1915. The prolonged thick weather along the coast has affected shipments to quite a degree, and at points where navigation may close the last of November there is beginning to be some anxiety over getting forward the usual quota.

Bituminous quotations, f.o.b. loading piers at ports designated, are about as follows per gross ton:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields	$2.15@2.65	$2.45@2.95	....	$0.90@1.40
Cambrias and Somersets	2.40@2.90	2.70@3.20	....	1.15@1.65
Georges Creek	2.92@3.02	3.22@3.32	$2.85@2.95	1.67@1.77

Pocahontas and New River prices, on cars Boston, are $3.55@3.73, Providence, $3.50@3.68, and f.o.b. loading port at Hampton Roads, $2.80@2.85.

NEW YORK

Cool weather forcing out anthracite orders. Individual prices close to circular. Bituminous shares in the improvement. Labor and car shortages developing.

Anthracite—The anthracite trade is showing gradual improvement. The weather has been mild, but still cool enough to make fires necessary and a good deal of coal has been going into consumption. Consequently retail dealers have been in the wholesale market, and distribution in all lines of trade is now on a larger scale than since the early days of spring. Most operations are now working full time, with labor in the regions growing scarce.

With the demand showing so much improvement, there is but little individual coal now being offered off the circular. Chestnut coal is active in all directions, line shipments of this size taking care of the entire output of some of the individual operators. At Tidewater, it has strengthened materially the decrease in shipments having brought about an excellent demand for rail deliveries. Stove continues in good demand, with egg the weakest of the prepared sizes.

The buckwheats are in good call, with the supply of free coals diminishing. Some of the large companies are finding fresh mined supplies inadequate to take care of orders, and are quoting purchasers on storage stocks. Prices in practically all instances on the steam sizes are up to the full circular, with only the lowest grades offering at concessions, which have grown relatively small.

Current quotations, gross tons, f.o.b. New York tidewater, are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual

Rice	2.25	1.85@2.20	2.30	2.00@2.30
Barley	1.75	1.50@1.75	1.80	1.25@1.80

Bituminous — The tidewater bituminous situation shows more strength though prices on spot coals are not materially altered. Shippers are trying to impress the buyers with the fact that car shortages are already growing serious, and that production is being crippled thereby, but the result of this campaign has so far failed to create much of an impression in-so-far as spot prices at Tidewater ports are concerned. Prices at the mines are on a higher scale than the Tidewater quotations would indicate. This has resulted in a scaling down of shipments of unsold coal to tide to await prospective buyers, as operators are finding it possible to move coal now, at fair prices, to all rail consumers.

Labor shortage is materially restricting production. Miners are becoming scarcer as the steel and other industries increase their activities and bid against the operators for men. With most of the companies having a good portion of their output tied up until April first, they are not in position to hold out when it comes to paying workmen an increase that they cannot pass on to their customers.

Coke industry is very active and absorbing a lot of coal that would go into the steam trade ordinarily. Export shipments are showing a slump because of the tightened situation in ocean freight rates. Bunker trade is heavy.

Current quotations New York tidewater, per gross ton, are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85

PHILADELPHIA

Anthracite has good week. Price stiffening. Stove leads, with chestnut fair and egg dull. Pea still the source of trouble. Collections shaping up well. Bituminous trade fair, with poor car supply causing trouble. Prices generally stationary.

Anthracite—Business has improved, but it is possible that of the individuals has suffered to some extent. The shippers prices have undoubtedly stiffened and while the big companies are adhering to circular the individuals occasionally take an even chance for the trade. Considerable business has been lost to the largest shippers by the individuals dropping the state tax. However, the large companies are rapidly coming into control as they usually do at this time of the year.

It has been an active week and the retailers have actually been busy. If it were not for the regrettable and apparently inexcusable price war in certain sections of the city, the business would have a fine start for the retail men as they go into the first of the six months of activity that looms before, to which they all have been looking forward so long and which the shippers especially predict are bound to be exceptionally active.

Pea is quite a problem just now; it is in strong demand at $2, usually with the tax, but it is not moving as rapidly as expected. Sales of this size should be very heavy at this time, especially this year when conditions are so very unusual. Shippers strongly hint that prices will advance. It is just possible that the large buyers are protected in a quiet way at the $2 price until the first of the year and this is leading the small buyer, who is not carrying capacity stocks by any means. Considerable "jockeying" of prices on this size is noted which may eventually result in quotations not getting any higher for some months to come.

It is the logical season to buy, before freezing weather comes making the preparation of all coal more or less uncertain and also difficult to unload. Yet despite these reasons there is no unusual demand, all orders being filled, and this is difficult to understand in face of the fact that the retail men are busy and most of the coal going out of their yards is pea size.

Chestnut is improving but it can still be bought at less than circular and the price usually varies with the size of the order. Stove maintains its position as the leader and the circular is firmly maintained. Egg is hard to move, with the individuals who are understood to have considerable on demurrage at the collieries. Buckwheat continues active and the supply of this size will probably be shorter as the season advances. Rice is plentiful and there have been a number of instances where it has been offered at 20 to 25c. off circular, but with very little success.

The short car supply has forced several collieries to shut down due in part to the lack of certain kinds of equipment.

Collections are better than for some time as dealers realize that when the rush begins the delinquents will have to take second choice. Movement of anthracite to Tide points continues good.

Quotations, exclusive of the Pennsylvania State tax of 2½%, per gross ton f.o.b. cars mines and at Port Richmond are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.25	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—Most shippers have good orders in hand but there is no rush. A peculiar situation prevails in that the car supply is short without any concurrent briskness in the coal trade. Prices have not varied much with the exception of Fairmont coal; railroads have begun to accumulate stocks of this grade and the increased demand has advanced the price an average of 5c. per ton. There seems to be something of a lull in the export trade, but this is regarded as only temporary. Quite a number of local mining interests have representatives abroad, and this week still another of the large companies sent an agent to France.

Average prices per gross ton prevailing in this market are as follows:

Georges Creek Big Vein	$1.70@1.80	Fairmont gas, ¾	$1.25@1.35
South Fork Miller Vein	1.55@1.65	Fairmont gas, mine-run	1.10@1.20
Clearfield (ordinary)	1.15@1.25	Fairmont gas, slack	.75@ .85
Somerset (ordinary)	1.10@1.20	Fairmont lump, ordinary	1.05@1.15
West Va. Freeport	.95@1.05	Fairmont mine-run	.95@1.00
		Fairmont slack	.70@ .80

HAMPTON ROADS

Movement slows down appreciably. Foreign shipments mostly to Italy. Normal accumulation at Tidewater.

The movement of coal from Hampton Roads ports during the week has not been as heavy as anticipated. both coastwise and foreign shipments being somewhat light. Export cargoes were principally to Italy going to Reggio, Genoa, Civita Vecchia, Naples, and Taranto. Coastwise shipments have been made to the New England market and have consisted principally of run-of-mine Pocahontas and New River although there has been some movement of high volatile.

The demand in both the home and European market has been light all week and so far as can be ascertained no large sales have been made for prompt movement. The accumulation of coal on the railroad yards is around normal with a fair supply in the storage plant at Sewall Point. Coal is constantly being dumped into this storage plant but some has been reloaded for shipment and it is difficult to ascertain what quantity is actually on hand.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

	Week Ending				
Railroad	Sept. 11	Sept. 18	Sept. 27	Oct. 2	Oct. 9
Norfolk & Western	156,459	182,047	163,400	131,055	140,934
Chesapeake & Ohio	93,260	87,686	91,341	72,996	93,344
Virginian	70,855	59,597	79,176	59,997	65,150
Totals	320,574	329,330	333,917	264,048	299,428

OCEAN FREIGHTS

A large number of steamers for export coal were chartered during the past week. The last charters for grain to Italian ports were at $15.84 and shippers are endeavoring to secure concessions in this rate, but thus far without success. There have been no charters for Italian coal since our last report, as shippers are not inclined to meet owners' views. Coal rates to Brazil and to the Plate are very firm, and it is reported that a steamer has been chartered to load coal at Virginia for Rio at $9.60, though there are steamers willing to accept a lower figure. We understand that some remarkably high rates have been paid from Cardiff to the Plate. West Indian freights are firm and advancing.

Coal freights are quotable as follows:

To	Rate	To	Rate
Havana	$2.50@3.00	Bermuda	$3.00@ 3.25
Cardenas or Sagua	2.75@3.25	Vera Cruz	5.50
Cienfuegos	3.00@3.50	Tampico	6.50
Port au Spain, Trinidad	3.75@4.00	Rio	8.64@ 9.12
St. Lucia	3.50@3.75	Santos	8.64@ 9.12
St. Thomas	3.25@3.50	Montevideo	8.64@ 9.60
Barbados	3.75@4.00	Buenos Aires or La Plata	8.88@ 9.60
Kingston	3.00@3.25	Rosario	9.12@10.08
Curacao	3.25@3.50	West Coast of Italy	13.20@14.40
Santiago	3.25@3.50	Barcelona	11.52@13.20
Guantanamo	3.25@3.50	Valparaiso or Callao	7.50
Demerara	6.00@6.50	Marseilles	12.00@13.20

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Demand improved on the whole, with iron and steel industry taking record tonnage. Operations 60 to 70% of capacity. Car shortages more pronounced. Prices slightly stiffer.

There is an improved line demand, with the steel industry taking still larger tonnages than formerly, and easily making a new high record rate for coal consumption. The railroads are all busy and are consuming more coal, and are also stocking a little. Domestic demand remains relatively light but is approximately normal for the season.

Car shortages have developed on additional lines and in some cases are rather serious. Cars in themselves are not plentiful and with some apparent shortages in motive power the movement is not good. The general expectation is that there will be a severe car shortage before the close of Lake navigation. Shipments in the Lake trade continue moderate. Coal cargoes are not being eagerly solicited, as strenuous efforts are now being made to move every ton of ore possible down the Lakes before the close of navigation and many boats are going up light.

Mine operations in the Pittsburgh district continue at between 60 and 70% of capacity, probably somewhat nearer the higher figure. Prices for free coal have stiffened slightly, and while the former minima can sometimes be done, advances of 5c. are not uncommonly paid. Youghiogheny gas slack is in particular demand, at fully 60c. We quote free coal: Slack, 50@60c.; nut and slack, 90c.@$1; nut, $1@1.05; mine-run, $1.05@1.10; ¾-in., $1.15@1.20; 1¼-in., $1.25; on contract to Apr. 1: slack, 85@95c.; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

TORONTO

Coal moving more freely and there are indications of a turn for the better.

Coal has been moving more freely with the setting in of cooler weather, and the industrial outlook is showing some indications of improvement. Yards are kept well stocked against a possible shortage and dealers are advising consumers to lay in good supplies in advance, though so far comparatively few are doing so. Transportation is somewhat delayed by a shortage in cars. Steel hopper cars are about 25% short of the demand, while the gondola flat cars are unobtainable. Higher prices on all grades of soft coal are anticipated and a local advance in wholesale bituminous rates has been made.

Quotations per short ton for best grades are as follows: Retail, anthracite egg, stove and nut, $7.75; grate, $7.50; pea, $6.50. Bituminous, retail steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $8. Wholesale, f.o.b. cars at destination, three-quarter lump, $3.79; screenings, $3.

BUFFALO

Steady improvement in bituminous, though the rush is confined chiefly to the Pittsburgh market. Buffalo is handicapped by the slow Canadian demand. Anthracite moving faster.

Bituminous—This market feels the general stir of business, but it is not able to come up to the level of Pittsburgh, from which some very extravagant reports are coming at present. Buffalo depends largely on the Canadian trade, which is still light and does not promise to improve much right away. The car situation is getting worse; shippers are receiving notices that they will not be furnished with more than 75% supply. The mines are also warned to send out loaded cars promptly; if any are found loaded they are now counted as part of the allotment of the day.

While the shippers still report the bituminous market as somewhat unsteady it is agreed that it improves every week. Quotations are more firm than formerly and somewhat higher on some sizes as follows:

	Pittsburgh	Allegheny Valley	Penn. Smokeless
Lump	$2.65	$2.45	$2.55
Three-quarter	2.55	2.30	....
Mine-run	2.45	2.20	2.30
Slack	2.15	2.05	2.30

These quotations are f.o.b., Buffalo freight rates, and are for short tons to all points except east of Rochester, N. Y., and Kingston, Ont., where the long ton basis prevails.

Anthracite—There is some stir in this market, but the consumer is not at all anxious for coal yet. Favorable reports come in from the Western trade, which is waking up to the fact that winter will soon be here. The shippers to Lake Michigan will soon find that they must pay higher Lake freights if they are to get much tonnage. All the vessels now want to go to Lake Superior after the 6c. wheat freights. Even small steamers are refusing coal and going light for wheat.

The local trade has not started up much yet. The anthracite mines show increased activity. The stocking of surplus is not very general. All sellers of independent anthracite report that trade is picking up and prices are fully up to circular. Bituminous jobbers in this branch of the business are active and appear to be pushing sales in a way that the agents and salesmen of the large companies are not.

Prices of anthracite at Buffalo are per long ton, $5.60 for grate, $5.85 for egg and stove, $6.10 for chestnut and $4.30 for pea, all f.o.b. For delivery to vessels an addition of 25c. per ton is made. Prices include the Pennsylvania state tax.

COLUMBUS

Improvement in the domestic trade. Prices well maintained and some talk of an advance.

Dealers are buying better since weather conditions have improved and more orders are now released. There is a generally better tone to the market and it is believed that the worst of the depression is over.

Retailers' stocks are not large and since they are having a good demand from consumers they are compelled to replenish their stocks. Most of the orders booked at this time are for immediate shipment. A number of the producers and jobbers have instructed their salesmen not to book orders at present prices beyond Oct. 15. In case an advance is made it will be on an average of 10c. on the ton.

There is a better market for the small sizes. Nut, pea and slack is especially strong and prices are advancing. In retail circles there is a good demand for the fancy grades, such as Pocahontas and West Virginia varieties. Hocking lump is now being stocked to a larger extent than formerly. Considerable attention is being given to school, public institution and municipal contracts. A number of Ohio institutions have announced that nothing but Ohio-mined coal would be bought.

Lake trade is rather quiet, although there is a fair tonnage being shipped, though a part of this is from West Virginia mines.

Steam business is strong in every department. Manufacturing is still on the upturn and as a result fuel requirements are increasing. Railroads are still storing an immense quantity of coal for the winter. Car shortage is growing more pronounced in many sections, especially on the Chesapeake & Ohio R.R. and is extending to other roads.

Prices in Ohio fields per short ton, f.o.b. mines, are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.50	$1.60		
Inch and a quarter	1.40	1.45	$1.30	$1.30
Three-quarter inch	1.25	1.35		1.25
Nut	1.15	1.25		1.15
Mine-run	1.05	1.10	1.00	1.05
Nut, pea and slack	.65	.65	.50	.55
Coarse slack	.55	.55	.40	.45

Mines have been working at about the following precentages of full capacity:

	Week Ended			
District	Sept. 18	Sept. 25	Oct. 2	Oct. 9
Hocking	45	50	50	50
Jackson	25	25	25	30
Pomeroy	60	75	80	75
Crooksville	40	40	40	45

	Week Ended			
District	Sept. 18	Sept. 25	Oct. 2	Oct. 9
Cambridge	45	45	45	50
Massillon	45	45	45	55
Eastern O.	70	75	80	80
Average	47	50	52	55

CLEVELAND

Cooler weather braces domestic trade, but jobbing business remains unchanged. Scarcity of vessel tonnage.

Receipts were fair over Sunday, but there was no inquiry for coal. Jobbers held the prices because they cannot otherwise come out whole, but sales were made with an effort. Cold weather the last week has given the domestic trade an impetus. So much of the domestic business is hand to mouth, especially this year, that the weather has an unusual effect upon it.

The lake situation does not change. Some of the shippers are having trouble getting boats and have notified some of the vessel owners they must live up to contracts or vessels will be chartered in the open market to their accounts. This is rather extreme, but such a threat seems to be necessary to make some managers realize they have coal to carry. Freight rates higher than the contract rates of last spring have been paid to smaller ports. The larger shippers will not pay anything extra until the last two weeks of the season.

Jobbers are being quoted at the following prices, f.o.b. Cleveland per short ton:

	Pocahontas	Youghiogheny	Fairmont	Bergholz	Ohio No. 8
Freight rate	$1.45	$1.00	$1.15	$0.70	$0.90
Lump	3.70				
Lump, 6-in.				2.30	
Lump, 1¼-in.		2.40		2.10	2.15
Lump, ¾-in.		2.30	2.05	2.00	1.95
Egg	3.70				
Egg, 6-in				1.90	
Mine run	2.80	2.15	1.95	1.85@1.90	1.85
Slack		1.75@1.80	1.85	1.65	1.70

DETROIT

Greater regularity develops in steam trade. Cold weather strengthens market for domestic coal. Lake movement of small volume.

Bituminous—Small sized orders and more renewals give an encouraging aspect to the steam trade. While the total amount of business is less than normal for this period a gradual improvement is expected from now on. Consignment coal is still plentiful but forced sales has greatly diminished and cheap offerings are few. Weather conditions are creating a greater demand for domestic coal. Retail yards seem to have considerable of a supply on hand, but renewal orders are expected soon.

Anthracite—Distribution of anthracite to consumers is making good headway, some retail yards finding it necessary to put additional men and teams at work. Though somewhat delayed, the outlook is for normal sales. Some difficulties and delays are reported in transportation.

Lake Trade—Attractive freight rates on grain and iron ore leaves few Lake freighters available for handling coal. From the present outlook, much coal will have to be shipped all rail into the Northwest.

TOLEDO

Car problem more serious. Lake movement continues light.

The traffic situation is commencing to look more serious than a few weeks ago and the local trade is finding it more difficult to secure quick shipments. Indications are that this tightening will be more and more noticeable as the grain shipments increase. The Lake movement is light although quite a bit of coal is coming into the Toledo docks. The domestic trade has been strengthened recently by the cold weather.

Quotations here, f.o.b. mine, per short ton, are:

	Pocahontas	West Virginia	Hocking	Pomeroy	Jackson	Massilon	Kentucky	Pittsburgh No. 8
Lump	$2.25	$1.40@1.85	$1.60	$1.65	$2.50	$2.50	$1.75	$1.25
Egg	2.25	1.00@1.25	....	....	....	....	1.25	1.20
Mine-run	1.40	.85@1.00	1.10	1.10	2.50	....	.90@1.10	1.00
Nut	....	.90@1.15	1.25	1.25	....	2.50	.90@1.15	.....
Nut, pea and slack	....	....	.65	.65	.60	....	.40@ .60	.60@.75

CINCINNATI

Colder weather has stimulated the market and both orders and inquiries are more numerous. Shortest car supply of the season is hampering deliveries.

A touch of winter with a trace of snow, helped to bring all classes of consumers of coal to a realization that fuel will soon be required, and the retail trade promises to be livelier from now on. The steam trade is still lagging somewhat, due to relative inactivity in many manufacturing lines rather than to disinclination to buy. Larger industrial consumers have contracted for their requirements, and while deliveries have been held off, indications are that they will be required from now on in normal quantities.

The chief trouble with operators just now is in the short car supply, conditions on one or two lines last week being the worst of the season. Cars were almost entirely lacking, and coming at a time when orders are picking up for the first time in a seasonable fashion, the shortage was especially irritating. Prices as a rule are firm, although there is some cheap coal being offered here and there.

LOUISVILLE

Car shortage limiting outputs and retailers beginning to consider their stocks.

Retail dealers, as a rule, have not been buying as much as usual. The car shortage is limiting the outputs of most of the mines and the thoughtful retailers are taking this into consideration. The movement generally has been somewhat better during the past week and prospects are good.

Prices per long ton basis, f.o.b. mines, are around $1.75 for Eastern Kentucky block and $1.15 for the Western Kentucky lump; nut and slack in Eastern Kentuckies sell at from 50 to 65c. for the best grades, with the lower grades on almost a level with Western Kentucky pea and slack, on which the buyers are about making their own prices.

COKE

CONNELLSVILLE

Furnace coke contracting movement continues, with 125,000 tons monthly closed thus far. Slightly lower prices for year than for half-year. Spot coke stiffer. Production and shipments slightly increased.

Additional contracts for furnace coke for 1916 have been closed. Typical transactions are 10,000 tons a month over 1916 at a sliding scale, with 20% as much advance in coke as in basic pig iron, valley, making coke $2.15 at the present market of $15, $2.35 on $16 pig iron and so on, and a contract for about 18,000 tons a month over 1916 at a flat price of about $2.25. Coke contracts placed thus far in this movement, covering four or five weeks, total about 125,000 tons a month, partly for the first-half and partly for the whole year. Sliding scale contracts are made on the same basis whether for the long or short period, while in the case of flat prices slightly lower figures are quoted for the whole year than the half-year. Operators are doubtful whether the coke market will be as strong in the second-half as the first-half as so many byproduct ovens are to be completed by next June, and thus the disposition is to quote a shade lower for the longer delivery.

Prompt furnace coke has advanced again. There were no sales last week to speak of, with practically no offerings and no urgent inquiry. This week opened with quotations higher on the strength of there being no accumulations, rather than on the basis of heavier demand. Foundry coke demand is moderate. We now quote: Furnace coke, prompt, $1.85@1.90; November and December, $2; first-half, $2.35@2.50; year 1916, $2.25@2.35; prompt foundry, $2.30@2.60; contract foundry, $2.40@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 2 at 397,589 tons, an increase of 8,705 tons, and shipments at 395,243 tons, an increase of 8,225 tons.

Buffalo—There is an effort on the part of producers to make a sharp advance in the price of coke and quite a large part of them have withdrawn all quotations, after asking about $4.40 for foundry. Jobbers are doubtful about it and are not inclined to pay the advance, maintaining that $4.40 is sufficient for best Connellsville 72-hr. foundry, with stock coke $3.45.

Chicago—The Chicago coke market continues to harden. Connellsville quotations are higher. The demand for byproduct foundry has been very strong, and a better tone is seen in gas-house. Increased orders have been received for byproduct domestic sizes. Prices f.o.b. cars Chicago per net ton of 2,000 lb. are as follows: Byproduct foundry, $4.90@5.10; byproduct domestic, $4.85@4.95; Connellsville, $4.85@5; Wise County, $4.85@5; gas coke, $3.90@4.

MIDDLE WESTERN

GENERAL REVIEW

Chilly weather makes improvement more marked. Domestic business snappy. Steam coals stronger. Anthracite demand expanding.

The past week has been characterized by a steady and broadening demand in all branches of trade. With temperatures below normal for this time of year, the close of last week has seen a real snap to domestic business and more active buying at firm prices. Wholesalers report orders increasing day by day, and are very cheerful over the outlook. The forward movement in retail buying has been conspicuous, and is welcomed by local yards. A number of operators report unfilled orders on hand for domestic coals and certain other sizes, which augers well for the future now that chilly weather has appeared.

Increased demand has led to some stiffening of prices, particularly Indiana and Springfield domestic sizes; No. 2 Franklin County nut is being sold at higher figures and Southern Illinois No. 1 washed is in strong demand at firm prices. The advance in freight rates on some Western coals has slowed up orders slightly, but no particularly harmful effects have been noticed as yet. Screenings occupy about the same position as last week. A considerable volume of coal is still moving to Northwestern points notwithstanding the rate advances. Rush orders have been received from many interior points owing to frosty weather. The price situation is generally strong, and in this respect Eastern coals have benefited greatly.

CHICAGO

Domestic trade very strong. More operations resuming production. Car shortage developing a scarcity of Eastern coals. Railroads continue heavy buyers. Anthracite picking up rapidly.

Franklin and Williamson County coals remain stationary in price, but it is expected that an advance will occur about the middle of the month. Egg is moving better and steam sizes are held up remarkably well. Lump and No. 1 nut are held firmly at $1.75, and screenings are slightly stronger, averaging about 55c. The mines are averaging from four to five days per week in running time.

The domestic demand for Springfield coal has improved considerably, and orders during the last week have been in large volume; $1.75 is the ruling figure for domestic lump. Screenings are showing more activity at higher prices, and average 50c.

A heavier demand for Indiana domestic coal this week has been a prominent feature. Steam coals are not so strong but are improving; screenings, however, are well maintained in price. Operators are preparing for a month of great activity, and are making special efforts to keep retailers fully supplied. Some of the larger Indiana mines which have not yet resumed operations are expected to begin hoisting coal very shortly. No. 4 screenings are selling around 70c. a ton, with Nos. 5 and 6 about 10c. lower; retailers generally have advanced the price of all domestic coals 25c. per ton.

Pennsylvania smokeless shipments are light because of car shortages. The colder weather has created active distribution of smokeless coals while the dealers' supplies are beginning to melt away, and their orders have been more frequent and urgent; there is no free coal here at the present time. The situation in smokeless is more satisfactory than for several weeks past; prices are stiffer and very little lump and egg is being sold under $2.10. Prices are stronger for splint; the better grades are selling at $1.50, and high grade nut and slack has gone into northern Indiana at from 60c. to 65c. Manufacturing is gradually becoming stronger, and the splint operators think that fine coal will be at a much higher level within a short time.

The Hocking circular will probably advance shortly because of the firm domestic demand and active buying for stocking purposes. Hocking lump is being stocked heavily and railroads are continuing to absorb storage coal. Some dealers complain that there is little Hocking coal of better quality available.

The Kentucky situation has bettered with stronger prices for all grades except steam sizes, which are still comparatively slow. Railroads are reported to be taking maximum tonnages from Kentucky mines.

Retail dealers are making more progress with anthracite deliveries, and there is lately a better tone generally in this branch. It is felt that the reports of reduced production at the mines has had some effect in stimulating orders. Prices are about at the same level of last week.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

DULUTH

Shipments out the heaviest of any week this season. Receipts light, some docks receiving no cargoes. Anthracite normal.

The past week has seen the heaviest shipments made by dock companies so far this season. The weather has been wet and cold, so that the retailers witnessed a real spurt and the wholesalers have kept everything moving, in order to take care of the requirements of the domestic trade. Shipments for the railroads are off a little, the wet weather having interfered with the grain movement, shipments of which are reported somewhat delayed. Receipts continue light, a number of the docks not having received a cargo during the past week. No change in prices has been announced since last week and the circular appears to be fairly well maintained, although in a number of instances reports are current that quotations have been made at a little below circular.

Quotations per short ton, f.o.b. cars Duluth, are as follows:

	Yough.	Splint	Hock.	Smokeless	Elkhorn
Lump	$3.40	$3.40	$3.40	$4.75	$3.75
Dock-run	3.10	3.10	3.05	3.25	3.25
Stove or nut	3.40	3.40	3.40	4.75	3.65
Screenings	2.40	2.40	2.25	2.75	2.40

The demand for anthracite for domestic purposes is very good and the shipments continue up to the average of other years. Many householders are now putting in their supply of fuel for the winter and the retail business in this class of trade is quite brisk. Prices f.o.b. cars, docks, per short ton, are as follows: Egg and stove, $6.85; nut, $7.10; pea, $5.55, and buckwheat, $4.

INDIANAPOLIS

Business fairly lively, with better prices for domestic lump and screenings. Retailers busy and have advanced prices. Railroads buying more.

Indiana coal mines are now going at a seasonable pace and the demand for domestic lump is urgent enough to stiffen the price, with sales at $1.50 for 2½-in. and $1.60 for 4-in., both No. 4. The price of screenings has also improved and operators are getting 60 to 65c. f.o.b. mines. Mine-run is selling at $1.15 to $1.20. The mines have just managed to get enough cars to keep coal going to the retailers, who are just now doing a rushing business.

The railroads are also doing better buying and seem to be laying by coal, as far as the supply of cars will permit. The industrial demand continues its slow but gradual improvement. Not all the mines of the state are in operation but the indications are that that condition will exist in November. Retailers have made the second advance in prices this season raising them 25c. on Indiana and Pocahontas coals. The new schedule is:

Linton No. 4 forked	$3.25	Pocahontas forked lump	$6.00
Indiana lump forked	3.00	Pocahontas shoveled lump	5.50
Indiana lump and egg, screened	2.75	Pocahontas mine run	4.50
Kanawha lump, forked	4.25	Pocahontas, nut and slack	3.75
Ohio Hocking, lump	4.25	Anthracite, chestnut	8.25
Ohio Hocking, wash egg	4.50	Anthracite, stove and egg	8.00
Kentucky lump	4.50	Anthracite, grate	7.75
Ohio Jackson lump, forked	5.00	Connellsville coke	6.00
Blossburg smithing	5.50	Indianapolis by-product coke (all sizes)	6.00
Cannel lump	6.00		

ST. LOUIS

Market strengthens up under stimulus of colder weather. Generally good demand and prices up slightly.

The week opened quietly, but the movement was stimulated the latter part by a change in the weather and the market strengthened up considerably. There was a good demand for all sizes except screenings. There was an advance of 5c. on inner group lump grades and on outer group prices there was only a minor change. Screenings were stationary. Country orders for standard grades improved. Still greater improvement in the demand for domestic sizes is expected. There is practically no change in the steam situation.

Quotations f.o.b. mines during the past week have ranged on the following basis per short ton:

	Frk. Co.	Wmsn. Co.	Staunton	Standard
6-in. lump	$1.50@1.75	$1.50@1.75	$1.25@1.35	$1.20
2-in. lump	......	......	1.15@1.20	1.05
3x6 egg	1.35@1.75	1.35@1.65	......	1.00
2x6 egg	......	......	......	.85
No. 1 nut	1.50@1.75	1.50@1.75	......	.80

No. 4 washed	......	1.20	1.05	
No. 5 washed	......	.60@70	.50@60	.....
Screenings	.40@50	.40@50	.35@40	.25

KANSAS CITY

Prices increased. Shipments delayed. Readjustments of freight rates causing some confusion. Outlook encouraging.

Retail prices were increased 25c. a ton on Oct. 1. The rise was somewhat unexpected, though it was generally anticipated that by Nov. 1 prices would be increased 25c. Wholesale prices have advanced irregularly on different kinds, from 10c. to 25c. a ton, some grades not being affected. Wholesale dealers report the demand good and the supply still seriously retarded on account of the recent heavy rains. Railroads are short of cars. On interstate shipments, freight rates are up 10c. and there is some confusion as to what constitutes interstate shipments so that dealers have to refer all freight questions to their traffic departments. Coal men generally are beginning to congratulate themselves on what looks like the beginning of a favorable season.

Ruling prices, per short ton, f.o.b. mines, with freight rate to Kansas City, are:

		Freight			Freight
Cherokee lump	$2.25	$0.90	Farmer's Block (Red Label)	$2.65	$0.60
Cherokee mine run	1.85	.90	Morning Glory (Higginsville)	2.35	.60
Cherokee nut	2.00	.80	Arkansas Semi-Anthracite	3.00	2.10
Cherokee mill	1.60	.75	Arkansas Anthracite sizes	4.10	2.20
Cherokee slack	1.40	.75	Arkansas Anthracite lump	3.85	2.20
Lexington block	2.10	.40	Pennsylvania Anthracite chestnut	7.10	2.60
Parlor block	2.10-2.25	.40	Pennsylvania egg	6.85	2.60
Richmond	2.10	.40	Pennsylvania grate	6.60	2.60
Waverly lump	2.10	.40			
Waverly nut	2.10	.40			
Novinger No. 1 lump	2.10	.60			
Novinger Co. C	2.00	.60			
Novinger nut	1.85	.60			

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

Anthracite shipments for September and the first nine months of 1914-15 were as follows:

	September		9 Months	
	1915	1914	1915	1914
Phila. & Reading	895,718	1,101,296	7,995,805	8,869,552
Lehigh Valley	1,093,283	1,290,327	9,447,463	9,550,799
Cent. R.R. of N.J	626,237	824,604	5,636,799	6,560,049
Del. Lack. & West	820,440	893,098	6,791,191	7,138,223
Del. & Hudson	737,592	647,974	5,970,324	5,354,593
Pennsylvania	467,587	575,898	4,233,909	4,697,325
Erie	718,751	727,950	5,816,660	6,169,528
Ont. & Western	159,163	185,045	1,486,960	1,727,512
	5,518,771	6,246,192	47,379,111	50,067,581

Stocks at Tidewater Sept. 31 were 633,338 tons.

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for May and the preceding three months:

	April		May		June	
State	1914	1915	1914	1915	1914	1915
Missouri	179,723	196,032	165,394	161 575	185,731	166,885
Kansas	378,192	410,565	370 097	354,264	490,561	449,803
Arkansas	87,002	80,118	95,749	71,023	133,350	71,498
Oklahoma	239,443	181,873	241 80	173,821	273,692	201,126
Totals	884,360	868,588	872,421	760,683	1,083,334	889,312

SAULT STE. MARIE CANALS

Anthracite shipments through St. Marie canals in September were: 174,560 short tons of anthracite which is 11,650 tons more than in the same month last year but 126,973 tons less than in September, 1913. Bituminous shipments were 1,553,426 short tons which is 210,166 tons less than during the same month a year ago and 1,503,920 tons less than in September, 1913.

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during August and the past four months in short tons:

	May	June	July	August
Pocahontas Field	1,259,992	1,493,776	1,648,551	1,721,573
Tug River District	322,881	348,737	361,454	337,585
Thacker District	278,775	238,688	265,743	227,312
Kenova District	90,642	81,794	80,009	80,152
Clinch Valley District	144,576	155,689	146,911	151,804
Other N. & W. Territory	2,323	3,418	2,651	4,239
Total N. & W. Fields	2,099,189	2,322,102	2,505,319	2,522,665
Williamson & Pond Creek	84,086	75,573	86,949	89,785
All other railroads	251,339	282,790	262,177	348,124
Grand total	2,434,614	2,680,465	2,854,445	3,005,618

Distribution of shipments for June and July follow:

	June			July		
	Shipped	Tipple	Total	Shipped	Tipple	Total
N. & W. Fields	1,375,303	11,153	1,386,456	1,519,769	12,233	1,532,002
Pocahontas	1,375,303	11,153	1,386,456	361,454	2,347	363,801
Tug River	348,737	2,370	351,107	234,568	6,960	241,528
Thacker	209,216	6,713	215,929	80,009	8,076	88,085
Kenova	81,794	8,643	90,437	80,009	8,076	88,085
Total	2,015,050	28,879	2,043,929	2,195,800	29,616	2,225,416

Shipments of coke entirely from the Pocahontas field amounted to 58,507 tons in July and 66,095 in June.

THE CAR SITUATION

The American Railway Association reports a surplus of 16,563 coal and gondola cars and a shortage of 3,251 on Oct. 1. There was a decrease in the shortage of coal cars in the Eastern group. The gross surplus of all kinds of cars on Oct. 1 was 88,061, which compares with 191,309 on Sept. 1, and 133,382 on Oct. 1 of last year. The gross shortage of all kinds of equipment on the first of the current month was 9,762, as compared with 6,300 on Sept. 1, and 2,355 on Oct. 1 of last year.

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during August and the previous two months:

	June		July		August	
	1915	1914	1915	1914	1915	1914
Coal	2,883,959	2,380,795	2,887,918	2,594,407	3,009,028	2,769,45
Coke	329,130	298,237	344,557	255,650	345,258	242,28
Total	3,213,089	2,679,023	3,232,475	2,850,057	3,354,286	3,011,73

CHICAGO LAKE ARRIVALS

Lake shipments to Chicago for September and the season to date this year and last year were as follows:

	1915		1914	
From	Hard	Soft	Hard	Soft
Buffalo	90,364	24,281	84,160	x
Oswego	22,488	x	20,558	x
Toledo	x	30,749	x	40,778
Cleveland	x	53,730	x	8,132
Erie	11,326	x	x	x
Sandusky	x	8,500	x	19,428
Ashtabula	x	8,167	x	14,665
Lorraine	x	9,500	x	x
Conneaut	x	9,050	x	x
Fairport	x	7,932	x	x
Month's total	124,178	149,909	104,718	83,003
Season's total	596,644	520,465	532,377	534,208

FOREIGN MARKETS

GREAT BRITAIN

Oct. 1—Tonnage conditions are worse than ever from the exporters' point of view as the result of the withdrawal of Greek tonnage. Stocks are now excessive and colliery owners are offering supplies on very cheap terms for early delivery. Quotations are nominally as follow:

Best Welsh steam	Nominal	Best Monmouthshires	$4.80
Best seconds	Nominal	Seconds	4.32
Seconds	$4.80	Best Cardiff smalls	3.36
Best dry coals	5.76	Cargo smalls	2.16

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is very restricted and rates continue their upward course. For Islands and South America there is no business passing at present. Rates are nominally as follows:

Gibraltar	$6.00	Naples	$9.60	St. Vincent	$5.28
Marseilles	9.65	Alexandria	10.80	Rio de Janeiro	6.72
Algiers	5.98	Port Said	10.80	Monte Video	6.96
Genoa	9.60	Las Palmas	5.04	Buenos Aires	7.20

Exports—British exports for August and the first eight months of the past three years were as follows:

	August			Eight Months		
To	1913	1914	1915	1913	1914	1915
Russia	769,794	169,353	5,923	3,794,188	3,049,527	35,495
Sweden	379,475	198,347	135,875	2,880,837	2,421,789	1,895,325
Norway	154,887	253,467	269,812	1,513,688	1,673,336	1,872,214
Denmark	248,746	243,019	320,754	1,937,492	1,861,470	2,231,186

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

✚Indicates contracts regarding which official information has been received.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

No. 918—Kansas City, Mo.—This contract (Vol. 7, p. 1,127, Vol. 8, p. 115), which provides for furnishing the Fire and Water Board with approximately 20,000 tons of coal, was awarded to the Central Coal & Coke Co., but the award was later cancelled by the City Council. The Auditing Committee reported that the bid of the Cherokee Fuel Co. averaged $2.45 per ton, as compared with $2.48 for the Central Co. On two grades the Central Co. was 10c. a ton higher than the Cherokee Co., 9c. higher on one grade, and on the two other grades 10c. lower. Owing to the general dissatisfaction with the results obtained it has been recommended that bids be advertised for again and no grades specified except those used by the city. Address Pur. Agt. C. W. Lovelace, Kansas City Municipal Water and Light Dept., Kansas City, Mo.

1003—Kansas City, Mo.—The purchases on this contract (p. 77), which provides for the fuel requirements of the Wesley Hospital, will be confined to the open market instead of covered by a contract as previously noted. Address Board of Directors, Wesley Hospital, Kansas City, Mo.

1161—Colorado Springs, Colo.—All the bids on this contract (p. 199), which provides for furnishing the local Board of Education with approximately 3,000 tons of mine-run lignite coal, have been rejected. Address Board of Education, D. E. Graff Bldg., Colorado Springs, Colo.

1262.—Des Moines, Iowa—It is reported that this contract (pp. 324, 489), which provides for furnishing the School Board with approximately 8,000 tons of steam coal, will not be negotiated for perhaps two months. The board is taking advantage of the depressed condition of the trade to make their current purchases in the open market. Tests of various coals are being conducted. Address Secy. A. L. Clinite, Bd. of Edu., Des Moines, Iowa.

1438—New Orleans, La.—This contract (p. 490), which provides for furnishing the Interstate Bank & Trust Co. with approximately 200 tons of bituminous coal, will be awarded some time during the current month. Address Pur. Agt. J. W. Billingsley, Interstate Trust & Banking Co., New Orleans, La.

1441—New Orleans, La.—We are informed that purchases on this contract (pp. 490, 616), which provides for furnishing New Orleans Cold Storage & Warehouse Co. with approximately 3500 tons of coal, will be confined to the open market. The old contract expired at the end of September and the company has since been trying out various coals. Address Purchasing Agent, New Orleans Cold Storage & Warehouse Co., Gainnie and Front Streets, New Orleans, La.

1447—New Orleans, La.—This contract (p. 490), which provides for furnishing the Jacob Candy Co. with approximately 400 tons of Pratt lump coal will not be negotiated this year. Address Pres. Mose Jacobs, Jacobs Candy Co., 823 Carondelet St., New Orleans, La.

1450—Detroit, Mich.—This contract (p. 490), which provides for furnishing Wayne County with approximately 2,500 tons of bituminous three-quarter lump coal, will probably be awarded to the P. Koenig Coal Co. of Detroit, at an advance of 10c. per ton on the old contract which this company also had. Bids guaranteeing a B.t.u. value of 14,000 were submitted as follows: P. Koenig Coal Co., Meadbrook nut, $2.80; United Fuel and Supply Co., Richwood nut, Red Jacket mine, Mattewan, W. Va., $3.20; Smithers Creek nut and slack, W. R. Johnson Coal Co., Oakland mine, Smithers, W. Va., $2.65; R. L. Aylward, Island Creek lump, Holden, W. Va., $3.25; Blue Gem, washed pea, Packard, Ky., $2.90; Kentucky nut, pea and slack, Auxner, Ky., $2.70; Island Creek nut, pea and slack, Holden, W. Va., $2.75; anthracite chestnut, Pittston, Penn., $7.50, with stove and egg, $7.25; Parker Bros. Co., Ltd., White Star nut, Merrimac, W. Va., $3.25, anthracite, chestnut, Scranton, $7.25. Address Secy. William Gutman, Bd. of Audrs., Wayne County, Detroit, Mich.

✚1453—Trinidad, Colo.—All the bids on this contract (p. 530), which provides for furnishing the local School Board with approximately 700 tons of mine-run and slack coal, have been rejected, and purchases will probably be confined to the open market. Address Secy. R. S. Gregory, School Bd. Dist. No. 1, Trinidad, Colo.

1474—Salt Lake City, Utah—Bids have been received on this contract (p. 531), which provides for furnishing the University of Utah with approximately 1,500 tons of screened slack coal as follows: C. S. Martin Coal Co., $3.25; Bamberger Coal Co., $3.25; Central Coal and Coke Co., $3.25; Woodruff-Sheets-Morris Coal Co., $3.25; Jeremy Fuel and Grain Co., $3.25; Federal Coal Co., $3.25; Citizens Coal Co., $3.25; Fischer-Kittle Coal Co., $3.25. Most bidders offered to furnish several varieties of coal and the matter has been referred to the technical staff of the University to determine which will be the most economical bid. Address University of Utah, Salt Lake City, Utah.

1515—Saratoga Springs, N. Y.—Bids have been received on this contract (p. 577), which provides for furnishing the City Hall with 200 tons of grate or egg coal as follows: Saratoga Coal Co., egg, $6.90; grate, $6.37. Independence Coal Co., egg, $6.70; grate, $6.50. G. N. Montange & Son, egg, $6.55; grate, $6.30. Address Comr. of Accounts, M. J. Mulqueen, City Hall, Saratoga Springs, N. Y.

✚1516—Philadelphia, Penn.—The lowest bids on this contract (p. 577), which provides for the deficiency requirements to fill out the supply for different city departments during the current year were as follows: Philadelphia & Reading Coal and Iron Co., (pea coal); Belmont Pumping Station, 1,500 tons at $3.48; Queen Lane Filters, 100 tons at $3.85; Emmons Coal Mining Co., pea coal, Belmont Filters, 100 tons at $4.10; buckwheat, Queen Lane Pumping Station, 3,400 tons at $2.68; (buckwheat), Roxborough Auxiliary, 500 tons at $3.09. Rogers-Corr Coal Co. (bituminous), Lardner's Point, 6,400 tons of bituminous at $2.64 f.o.b. houses, or $2.49 alongside; City Hall (buckwheat), $3.74 per ton. All prices given are on a delivered basis except where otherwise noted. Address Dir. Herman Loeb, Dept. of Supplies, Philadelphia, Penn.

New Business

1550—South Fork, Penn.—The local School Board will receive bids during the current month for furnishing and delivering coal to the school buildings as may be required during the ensuing year. Bids are requested on coal f.o.b. the P. R.R. Freight Station, and also for hauling same to the school buildings. Address Secy. John C. Penrod, School Bd., South Fork, Penn.

1551—East St. Louis, Ill.—Swift & Co., packers of this place, will receive bids during the current month for furnishing their annual coal requirements involving three or four carloads of screenings per day. The company has been purchasing in the open market for several months. Address Pur. Agt. H. C. Higgins, Swift & Co., National Stock Yards, Ill.

1552—Larksville, Penn.—The local School Board received bids until Oct. 15 for furnishing anthracite nut and pea coal to the various local school buildings, as may be required during the ensuing year. Address Secy. Thos. Heffernan, Bd. of Edu., Larksville, Penn.

1553—Westfield, Mass.—The Horse Whip Co. at this place usually contracts for their fuel requirements some time during the fall. They require about 30 tons Nov. 1, Jan. 1 and Mar. 1. They use the best grade Sonman coal. Address Treas. C. J. Bradley, Horse Whip Co., Westfield, Mass.

1554—Salem, N. J.—The county government received sealed bids until Oct. 13 for furnishing approximately 200 tons of bituminous coal to the local county buildings. Address Clk. I. C. Smashey, Salem, N. J.

1555—McKees Rocks, Penn.—The Stowe township school district will receive bids until Oct. 30 for furnishing 1¼-in. soft coal during the ensuing year. Address Secy. H. E. Emeigh, 907 Russellwood Ave., McKees Rocks, Penn.

1556—Youngstown, Ohio—The Mahoning County Commissioners will receive bids until 10 a.m., Nov. 1, for furnishing mine-run and three-quarter inch screened coal as may be required at the Court House and Jail during the ensuing year. All bidders will be required to deposit a certified check for $100, guaranteeing the faithful performance of the contract. Address Clk. Frank H. Vogan, Mahoning County Comrs., Youngstown, Ohio.

1557—East St. Louis, Ill.—Morse & Co., packers at this place, who have been confining their purchases to the open market since their contract expired in last April, will contract again about the middle of the current month for their requirements, involving three or four cars of screenings per day. Address Pur. Agt. L. Chakes, Morris & Co., National Stock Yards, Ill.

1558—California, Penn.—The California School Board is negotiating for approximately 2,000 bu. of coal for delivery during the coming season. Address Secy. W. J. Weaver, California School Bd., California, Penn.

1559—Pine City, Minn.—The Pine County Board of Commissioners will receive bids until noon, Oct. 18, for furnishing Pocahontas and Youghiougheny or white ash splint coal, as may be required at the Court House and County Poor Farm during the coming year. Address County Audr. W. H. Hamlin, Pine City, Minn.

1560—Peabody, Mass.—Sealed bids were received by the Overseers of the Poor until 5 p.m., Oct. 13, for furnishing nut and furnace coal for the City Almshouse during the ensuing year. Address Chn. Michael Sherry, Overseer of the Poor, Peabody, Mass.

1561—Le Mars, Iowa—The Plymouth County Board of Supervisors received bids until 1:30 p.m., Oct. 12, for furnishing and delivering coal as may be required by the Court House, Jail and Poor, during the year beginning Oct. 15. Address County Audr. J. M. Hayes, Bd. of Supervisors, Le Mars, Iowa.

1562—Lewistown, Penn.—The Borough Council received bids until 7:30 p.m., Oct. 11, for furnishing and delivering anthracite coal as may be required at the various hose houses and town hall during the coming season. Address Secy. J. Harry Saxton, Lewistown, Penn.

1563—Appleton City, Mo.—The Board of Education at this place is negotiating for approximately 1,500 bu. of coal to be delivered in the bins at the school building. Address Secy., Bd. of Edu., Appleton City, Mo.

1564—Cleveland, Ohio—Bids will be received until noon, Oct. 20, for furnishing coal for the outdoor relief department as may be required during the ensuing year. Specifications may be obtained from W. H. Winans, Dept. of Charities and Correction, 209 City Hall. Address bids to Comr. A. R. Callow, Purchaser of Supplies, 511 City Hall, Cleveland, Ohio.

1565—Adams, Mass.—The Berkshire Cotton Mfg. Co. usually contracts during the current month for their annual requirements of coal involving approximately 25,000 tons of bituminous mine-run. The coal is delivered at the rate of one-third less in summer than in winter, and deliveries are made on Boston and Albany trestles. The company has a storage capacity of 10,000 tons. Address Pres. C. T. Plunkett, Berkshire Cotton Mfg. Co., Adams, Mass.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

No. 614—Titusville, Penn.—This contract (Vol. 7, p. 795, Vol. 8, p. 616), which provides for furnishing the local Board of Education with approximately 2,000 tons of Greensburg stoker coal, has been awarded to **H. B. Edwards Co.**, at $2.65 per ton, delivered in bin at the high school building. Address Chn. F. C. Kirkpatrick, Supply Comr., Titusville, Penn.

1032—Cleveland, Ohio—This contract (pp. 115, 323, 410), which provides for furnishing the local Board of Education with its fuel requirements during the ensuing year, has been awarded as follows: **Cleveland, Pittsburgh Coal Co.**, bituminous lump, $8,370; **The Zettelmeyer Coal Co.**, semibituminous lump, $15,600; **Cuyahoga Coal Co.**, semibituminous mine-run, bituminous nut and slack, $72,370. Address Dir. of Schools F. C. Hogan, School Headquarters, Rockwell Ave. and East 6th St., Cleveland, Ohio.

1107—Kansas City, Mo.—This contract (pp. 157, 576), which provides for furnishing the Densmore Hotel with approximately 300 tons of slack coal, was awarded to the **Kansas City Coal Co.** Address Purchasing Agent, Densmore Hotel, 912 Locust St., Kansas City, Mo.

1199—Chattanooga, Tenn.—This contract (pp. 244, 491), which provides for furnishing the local city government with approximately 1,800 tons of coal, was erroneously noted as having been awarded to Church & Co. The award was made at $2.20 per ton, the successful bidders being as follows: **Hibler-Barnes Co.**, Brushy Mountain screened run-of-mine coal, 800 tons; **Enterprise Coal Co.**, Fentress coal, 600 tons; **Whiteside Coal Co.**, Wilder coal, 400 tons. Address Comr. E. D. Harris, Dept. of Pub. Utilities, Grounds and Bldgs., Chattanooga, Tenn.

1257—Hay Springs, Neb.—This contract (p. 324), which provides for furnishing the Board of Education School District No. 3 with coal as may be required during the coming school year, has been awarded to **Henry & Richmond**, at $4.75 per ton. Address Secy. N. L. Parsons, Bd. of Edu., Hastings, Neb.

1321—Plymouth, Ind.—This contract (pp. 367, 530), which provides for furnishing Marshall County with approximately 280 tons of Pocahontas coal has been awarded to the **West Virginia Pocahontas Coal Corporation** of Detroit, Mich., at $1.55 per ton, f.o.b. cars. Address County Audr. G. F. McCoy, Plymouth, Ind.

1344—Irene, S. D.—This contract (p. 411), which provides for furnishing the County Court House and jail with coal up to and including April of next year, has been awarded to **Fred Donaldson Co.**, of Yankton, S. D., at $6.60 per short ton. The Loonan Lumber Co. bid $6.60 and Fred Borge $6.80 per ton. Address County Audr. W. O. Nelson, Bd. of County Comrs., Irene, S. D.

1345—Rich Hill, Mo.—This contract (p. 411), which provides for furnishing the local Board of Education with approximately 4,000 bu. of coal to be delivered in the bins of the various school buildings, has been awarded to the **McComb Coal Co.**, at $2.35 per ton. Address Secy. L. C. Stonebreaker, Bd. of Edu., Rich Hill, Mo.

+1357—New Kingston, Penn.—This contract (p. 411), which provides for furnishing and delivering 500 tons of bituminous coal to the local schools, has been awarded to **B. J. Moorhead** on Cornell bituminous at $1.63 per ton. Address Secy. B. F. Davis, School Bd., New Kensington, Penn.

+1393—Troy, Ohio—This contract (p. 447), which provides for furnishing the Miami County Board of Commissioners with approximately 1,000 tons of coal for use at the County Infirmary, has been awarded to the **Fidelity Coal Co.**, at $2.75 per ton for 1½-in. screened lump, and $2.45 per ton for 1-in. screened lump, prices being f.o.b. sidetrack at the infirmary. There were three bidders on this business. Address County Audr. M. T. Staley, Miami County, Troy, Ohio.

+1394—New Castle, Penn.—This contract (p. 447), which provides for furnishing Lawrence County Court House and jail with coal during the coming season, has been awarded to **S. G. Gano**, at $2.49 per ton for Pittsburgh 1¼-in. screened coal. C. J. Strieb bid $2.72; Ramsey Bros., $2.63; New Castle Transfer & Storage Co., $2.59; John V. Travers, $2.63; Woods-Golder Construction Co., $2.63. Address Clk. James R. Lamoree, Bd. of County Comrs., New Castle, Penn.

+1395—Pinckneyville, Ill.—This contract (p. 447), which provides for furnishing Dist. No. 50 with coal during the school year ending June 30, 1916, has been awarded to the **Hale Coal Co.**, at $1.75 per ton for mine-run. Address Clk. C. H. Roe, Jr., Pinckneyville, Ill.

+1397—Pomeroy, Ohio—This contract (p. 447), which provides for furnishing the Salisbury Township Board of Education with coal, has been awarded as follows, rates being per bushel for clean lump coal: **T. C. Radford**, 11c.; **Walter White**, 11c.; **V. T. Lambert**, 12c.; **Homer Radford**, 8c.; **Will Hines**, 8c. Address Clk. Leo. J. Byrne, Salisbury Township Bd. of Edu., Pomeroy, Ohio.

1398—Vandegrift, Penn.—This contract (p. 447), which provides for furnishing the Vandergrift School District with Pittsburgh nut or No. 1 coal, has been awarded to **J. H. Claypool.** The contract involves eight carloads of coal. Address Secy. W. W. Wiggins, School Bd., Vandergrift, Penn.

+1402—New Lexington, Ohio—This contract (p. 447), which provides for furnishing the local Board of Education with lump and mine-run coal, has been awarded to George C. Butt at $2.15 per ton delivered. Address Clk. J. H. Cookson, Bd. of Edu., New Lexington, Ohio.

+1403—Omaha, Neb.—This contract (p. 448), which provides for furnishing the fuel requirements of the local Board of Education, has been awarded to the **C. W. Hull Co.** and **Sunderland Bros.** The contract provides for furnishing and delivering 8,500 tons of bituminous coal and 350 tons of anthracite, the bids on the former ranging from $3.88 to $4.42, and the anthracite being $10.08 per ton. Address Secy. W. T. Bourke, fifth floor, City Hall, Omaha, Neb.

+1411—Youngstown, Ohio—This contract (p. 448), which provides for furnishing and delivering approximately 800 tons of coal for the Public Service, has been awarded to the **Youngstown Ice Co.** on the following basis: ¾-in., $2.45; 1¼-in., $2.55; 3-in. nut, $2.40. The Crystal Ice and Storage Co. bid as follows: ¾-in., $2.65; 1¼-in., $2.60; 3-in. nut, $2.65. Address Clk. H. C. Fox, Pub. Service, Youngstown, Ohio.

+1412—Toulon, Ill.—This contract (p. 448), which provides for furnishing the Stark County Poor House, Court House and Jail with coal during the ensuing year, has been awarded to **R. L. McClellan** on lump coal from a local mine at 11c. per bu. The Ballentine Coal Co. bid 11½c. per bu. for Springfield lump. Address County Clk. W. E. Nixon, Stark County, Toulon, Ill.

+1413—Valentine, Neb.—This contract (p. 448), which provides for furnishing three carloads of coal to be delivered in the basement of the Court House, has been awarded to **J. W. Yeast & Son,** who were the only bidders at $7 per ton for Trenton lump. Address Clk. A. B. Green, Court House, Valentine, Neb.

1414—Granite City, Ill.—This contract (p. 448), which provides for furnishing the Corn Products Refining Co. with their fuel requirements until Apr. 1 of next year, has been awarded to the **North Breeze Mining Co.,** of St. Louis. The contract involves about 35,000 tons of Illinois one inch, and two inch screenings. Address Pur. Agt. S. J. Petit, 213-217 Illinois St., Chicago, Ill.

1415—New York, N. Y.—This contract (p. 448), which provides for furnishing and delivering approximately 3,000 gross tons of No. 1 buckwheat to the Bellevue Hospital has been awarded to **Pattison & Bowns,** at $2.69. Other bids were: Meeker & Co., $3.08; Burns Bros., $2.92; Charles D. Norton & Co., $2.81. Address Central Purchasing Committee, Room 1226 Municipal Bldg., New York, N. Y.

+1419—Bellaire, Ohio—This contract (p. 489), which provides for furnishing the Mead Township Board of Education with approximately 2,000 bu. of three-quarter coal has been awarded as follows: **J. H. Neff,** 750 bu. at 14¼c.; **William Ramsey,** 150 bu. at 12c.; **W. H. McCabe,** 580 bu. at 11½c.; **H. Warren,** 325 bu. at 12½c.; **Carl Dumfel,** 300 bu. at 14⅛c. Address Clk. Thomas C. Kirkland, Mead Township, Bd. of Edu., Belmont County, Bellaire, Ohio.

1423—Topeka, Kan.—This contract (p. 489), which provides for furnishing the Municipal Electric Light Department with approximately 400 tons of coal, has been awarded to the **Southwestern Coal Co.** on the following basis: Nut, $2.70; mill, $2.50; slack, $2.24. Address Supt. E. G. Stahl, Municipal Electric Light Dept., Topeka, Kan.

+1424—Warren, Ohio—This contract (p. 489), which provides for furnishing the County Infirmary with approximately 500 tons of coal, has been awarded to the **Peoples' Ice and Cold Storage Co.,** at $1.95 per ton, f.o.b. switch at the Infirmary. Address Aud. W. B. Harrington, Trumbull County, Warren, Ohio.

+1426—Rugby, N. D.—This contract (p. 489), which provides for furnishing the Pierce County Commissioners with lignite coal, has been awarded to the **Bovey-Shute Lumber Co.,** at $2.97 per ton. Address Audr. A. O. Spillum, Pierce County, Rugby, N. D.

+1429—Massillon, Ohio—The contract (p. 490), which provides for furnishing the Board of Education with coal during the ensuing year, has been awarded to the **Artificial Ice and Coal Co.** on the following basis: Massillon lump, $3.04; mine-run, $2.89; slack, $1.69; Goshen lump, $2.29; mine-run, $1.99; slack, $1.65. Prices include delivery in bins as required. Address Clk. William Fielberth, Bd. of Edu., Massillon, Ohio.

+1433—Peoria, Ill.—This contract (p. 490), which provides for furnishing the City Government with coal during the year beginning Oct. 1, has been awarded to **Dooley Bros.,** at $2 per ton for 1¼-in. lump coal The Thompson Coal Co. bid $2.05 for the same grade. Address Clk. Wm. E. Moran, Peoria, Ill.

1434—Poplar, Mont.—This contract (p. 490), which provides for furnishing Public School No. 9 with coal has been awarded to the **Poplar Lumber Improvement Co.** on Bear Creek lump at $7.50 a ton. Three other bids were received on this contract but they were too late to qualify. Address Clk. H. C. Walker, School Dist. No. 9, Poplar, Mont.

1458—Davenport, Wash.—This contract (p. 530), which provides for furnishing the Lincoln County Board of Commissioners with coal, has been awarded to **J. W. Sawyer** at $6.95 per ton for a Cascade Roslyn mine-run coal. Address J. E. Howard Bd. of County Comrs., Davenport, Wash.

Contract Notes

Fairbury, Neb.—The contract for furnishing the city government with its coal supply during the ensuing year has been awarded to **Venners & Green** at $1.72½c. per ton for Weir nut at the mine.

General—A commercial representative of a foreign government in Washington, D. C., reports that he is in receipt of requests for the name and addresses of American exporters of coke. Large quantities are desired.

Lewes, Del.—The Municipal Light Department at this place consumes about 1,000 tons of semi-bituminous coal per annum for which they pay about $1.55 per ton. It is understood that they do not contract. Address Supt. Charles Lynch, Lewes, Del.

Switzerland—An American consular officer in Switzerland reports that an association in his district desires to communicate with American producers and exporters of coal. Specifications, etc., may be had on application to the bureau of foreign and domestic commerce or its branch offices.

Boston, Mass.—The Gonic Manufacturing Co. consumes approximately 1,500 tons of bituminous coal. Deliveries are made by water and railroad at the rate of 30 tons per week, and they have a storage capacity of 1,000 tons. Address Pur. Agt. Samuel Rindge, Gonic Manufacturing Co., 4 Winthrop Square, Boston, Mass.

Cannel City, Ky.—Contracts calling for 500 tons daily of cannel coal are reported to have been made by the Pearsite Co., with the Kentucky Block Cannel Coal Co. here, the deliveries in the maximum to be reached by about the first of November when the dye extracting plant under construction here is due to be finished.

Chile, S. A.—The chief engineer of a gas company in Chile has informed a commercial attache of the Department of Commerce that he desires to obtain samples of the best American coking coal. The commercial attache has transmitted a report on this opportunity, which may be had on application at the bureau or its branch offices.

South Norwalk, Conn.—The South Norwalk Electric Works consumes about 1,500 to 2,000 tons of bituminous coal per annum, which is bought from local dealers at from $3.38 to $3.50 per ton. The company is using fuel oil mostly. Contracts are made at indeterminate periods. Address, Chf. Engr., W. H. Mosher, The South Norwalk Electric Works, South Norwalk, Conn.

Egypt—The steamer "Franklin" sailed from Baltimore Sept. 30 with 7,000 tons of Fairmont in the hold and 1,600 tons in the bunkers on her first trip, bound to Alexandria, Egypt. This inaugurates the regular Mediterranean service arranged by the Consolidation Coal Co. A sister ship, the "Plymouth," will be in commission in the course of a month. These ships are owned by the Coastwise Transportation Co. of Boston and are named for counties in Massachusetts.

East St. Louis—The City Council of East St. Louis, Ill., has awarded to the **William Helfrish Coal Co.,** East St. Louis, the contract for furnishing about 1,000 tons of 2-in. shaker screened coal to the City Hall, fire department and pumping stations for the period beginning Sept. 1 and ending May 1. The price is $1.60 delivered. There were eight bidders in all. The contract last year was held by the Huschle Coal Co., East St. Louis. Address Clk. David M. Walsh, East St. Louis, Ill.

Boston, Mass.—In the face of the uncertainty over conditions next season, there was a mild flurry in the market here a week ago over the rumor that one of the large distributors of Hampton Roads coals had named a low delivered price for the year beginning Apr. 1, 1916. It turned out, however, that what was named was simply a low charge for handling: that is, 75c. was quoted to include transportation from the Virginia terminals to Boston, insurance, discharging, and weighing. The proposal contemplates the use of two steamers, one of 12,600 and the other of 9,000 tons, and of a modern handling plant near Mystic Wharf, Boston. The price named is $3.60 per gross ton f.o.b. cars but it is expressly conditioned on the present circular price of $2.85 f.o.b. Hampton Roads. In other words, if the circular price of Pocahontas and New River coals for next year is higher or lower than $2.85, the distributors' contract price would be correspondingly raised or lowered, the intention being to add 75c. to the circular price in order to cover freight and handling at this end. The present railroad charge for discharging at Boston is 18c. with 3c. added for weighing when required. Subtracting 21c. from 75c. would leave but 54c. to cover water freight and insurance. This circular has been followed by others from competing distributors and it is likely that consumers inland will profit next year from this anxiety to book contracts.

COAL AGE

Vol. 8 NEW YORK, OCTOBER 23, 1915 No. 17

Some Things Night Schools Do Not Teach

If you haven't a school for your employees, start one now. If you have one, see that the instruction includes work here referred to. If you are developing a course on the line suggested, give us the details.

Night schools are great institutions for ambitious men who desire to advance in coal mining, but they should concern themselves with other subjects in addition to English, mathematics, gases and problems of ventilation.

It is necessary that the mining man be taught to assume the right attitude toward his associates, whether they work with him or for him. Patronage of night schools is the logical way for the men to receive this training.

A candidate for a mine foreman's certificate may have completed satisfactorily the entire course of theoretical instruction arranged by any large coal company, and still this man may not be competent to fill the place of foreman.

The boss, to be a good one, must inspire loyalty and secure the interest of his employees. To do this it is essential that he be in sympathy with them, that he be strict but fair in his discipline and that he give to each of the multitude of mining details its relative importance.

It is very foolish to believe that the man who has the real, genuine "stuff" in him will develop and exercise even a small portion of the necessary qualities in a hit-or-miss manner.

Why not include instruction in the essentials of management in the night-school course? They are just as vital to the making of a successful foreman as the practical knowledge of ventilation or drainage.

It's a long jump from a coal mine to a big New York department store, but the plan of the latter in operating schools of instruction for employees, who are taught proper address to use in their daily contact with a conglomerate humanity, could be copied and applied in modified form at our mines. When a few employees are encouraged to accept right ideals, the spirit will soon be caught by the rest of the organization, and contrary internal forces will no longer pull against each other.

The miner should be taught the easiest, safest and quickest way of taking out a cut, standing timber, constructing a brattice, loading a car and transporting the coal. So many men use wrong methods simply because they see their "buddy" do it, and this could be eliminated by proper instruction.

Employers should not only direct the efforts and ambitions of their employees while at work, but also after working hours. It is these idle hours and the way they are filled in that make the man.

Ideas and Suggestions

A Plea for Conservation

By Geo. N. Lantz*

We criticize our forefathers for their methods of using and misusing timber—a natural resource for the benefit of the many, rather than the few.

We say that they took from us our heritage.

We blame them for the wasteful methods which ruthlessly destroyed their timber and ours.

We feel that they had no more right to deliberately waste and destroy than a man on his deathbed has a right to give orders for the destruction of his mills and factories.

We believe that the timber owners should have agreed among themselves to name such a price for their product as would insure a fair profit on all timber—such a price as would insure the economic operation of timber lands and would prevent the destruction of the little trees while the big trees were being cut in the logging camps.

We feel that the consumer should have been willing to bear a slightly higher cost, if not for business reasons, then from patriotic motives. Our forebears contracted debts for us to pay; they should have left us the wealth with which to pay them.

We believe that the public in those bygone days should have evinced sufficient interest to see that our rights were protected.

The State Should Have Interfered

After the failure of the timber owners, the consumers and the public, we feel that the state should have so regulated the lumber business as to permit a fair profit and compel conservative operation—to admit maximum production and to insist upon the elimination of waste.

We believe we are impartial when we so criticize our ancestors.

But we can justify them, in part. Some of the lands they depleted of timber were rendered more useful for other purposes. Much of the land was needed for other purposes. The lands so depleted could again be planted in timber; and, in their ignorance, they did not realize that timber would ever be an expensive commodity—they considered the supply inexhaustible.

Likewise will our progeny criticize us for our present methods of using and misusing coal—a natural resource for the benefit of the many, rather than the few.

They will accuse us of stealing their heritage.

They will find much to criticize in our methods of mining that permit of our covering up for all time coal that belongs to us and to them.

They will place us in the same class with a man who, knowing the end of his life was near, would go out and kill his cattle and chop down his orchards.

They will know of remedies for the conditions that shaped our course.

They will say that coal operators should have coöperated to secure a fair price for their coal; such a price as would have given a fair profit; such a price as would have permitted the extraction of thick seams and thin seams and insured property against loss.

They will feel that the consumers should have been willing to pay more, for patriotic reasons, if not for business reasons. They will cite the multitude of state, county and municipal bonds we issued for them to pay and will claim justly that we should have left them the wealth we now destroy.

They will blame the public for permitting their rights to be violated.

They will say that in the absence of any action on the part of the producers, consumers or public the state should have so regulated the mining business as to permit a fair profit and to compel conservative operation—to admit maximum output and to forbid waste.

They will be justified in so criticizing us, for they will be unable to find any extenuating circumstances.

We do not add to the value of the land by extracting the coal. We can never replace the products of our mines; we know the supply is limited.

---

United We Stand, Divided We Fall

By Pennsylvania Engineer

The coal-mining industry is a house divided. With a steep and rocky path ahead, internal strife is making the going more hazardous. While operators and miners should coöperate for their mutual benefit, they are really fighting each other, and so long as operator and miner are at "loggerheads" so long will trouble be with us.

Operator must meet miner, and miner must meet operator, on a fair and square basis. The miner must sober up and work every day the mine works. He must cease being a "floater," settle down and become a man in whom the operator can place confidence. He must endeavor to load only clean coal and must mine his coal as completely as possible with safety.

Giving Full Value Received

If a day man he must do a full day's work for his pay. He must not "soldier" a couple of hours away, but must make his work count, so that at the end of the day the company has received full value for his wage. If a driver he must strive to do the best he can and with the least abuse to the animals and rolling stock. The foreman and assistants must in every way plan and execute their work in the safest and most economical manner.

On the other hand the operator must meet his men openly and frankly. The miner today unconsciously forms an antagonistic opinion of the operator owing to ignorance of the facts. Let the operator be honest and straightforward in his dealings with his employees. If the price of coal is low and the increase in wages asked for cannot be met, explain this to them as man to man.

It certainly concerns them and they should know the facts.

Provide good dwellings, and realize that there is a distinction between the men. One man is accustomed to better home surroundings than another, and in order to receive full efficiency from both men, this fact must be realized and considered. The company that can make its employees feel that it has their welfare at heart can save many unearned dollars from passing through the pay window.

While all the above seems mere "rot" when we think of the average foreign-born coal miner, yet if he could in some way be made to feel that by helping the company in this way he will help himself, his "buddy" and the whole coal-mining industry, then he would soon develop a loyal feeling toward his employer, providing his employer in turn did his part.

It is time that the operator and miner got together, for by fighting one another they are only fighting themselves, wasting their resources in a cause which does nobody any good, but saps the vitality and weakens the strength of both.

⁂

Handling Mine Supplies

By H. H. Warner*

The proper handling of repair parts and supplies at a coal mine is a subject that should receive the close attention of both the operating and office forces. Regardless of what system is installed, many leaks can occur if proper care is not taken. When the operating department fails to interest itself in the conservation of mine supplies, leaving the matter entirely to the office force, the result is that the records frequently fall behind, and it is then likely that the next inventory will show that the company has been keeping records which are of no value.

Where a stock ledger is used, it should be kept up to date, so that it will not only control the stock, but may be used as a check against purchases of material. The following is a popular system and I believe will meet all requirements:

First, take a complete inventory of all material, repair parts and supplies in stock. After the inventory has been rechecked, the total amount will be the control over these items in dollars and cents. Separate all items under the various headings which are used to govern the operation of a mine; for instance, timbers, track material, bolts and nuts, blacksmith iron, repairs for pit cars, mining-machine repairs, motor repairs, electrical supplies, construction material, etc. This will give a separate total of the amount of money tied up in parts, with such total divided into its respective departments.

USE A SEPARATE PAGE FOR EACH ITEM

In writing the ledger use one page for each and every item, no matter how small an amount is on hand. The ledger is indexed according to the different departments or the different classes of material used in that department. By doing this the items are located in the ledger much more conveniently and satisfactorily than when they are indexed alphabetically. When the latter plan is used, such repair parts as are employed in the operation of coal-mining machines will be scattered through the ledger from A to Z. This would make it necessary to leaf each and every page in order to locate the different items.

When the ledger is posted according to the inventory and checked to balance with the controlling amount, all invoices received are charged under the proper account in the ledger. Where freight is paid out to get such items into stock, this freight should be added to the amount of the invoice and separated among the items the invoice calls for. It is also well to remember that this amount is charged to the ledger instead of the original amount of the invoice. Such a plan is always followed except where a freight account is carried and charged off against daily operation.

Invoices are kept intact for one month and then listed on the debit side of what is known as the repair, supply and material balance sheet. When material is taken out of stock and used, the mine superintendent or mine manager must furnish the office or the supply clerk with a requisition form of such items. This requisition should have an extension column for the amount, so that when it is turned into the office the articles can be priced and the amount extended, always using the ledger as a guide in making these extensions, so that when the stock of a certain article is depleted, the ledger page on that particular item will balance. After the requisition has been extended, the stock ledger account is credited with the items and amounts shown.

ACCOUNTS ARE BALANCED EACH MONTH

At the end of the month these requisitions are listed on the credit side of the balance sheet. Then by adding the last controlling figure of the previous month to the total debits of stock minus the credits, a new controlling figure will result.

The ledger invariably should be balanced every month. No debit entry should be made to the stock ledger until the material covered by the invoice has been received and placed in stock. If there is a shortage of material received from that shown on the invoice, this item should be cut off of the invoice and the balance properly charged to the ledger. Invoices should be received either in duplicate or triplicate, as this will always leave at least one copy for the stock-record file for future reference.

The system described will have to be kept up every day, especially where the items used are charged against the cost of daily operation. If it is not kept up, there will result a loose handling of the items covered in these records; and to save the records from this fate, both the office head and the operating head should see that the system is carried out as outlined and that requisitions are properly made out for all items, with proper charges and credits made after the invoices and requisitions have been received in the office. In other words, the supplies and materials should be guarded with just as much care as will be exercised in looking after an amount of cash equal to what the items represent.

⁂

One Authority Says: "Eighty-five per cent. of the coal of all Canada is in the province of Alberta. Sixty per cent. of the coal in the British Empire is in Alberta. One-sixth of the coal in the entire world is in Alberta. Here is another way of considering it: Alberta, during the past 20 years, has produced about 20,000,000 tons. At that rate it would take 1,072,000 years to exhaust all her coal areas. At the rate Canada is using coal now Alberta could supply the Dominion for 100,000 years. At the rate the world is using coal, Alberta could keep up a continuous supply for the whole world for the next 100 years, and then have coal on hand."

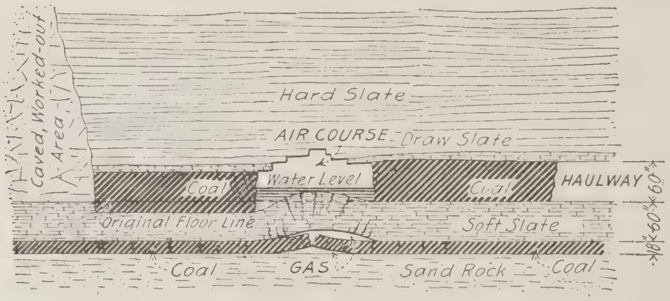
Unexpected Emission of Gas

By F. C. Cornet*

SYNOPSIS—Owing to the fracturing of a lower and unworkable seam and to the crevicing of the slate measure above it, gas is allowed to escape into a mine working which prior to that occurrence had always been entirely nongaseous. The current is reversed so that this gas may no longer be driven toward the working faces.

The accompanying sketch shows a cross-section of the mine workings skirting a large worked-out territory. The weight of the overlying strata has forced down a narrow pillar of coal into the soft slate pavement. This pillar for nearly half a mile separates the worked-out area from an important air course, which serves to ventilate distant workings where a number of men are employed. The air course is also a drain for the abundant waters that find their way from the surface into the mine through the worked-out territory.



CROSS-SECTION OF MINE WORKINGS

Although the pillar to the left of the air course has sunk nearly two feet into a soft bottom, the pillar on the opposite side has not yet been appreciably driven downward. There is no doubt, however, in my mind that this pillar is slowly sinking and would have sunk deeper before this had it not been that the water from the worked-out area was intercepted by the air course and so diverted to the outside. No doubt some of the water finds its way toward the place designated as "haulway," seeping there through the soft slate pavement, softening the latter and thus making it give way slowly but surely under the weight of the 1,400 ft. of hill bearing upon it.

As shown by the sketch, when the pillar on the left sank into the soft bottom, rendered still softer by water, it compressed this bottom so that some of it was squeezed outward. As there was no empty space to the left, it is not likely that much if any of the slate forced out went in that direction. But there is ample evidence that much of it was driven into the air course, causing the pavement to heave until only one-half of the original headroom was left.

Lower Seam Is Broken by Floor Stresses

Under the soft slate that constitutes the pavement of this seam, another seam of coal is always found the thickness of which varies from a few inches to several feet. The thickness of the intervening slate runs from 2 to 80 ft. At the particular point shown by the sketch, this slate was found to be 5 ft. thick and the lower seam of coal to measure 18 in.

The lower seam rests, without adhering to it, on the highly polished surface of the hardest kind of sandstone. Its unusual smoothness indicates that in remote geologic times there must have been much friction caused by the coal sliding on the sandrock or the sandrock moving under the coal.

The lower seam does not adhere much to the overlying soft slate, but the contact surface between the two is uneven and rough enough to make it likely that when the 5 ft. of soft slate was squeezed out toward the air course there was a tendency on the part of the lower seam to go with it at least part of the way, especially as such a displacement was facilitated by the smooth and polished condition of the surface of the sandrock lying underneath.

It is not hard to imagine that in the lateral displacement of both the soft slate and the lower seam such conditions might be caused as shown by the sketch, in which the soft slate not only has heaved into the air course above, but has also separated itself from the coal underneath after displacing it and causing fissures to appear in it running in all directions. The lower seam might also have been raised partially above the sandstone. Cavities would thus be formed as shown, partly filled with débris of slate and coal, but open enough to afford easy intercommunication between all the cracks and fissures mentioned.

The heaving of the floor of the air course could not well occur without some cracks appearing in the slate of which the floor is constituted. One or more of these cracks reaching through the 5 ft. of slate would suffice to maintain a free outlet into the air course for any gas liberated by the lower seam.

No Gas Till the Lower Seam Was Fractured

The mine where this condition obtains is quite large. It is in one of the seams of the New River series. Operations had been prosecuted in it for several years and had reached far into the hills. Notwithstanding the most watchful vigilance, no gas had ever been detected in the workings. In a way more or less vague the authorities knew of what has been designated here as the "lower seam," but they never gave it more than a passing thought. They were far from expecting trouble from its presence.

But one morning a year ago a man had his hair and eyebrows singed, besides being badly scared. He set fire to a small body of gas near the roof in a place where nothing but fresh air coming direct from the fan was supposed to travel. During the next ten days four more inflammations took place, none of them serious. All were under like conditions and on a split of air between the fan and the first working places. No air reaching the spots where the accidents occurred could possibly have swept any coal except such as had been exposed to a ventilating current for at least two or three years.

No gas had ever been found at the faces. But any gas they might have found there could not by any means have been made to travel toward the fan against the air. After the first inflammation, the officials proposed making an inspection of the airways by traveling against the current from the spots where the accidents had happened, but they soon ran into some water 2 ft. deep and the inspection stopped there.

---

*Mining engineer and geologist, Charleston, W. Va.

After four more explosions had occurred, a pair of rubber boots was telephoned for, and a man carrying a safety lamp was sent through the water. He did not see anything, but soon heard gas bubbling through the water and hastened to report his discovery to the foreman, who immediately understood how the mysterious accidents had occurred. A thorough investigation was made, and the sketch incorporated in this paper was prepared. The ventilation was reversed so that the fan drew the air to the mine mouth instead of driving it toward the working faces.

Though a year has passed since that time the gas from the lower seam is still passing through the cracks in the pavement and bubbling through the water in large quantity, which tends to show that when the soft slate was squeezed out from under the narrow air-course pillar, it must have disturbed and creviced a large area of the lower seam, or such a large amount of gas would not have been liberated.

Extracts from a Superintendent's Diary

Occasionally an intelligent, conscientious, hard-working employee labors on year after year without winning promotion, simply because no vacancies occur in the ranks above him. For such a man there is not a line of sympathetic advice in the whole range of literature, or if there is I have not been able to find it.

Last week one of our mining engineers tried to commit suicide, and because of the contents of a note that he prepared, thinking that it would not be read until after his death, I became interested in the subject of giving advice, especially to men who might consider themselves failures, judged by present standards, and I have read everything that seemed to bear on the subject.

It is surprising to note how all of the present-day writers on the subject of getting ahead in the world emphasize the fact that there are not enough "hundred-thousand-dollar-per-year" men to go around, and the natural conclusion to be drawn is that anyone who has the proper stuff under his cranium cannot fail to climb into the hundred-thousand-dollar class in short order.

In fact, that is exactly the conclusion our mining engineer came to some time ago, and because he did not succeed in getting advancement in spite of earnest effort, he became morose and discouraged, and finally reached a stage where he considered himself a rank failure and decided that he would be justified in ending his life.

Since his partial recovery, I have had several long talks with him and have obtained an insight into the effect that too much rose-colored exhortation may have on average men who are already making desperate efforts to reach heights which are not beyond their reach unless they become impatient.

And profiting by the insight given me, I have been able to recall some of my associates of past years and to account for many of the queer actions that characterized their last years on earth. It is all so clear now—the warning that was withheld from them, the realization of which would have carried them smiling across the long stretches of discouragement. The vision is so clear to my mind and has made such an impression upon me that I in turn have been able to interest the despondent man, and he has become eager to try his luck again.

But if I were compelled to write out a few suggestions for the guidance and encouragement of young men, I feel sure that I, too, would find myself quickly running to rosy themes.

To suggest to ambitious men that it would not be possible or desirable for all climbers to climb to the same heights seems like throwing cold water on a fire that one is trying to kindle.

It's all very well to say that most of the pleasure of living is derived from anticipation—in fact, there are plenty of men who have already said that—but how can one convey to a struggling soul the idea that anticipation may joyously be spread over a long series of years and even be carried triumphantly into the grave without having been turned into realization?

After all, in spite of the tons of literature that are being printed every year, it seems that there are some truths that have not been given to the world yet—at least not in terms that are intelligible to all of us; and that probably accounts for much of the literary effort still being put forth.

Anthracite Coal Shipments Far Behind Last Year

Total shipments of anthracite coal for the first nine months of this year, as compiled by the Anthracite Bureau of Information, were 2,688,470 tons less than for the first nine months of 1914. Shipments of anthracite for September were 5,518,771 tons, as against 6,246,192 tons in September, 1914, a decrease of 727,421 tons. The amount of coal on hand at tidewater shipping ports decreased 20,158 tons, from 653,496 tons on Aug. 31 to 633,338 tons on Sept 30.

This shortage of over 2,500,000 tons as compared with last year is partly owing to a decrease in consumption on account of the mild weather last winter and partly to the fact, reported by sales agencies and dealers, that domestic consumers have postponed buying their winter supply till the last minute.

The Lehigh Valley led in tonnage for the month, with 1,093,283 tons; the Philadelphia & Reading was second, with 895,718 tons; and the Lackawanna was third, with 820,440 tons. The Delaware & Hudson carried 737,592 tons, the Erie 718,751 tons, the Jersey Central 626,237 tons, the Pennsylvania 467,587 tons and the New York, Ontario & Western 159,163 tons.

⁂

Responsibility for Defective Equipment—A coal operator is not liable for injury to an employee resulting from absence of a bumper on a tram car, it having been broken off, unless the defect had existed long enough to have afforded the operator opportunity to discover and remedy it, in the exercise of a reasonable degree of care for the safety of his employees. (Alabama Court of Appeals, Westbrook vs. Sloss-Sheffield Steel and Iron Co., 69 Southern Reporter, 311.)

⁂

The Southern Appalachian Coal Operators' Association held its third quarterly meeting at the Cumberland Hotel, Middlesboro, Ky., Friday, Oct. 22, at 7:30 p.m. Reports from the chairmen of the several committees were read, and a paper on "Cost Keeping," by G. M. Shoemaker, of La Follette, was presented. The meeting was an open one, nonmembers being invited.

Making Fuel Out of Garbage

By W. D. Hornaday*

SYNOPSIS—All the city garbage of San Antonio, Tex., that can be burned is made into briquettes and sold for $6.50 per ton. Shoes, hats, paper, rags, manure, etc., are all included in the raw product from which the fuel bricks are made.

Manufacturing a high-grade fuel from garbage is a new industry that promises to solve the problem of disposing of the waste of towns and cities. In October of last year the first experimental plant of a new garbage-disposal process was established in San Antonio, Tex. It has proved so successful that a large plant is to be erected in Austin, Tex., by E. L. Culver, who is the inventor of the new process, and his associates. They have entered into a contract with the city by which they receive 25c. a ton for all the waste delivered at the plant. This is about 50c. per ton less than it now costs the city to dispose of its garbage.

FUEL-BRICK PLANT AT SAN ANTONIO, TEX.

FUEL BRICKS MADE FROM GARBAGE

The important feature of the new method of handling the waste that comes from the streets and alleys is that it is converted into a fuel that is said to be equal to bituminous coal. Mr. Culver began investigating the possibility and practicability of commercializing municipal garbage about five years ago. As a result of a long series of experiments he proved the adaptability of a method for making fuel bricks out of the refuse. This is accomplished in much the same manner that stiff mud-bricks are made. He employs practically the same machinery that is used in making cut mud-bricks. There is this difference in the process, however—the fuel bricks are not required to be as smooth and perfect as building bricks. The fuel bricks are dried in the sun or open air instead of in kilns. To produce this new fuel from garbage a mixture of equal quantities of coal dust and garbage, with an addition of 7 per cent. of water tar from gas plants or oil refineries, is used.

It takes one thousand of the fuel bricks to make a ton. They are clean and dustless and are easy and convenient to handle. In San Antonio the new fuel is being used by many people in their homes. The demand for it is said to be much greater than the supply. Its advantages are as follows: It will not slack, no matter how long it is kept in storage; it is impervious to water and burns to ashes without leaving a semblance of clinkers; and it produces no odor and little smoke when being burned. Dr. William B. Phillips, who recently experimented with the fuel bricks by burning a number of them in an open grate at his home, reports the following results:

"The briquettes had no disagreeable odor whatsoever, smelling faintly of tar; they were easy to handle, cleanly, easy to fire, gave no excess of smoke over ordinary bituminous coal, did not clinker and did not give any trouble at all in the grate. These briquettes were entirely consumed and preserved their rectangular shape, even when in the form of ashes. I was pleased with the results of burning the briquettes and would use them regularly if they could be supplied at a price comparable with that which we pay for bituminous coal in Texas—generally $8.50 per ton."

Old Shoes, Hats, Etc., Made into Briquettes

The remarkable spectacle of seeing old shoes, hats, paper, rags, straw, manure, house garbage, night soil and a variety of other waste products being thrown into one machine and emerging from another in the shape of a perfect fuel brick is to be witnessed daily at the plant in operation at San Antonio. The finished product bears no resemblance to the raw materials that enter into its manufacture. The process performs the important work of sanitation, which is considered of the utmost importance in disposing of municipal garbage. In San Antonio the experimental plant is to be enlarged so as to handle the garbage of the entire city, a contract to this effect having just been entered into by the municipal authorities and the fuel company. The City Commission of Austin, after a thorough investigation, decided to abandon its garbage incinerator and adopt the new process.

F. M. Gunn, of the Massachusetts Institute of Technology, who recently delivered a series of lectures on sanitation and garbage disposal at the University of Texas, expressed the opinion that the process which Mr. Culver invented is one of the most promising schemes so far advanced for handling city refuse.

---

*Austin, Tex.

"It certainly appears to me that this is the best way of getting rid of waste and rubbish in a sanitary manner," he said, "and it may be that this method will work a new epoch in the garbage problems of the country."

In discussing the sanitary phase of the new method of handling the rubbish of towns and cities, Mr. Culver said:

"The importance of the proper disposal of waste matter in cities and towns has been recognized by health authorities and sanitary engineers everywhere, and for a few years past has been receiving the most careful and serious attention as one of the really urgent questions relating to the development of the modern city. Interest in matters affecting the public health is more widely manifested now than ever before, especially with regard to the spread of disease known to be infectious and contagious. Garbage and refuse of all kinds, if not properly taken care of, become an immediate menace to the health of the community, besides furnishing a fertile soil for the production of all manner of disease germs.

OLD DUMP METHOD OF DISPOSING OF GARBAGE

The Danger of Garbage Piles

"Garbage is also the breeding place of flies and other disease-carrying insects. The removal of waste, while protecting the city, merely carries the danger somewhere else; and the problem may be passed on, but it is not solved by the practice followed in so many cities of dumping into the rivers, streams and lakes of the country all the sewerage and the larger part of the garbage. Instead of being eliminated, the peril to the public health is greatly increased, the risk of diseases is spread over a still larger area, the air is polluted by foul odors and all the natural beauties are destroyed by such abuse.

"A satisfactory solution of the problem of sanitary disposal of the waste of cities has been difficult indeed, and the various methods adopted have been largely makeshifts of doubtful value. The method of incineration has been perhaps the best, and yet the process is open to serious objections, because the fumes from the incinerator are neither deodorized nor disinfected. So from a sanitary standpoint there is not enough accomplished to justify the large initial cost of erecting these incinerating plants with their additional heavy annual expense of maintenance, which is so great that most cities are now discarding them and using the old dumping ground."

The mechanical arrangement of the garbage-fuel plant is simple. The refuse is unloaded from wagons upon a sorting platform and then sprayed with creosote, not only as a sanitary precaution, but to allow the sorters to work with comfort. Through holes in the platform the garbage is dropped onto conveyors, which carry it to the various departments of the plant. The iron is carried into storage bins; dead animals are conveyed to the fertilizer department; bottles to the washing tank; ashes, stone and brick to a dump; tin cans to an incinerator, which removes the solder, the remaining tin pieces being baled; and the residue of the garbage is conveyed to the fuel-manufacturing department where it is made into bricks.

The entire plant is tightly inclosed so as to keep dust from escaping. The cost of manufacturing the fuel bricks is about $1.80 per ton. They sell in San Antonio for $6.50 per ton.

⁂

Stocking Operations of the Western Railroads

Numerous rumors have been current as to plans of the different Western railroads for storing coal in anticipation of a cessation of work at the mines pending wage negotiations next spring, and an investigation develops that there is some activity in this direction.

The C., B. & Q. R.R. has arranged to store 200,000 tons at its principal coaling stations. The work was commenced several weeks ago, and that road has already approximately 190,000 tons unloaded on the ground.

While the Illinois Central R.R. has not yet commenced to stock up, it is considering the question of putting a 40 days' supply in storage, concentrating the coal at two or three central points, where there will be a regular organization for reloading, including Brownhoists, clamshells, etc.

The New York Central Lines contemplate storing a 60 days' supply on their Western lines and have already commenced unloading the coal on the ground. The Michigan Central may commence stocking at any time at its principal terminals.

The Rock Island Lines contemplate the storage of approximately 300,000 tons, or nearly a 40 days' supply, to be placed at convenient terminals. The unloading of this coal on the ground will begin immediately.

No immediate action is contemplated by such roads as the Northwestern, St. Paul, Alton, C. & E. I. and C., G. W. R.R., and it is thought that they will not commence to store coal on the ground until late in the winter, probably two or three months before the mines are shut down.

With the view of utilizing the least equipment in moving the coal, most carriers are attempting to place their storage piles at points nearest to the mines furnishing the coal. The usual method is to pile the coal on dry and well-drained locations if trestles 10 or 12 ft. high cannot be built from second-hand timbers. Tracks are not built on the coal piles for unloading or reloading, and almost always clamshells or mechanical devices are used in handling the coal. Coal is not piled to exceed 10 ft. high and 25 ft. wide at the base. Frequent openings are allowed, about 50 ft. apart, halfway down to the ground, to permit easy separation of coal which may catch fire. Every effort is made to assist the admission of air to the interior of storage piles through passages formed by timbers, piers, brickwork or other objects projecting into the coal.

Coal Shipments Through the Panama Canal

By James Steelman*

SYNOPSIS—The amount of coal passing through the Panama Canal is increasing. The most of this fuel is of American origin. It is by no means certain that the prices charged for bunker coal at the canal cover the real cost. The specifications on this fuel are such that only about the best steam coal in the country can meet them.

The Panama Canal was formally opened for business upon Aug. 15, 1914, so that by Oct. 15 an experience of two months had accrued. Leaving aside the passage of noncommercial vessels, the canal in this period witnessed the transportation through it of 583,949 tons of cargo, or an average of about 9,500 tons per day. The semiofficial statement was made, in reference to the business done by the canal for the first month and a half, to the effect that expectations had been exceeded. This seems promising, especially when we take into account that the great European War had been raging all the time.

One-half of all the business done during the first two months related to shipments between the east and west coasts of the United States, the Hawaiian Islands being reckoned in with the Pacific Coast. In respect to the character of the shipments, the general statement may be made that the cargoes passing from east to west were manufactured goods; and the cargoes passing from west to east consisted chiefly of canned goods (fruits, vegetables, salmon), lumber, grain, sugar and pineapples.

The number of passages of ships engaged in American business totaled distinctly less than 50 per cent. of all passages, while the American cargo tonnage was almost exactly 50 per cent. of the total. This shows that the domestic business was carried in vessels of a size greater than the average of those using the canal.

The trade route disclosed as next in importance is that between eastern United States and western South America. Along this route 19 per cent. of the traffic passed, so that this business, while second to our domestic interchange, was not yet a good second. Of the 19 per cent., five-sixths was northbound. This corroborates the indications perceivable before the opening. We buy from western South America, but we do not sell to any extent.

The third route in point of importance, as disclosed by the record, witnessed shipments having a total percentage of 13 out of the grand aggregate of all canal business. This route connects the Pacific Coast and Europe. Nearly the whole of these shipments went in one direction and consisted of grain. Manufactured goods from Belgium constituted 1 per cent. out of the 13.

S.S. "ANCON" PASSING THE CUCARACHA SLIDE WHEN CANAL WAS FIRST OPENED

The fourth route connects eastern United States with China and Japan. The business on it constituted 9 per cent. of the grand total of all traffic through the canal. The whole of this Far Eastern business went in one direction—from the Gulf of Mexico, Philadelphia and New York—and consisted of petroleum products.

Coal and Coke Shipments

An important development has concerned coal shipments to ports other than those at the termini of the canal itself. There were no shipments at all until Sept. 19, 1914—over a month subsequent to the canal opening. Between Sept. 19 and Oct. 3 inclusive, 34,545 tons of

---

*No. 618 West 136th St., New York City.

S.S. "SANTA CLARA" ON ITS WAY THROUGH CANAL

S.S. "ANCON" IN UPPER LOCKS AT MIRAFLORES

coal passed through the canal, nearly all of it bound for western ports of North America. The remainder (6,010 tons) went to Valparaiso. It will be seen that the coal business was responsible for 6 per cent. of all business done by the canal in the first two months.

From the commercial opening of the canal to Aug. 1, 1915—nearly one year of operation, all of the period within wartime—56½ cargoes of coal and 8½ cargoes of coke have gone westward through the waterway. Coal, however, did not begin to pass through until Sept. 19. Within the 46 succeeding weeks, the coal and coke cargoes have averaged 1.41 shipments per week. But this does not give a correct view of what is now going on.

Prior to May 24, 1915, there were weeks, many of them, showing no cargo shipment of coal or coke. But since that date, no single week up to Aug. 1 (the final date of the record at the time of writing) passed without such a shipment. There were in all during this period 24½ cargoes of coal and 7½ of coke, all going west. The average for these 10 weeks was accordingly 3.20 cargoes per week. This is more than double the weekly average for the whole 46 weeks. Apparently coal shipments through the canal are decidedly upon the increase.

It will be of interest to note whence and whither the coal and the coke are going. I begin with the 7½ coke shipments. There were three of these from Baltimore—two went to Coquimbo, one to Antofagasta. Two and one-half cargoes went from Norfolk—one to Cruz Grande, one to Valparaiso and the half cargo to Callao. Of the remaining two shipments, one was from Leith, England, to San Francisco and the other from Barry to Santa Rosalia. So much for the coke.

Of the 24½ coal shipments, 15½ went out from Hampton Roads. Five of these were destined for San Francisco and three for San Diego. Four shipments went to Tiburon. The remaining three and one-half were distributed to Manila, Valparaiso and Callao. Three shipments originated at Baltimore—two for San Francisco and one for Seattle. Philadelphia was responsible for just two cargoes—one for San Francisco and one for Bremerton. There remain four cargoes to be accounted for. One was a shipment from Cardiff to Balboa, one from Guantanamo to Gatun Lake and two from Kingston to the Pacific Ocean. These last two cargoes were doubtless destined for the use of the British navy.

ORIGIN OF COAL AND COKE SHIPMENTS

It is of interest to note that the foregoing shipments represent, for the most part, business originating in the United States. Five and one-half out of 7½ coke cargoes

A TOWING LOCOMOTIVE AT GATUN LOCKS READY TO MAKE FAST TO A VESSEL went from Baltimore and Hampton Roads. Twenty and one-half of the 24½ coal shipments originated at Hampton Roads, Baltimore and Philadelphia. This preponderance of American shipments is due largely no doubt to the occupation of Great Britain and Germany with the war.

The destinations of the coke were mostly foreign points, only one shipment being for the Pacific Coast. Of the coal shipments, eight were for San Francisco, three for San Diego, one for Seattle, one for Gatun Lake, one for Balboa and one for Manila. The Balboa shipment may possibly not have had this point as its final destination. Counting it, however, we have 15 cargoes out of 24½ for the United States and possessions.

Apparently the canal business is moving along in good shape, notwithstanding the war, the coal industry being responsible for its share. There is, however, still another angle from which we may view coal and the Panama Canal. A considerable percentage of the ships passing through naturally require bunker coal somewhere on the voyage. Some will get their fuel at Hampton Roads, others perhaps at other points; but a large proportion will undoubtedly bunker at the canal itself. The Government is providing large facilities for this business, which will be at the disposal of all those requiring coal. Further, the two great storage yards and mechanical equipment which are to go into commission shortly will be at the service of private parties and concerns which wish to participate in the sale of bunker coal upon terms of a reasonable character. At present coal for bunker purposes may be obtained either at Cristobal or Balboa; that is, either at the Atlantic or at the Pacific terminus. At Cristobal coal is being sold at $5.15 and $5.40 per ton, the second price being for fuel trimmed in the bunkers. The cheaper price may be obtained by taking coal in from railroad cars alongside the wharf by the use of the ship's own gear. A steam hoist and crane may be utilized, but a charge of $1 per hr. is made for the use of the apparatus. Lighters are ordinarily used when coal is delivered and trimmed for the higher price.

STEAMER BEING TOWED BY ELECTRIC LOCOMOTIVE ON EACH SIDE

At Balboa, the prices are $6.40 and $6.15; but no handling apparatus is now available at this point. The foregoing prices are those established by the Panama R.R. It is recognized that a flat rate for all comers is inequitable. Some ships have bunkers easy to reach and easy to fill and trim; others have bunkers which present great difficulties; there will also be intermediates.

Furthermore, it is quite possible that the railroad feels that its short experience has resulted perhaps in a loss on the trimming, even on the average. The railroad was paying $2.70 for coal at Hampton Roads. The freight cost to the canal was $1.395. So that before the cost of storage and handling was added, the coal cost $4.095 at the Atlantic terminus. Some profit was naturally desired. The $1 excess in the price of coal at Balboa was due solely to the canal tolls and not in any degree to the additional transportation. Whether this $1 really covered the tolls seems to be in doubt. There is uncertainty on this fundamental matter because of the difference between practice and theory in the effect of the measurements of vessels.

CANAL CHARGE PER TON VARIES WITH VESSEL

Commercial vessels going through the canal pay $1.20 for each displacement ton of available cargo space, if the vessel carries any cargo whatever; and $0.72 for each displacement ton, if the vessel is in ballast. A collier going from Norfolk to Balboa and returning empty will be subject to both tolls, so that the coal will have to pay the total.

A displacement ton is 100 cu.ft. of space—that is, of cargo space. This may sound very simple; but in practice the determination of what is and what is not cargo space is not only difficult, but practice differs. Until a vessel has been actually measured under the rules of the Panama Canal it is ordinarily impossible to tell what the tolls will be. Measurement by other rules affords rather an uncertain guide. Probably the closest approximation to the Panama rules are those in force for the Suez Canal. The relation between the actual carrying capacity of a Norwegian tramp and its toll charges will be quite different from the relation between the same items for an American-built vessel.

Theoretically one could allow 43 cu.ft. for 1 ton of coal, and so expect to pay 43 per cent. of the round-trip toll charge of $1.92 per displacement ton. This would indicate that one ton of coal would have to bear a toll charge of $0.826. But the Panama R.R. was not clear that $1 covered it.

The uncertainty as to the relation between Panama Canal measurements and actual coal-cargo capacity is important enough to warrant the consideration of some actual examples. In making comparisons, I assume that the cargo actually on board when a ship makes the passage of the canal is approximately her real capacity. It seems reasonable to assume that shippers are going to put on board all they can.

At the end of September 1914, the "Vimeria," American registry, passed through the canal on her way from Norfolk to San Francisco with 8,340 tons of coal.

The net Panama Canal tonnage was 4,754. That is to say, the amount of coal on board should have been 475,400 divided by 43, or 11,058 tons. The amount of coal capacity should have been about 2.3 times the net canal tonnage, whereas it was actually only 1.8 times this figure.

Take another case: At the beginning of October, 1914, the American-registered vessel "Neches" from Baltimore passed through for San Diego with a cargo of 6,000 tons of coal. The net canal tonnage was 4,113, so that her cargo was really only 1.5 times her rating instead of 2.3 times. We might expect some discrepancy, but a comparison of the two examples will show that there is probably no fixed ratio between net canal tonnage and cargo capacity.

Consider a ship flying the British flag: Close following the "Neches" came the "Bankdale," British registered, with 5,943 tons. She sailed from Norfolk for Guaymas, Mexico. Her net canal tonnage was 3,637, so that she carried 1.6 times her canal rating. This is better than one of the American vessels and worse than the other.

Take another British case: "The Crown of Toledo" sailed out of Glasgow for San Francisco laden with 6,499 tons of coal, presumably British coal. Her passage through the canal was made about Oct. 19, 1914. Her canal tonnage was found to be 5,438. This makes her cargo only 1.2 times her canal rating.

Another case where the ratio is very low was furnished by the Peruvian vessel "Uruhamba," which made the passage in November, carrying 2,000 tons of coal from Cardiff for Mollendo. Her canal rating is 3,168—actually more than the cargo capacity as that capacity is to be judged by this cargo. The ratio is 0.63, which is not within gunshot of 2.3.

The fuel now being supplied for bunkering comes from the coal region in and around New River; that is, from southwestern Virginia and the neighboring district of West Virginia. The Panama R.R. has already contracted for some half million tons of this coal. The specifications are as follows:

Moisture, delivered coal, not more than	3%
Ash, dry coal, not more than	7%
Volatile matter, dry coal, not more than	21%
Sulphur, dry coal, not more than	1¼%
Fixed carbon, not less than	70%
British thermal units per pound, dry coal, not less than	14,700

Coal will be accepted where the thermal content per pound is as low as 14,400, but at a discount of ¼c. for each 25 B.t.u. or fraction thereof which may be lacking. The railroad may reject coal falling below 14,400 B.t.u. or accept it with an additional discount of double the former for the deficiency below 14,400. If the coal analyzes (the Bureau of Mines being the judge) less than 14,300 B.t.u., on a dry basis, and the railroad is compelled to accept the shipment because of its departure for the canal before receipt of the analysis, an additional penalty of 10 per cent. on the contract price is to be imposed.

The penalties indicated have in view the delivery of coal fully up to the desired thermal content of 14,700 B.t.u. In short, the railroad wants about the best steam fuel that can be supplied in quantity by American mines. The result will be a worldwide introduction of our premier grade of steam coal.

Drag Car for the Man Trip

By Ralph W. Mayer*

SYNOPSIS—If safety drags are applied to one or more ordinary cars composing a trip, they will probably stop the trip in case of accident, but will probably also derail the cars. To prevent this a special car, properly weighted, may be equipped with drags which are easily raised or lowered.

The Northwestern Improvement Co.'s Mine No. 6, of which Peter Bagley is superintendent, has installed a drag car instead of the drag usually placed on the last car of the man trip. While the ordinary drag would stop the trip if the rope or coupling broke, it usually would result in the derailment of several cars and the possible injury of some of the men upon them.

The use of the drag car eliminates this, and the cars stay on the rails. An ordinary mine car upon which four drags are placed is used. The drags can be made from pieces of light steel rails, pointed on the trailing ends. They are hung from the car axle by means of clevises or pieces of strap iron, bolted or riveted to the drag after passing around the car axle.

Two drags are placed on each axle, next to the car wheels, so that they will touch the ground near each rail, on the inside of the track. The drags in each pair are connected by means of two ¼-in. iron rods, one near each end of the drags.

Eye-bolts are secured in the drags and the connecting rods fastened thereto by means of eyes or rings on their ends. This allows freedom of movement between the various members and permits each drag to move up and down independently of its mate, but restrains its sidewise movement.

Near the middle of each drag a hole is drilled and a chain connected by means of a clevis and bolt. A hole, 2 in. in diameter, is bored in the bottom of the car, directly over this clevis, sufficiently large for the chain to pass through without binding or catching.

A 6-in. iron pipe, reaching about 8 in. above the top of the car, is securely fastened to the car bottom, with this hole in its center. This pipe may be fastened by means of angle-irons and bolts or by heating the end of the pipe and splitting it, bending the split pieces out at right angles and bolting them to the car bottom.

A 2-in. pipe is set directly over the hole in the car bottom and inside the 6-in. pipe. It is securely held in position by wooden wedges driven between it and the 6-in. pipe, care being taken to center it over the hole in the car bottom. The 2-in. pipe should be shorter than the 6-in., the difference in their lengths being about equal to the height of the car bottom from the tops of the ties or roadbed.

The chain from the drag is led up through these pipes, and a 4-in. ring is fastened to its end. When the drag is touching the ground, this ring is inside the 6-in. pipe and resting on the end of the 2-in. pipe, which prevents it from getting out of reach and keeps the end of the chain inside the car.

A slot is cut in the top of the 6-in. pipe, sufficiently wide and deep to accommodate a chain link edgewise. This slot is placed in the side of the pipe next to the side of the car, for convenience in handling the chain.

---

*Roslyn, Wash.

When it is desired to raise the drags for descending the incline, the chain is lifted out of the 6-in. pipe and pulled taut, raising its drag against the car bottom. A link of the chain is then dropped edgewise into the slot on the end of the pipe. The next link of the chain, being sidewise, is too wide to pull through the slot, and the drag is held up in a position well off the ground.

When the bottom of the slope or incline has been reached and it is desired again to bring the drags into action, it is only necessary to raise the chain out of the slot and let it drop inside the 6-in. pipe.

The car is filled with scrap iron and sand to give it the necessary weight, while it is covered over with 1-in. boards nailed flush with the top of the car. Its appearance will be much improved if it is painted and "Safety First" is stenciled upon the sides and top. The moral effect which such a car has on the men is worth considering, although the saving in time over the old method and the increased safety that results make its adoption worth while.

A low reel is placed on the front end of the car to hold the ½-in. cable which passes around the trip when hauling men. This cable, which is provided with a hook on each end, is carried forward on each side of the man trip, and the hooks are attached to a link of the chain on the end of the haulage rope.

This light cable passes around all the cars, and should a coupling break it would prevent a runaway. The cable should be short enough to fit snugly to the cars, yet not take any of the pull off the couplings, so that if the latter should break, the cars would not acquire any appreciable momentum before being caught by the cable.

This cable is held off the ground by means of hooks made from ¼-in. round iron. These are formed like an elongated letter G, the top end being slipped over the side of the car and the cable laid in the lower end or hook. Two hooks to the car, one on each side, are usually sufficient.

These hooks are kept in a box on the drag car when not in use. After the men have all been hoisted or lowered, the cable is reeled up, the hooks are placed in the box, and the car is side-tracked ready for use when again needed.

Record of Coke Works in Connellsville Region

The following tables, which constitute a complete directory of the coke manufacturers of the Connellsville region, were compiled by *The Courier* of Connellsville, Penn., and have been revised and corrected to June 1, 1915.

CONNELLSVILLE REGION

This Way Out!

Written Expressly for Coal Age by R. T. STROHM

We're not just sore on the breaker,
  With its jarrin' an' its noise,
But we're mighty sure that it makes a poor
  Sort of job for a bunch of boys.
It ain't that our backs git tired,
  Or we hate the dusty air;
But we dassent shirk when the mine's at work;
  We've got to be right there.

In spring, when the season opens
  For the black bass an' the trout,
The green earth calls through the breaker's walls
  An' invites us fellers out.
An' then, for a day of fishin'
  We would sell our precious souls;
But no one goes—till a sly guy throws
  A switch-point in the rolls.

What's more, in the heart of summer,
  With the sun a-peltin' down,
The posters flare an' the trumpets blare
  An' the circus comes to town.
But we never git to see it,
  For we're busy pickin' coals—
Unless some friend takes a chance to send
  A switch-point through the rolls.

Perhaps it's a red-hot finish
  In the bush-league pennant race,
An' the home boys need just a game to lead
  An' to land in the highest place.
We know where the ball-park's fences
  Show a hundred chinks an' holes;
So no one grieves when an unknown heaves
  A switch-point in the rolls.

⁂

Normal Production in Iowa

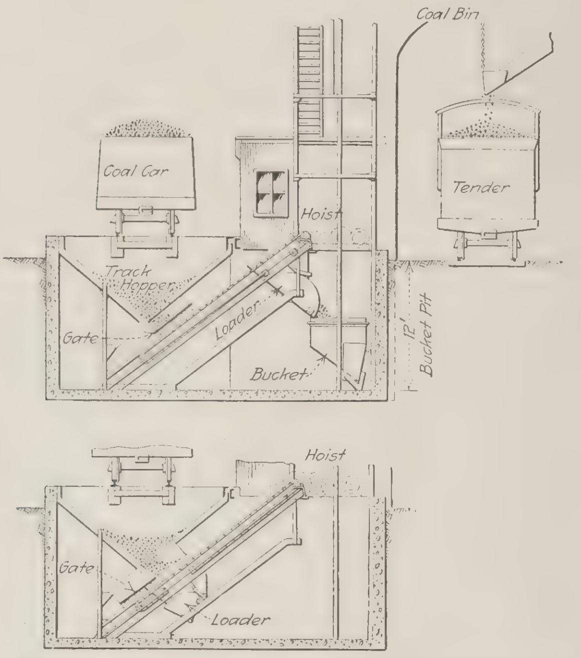
Coal production in Iowa in 1914 showed a decrease of 1 per cent. as compared with 1913, the output in 1914 being 7,451,022 short tons, valued at $13,364,070, according to figures of the Geological Survey. The number of men employed in the mines of Iowa increased from 15,757 in 1913 to 16,057 in 1914, and the average number of working days increased from 195 to 204.

Iowa is no exception to the states of the interior in which powder mining by shooting from the solid is practiced to a reprehensible degree, and the record in that respect in 1914 is worse than in either 1913 or 1912. The quantity of coal shot off the solid in 1914 was 5,545,842 tons, or 74.4 per cent. of the total; in 1913 it was 72.3 per cent., and in 1912, 69 per cent.

Shallow-Pit Coaling Station

A new design of coal-handling plant for railway coaling stations of the elevator-bucket type has a bucket pit only 12 ft. deep. This reduces the cost of the underground work and may preclude trouble with water which would be encountered with the deeper pit usually required where the coal is fed by gravity from the track hopper to the elevator bucket.

The special feature, as shown in the accompanying drawing, is that the coal is led through an undercut roller gate to a traveling loader, or bucket. This loader runs up inclined guides and dumps the coal into the elevator bucket, which in turn delivers it to the elevated bin in the usual way. The loader is of 2½ tons' capacity. It is geared to the automatic electric hoist that operates the elevator bucket, and the movement of the loader effects the opening and closing of the gate. This coaling plant is manufactured by the Roberts & Schaefer Co., of Chicago. —*Engineering News.*



MACHINE FOR COALING SHIPS AT WORKINGTON HARBOR, ENGLAND

⁂

Indians Predict Cold Winter

The old-time Indians of the Southwestern States are prophesying an unusually long, cold winter this season. They say that the squirrels have already begun storing up goods, the bark on the trees is thicker than ordinarily, the summer has been abnormally cold and wet, the migration of birds started very early and numerous other signs which according to the aborigines never fail all go to forecast a winter of unusual severity.

It is noticeable that the full-blooded Cherokees in the Spavinaw country of Oklahoma are making extraordinary preparations for winter. For the first time in years they have stored up a surplus of fuel and food and are advising their white brethren to do likewise.

Last fall the Mesa Verde prairie dogs deserted their villages in Colorado for new ones, and the Indians visiting that locality for trading purposes shook their heads over it all winter, and said, "Rain, much rain all summer." Their prediction in this case seems to have come true. Now they are of the opinion that a very cold winter is in prospect, because the deer are more plentiful than for years, while rabbits are so numerous that one can scarcely go about without seeing them in large numbers. Coyotes and mountain lions are also unusually plentiful, which may be explained by the abundance of small game on which they live. If these Indian predictions can be relied upon, the coal man will come into his own this winter.

⁂

More Anthracite Is Consumed in Hard-Coal Region

The increase in the amount of anthracite coal sold to the local trade and used by employees in the anthracite region of Pennsylvania, according to the latest annual report of the Department of Mines, is wholly disproportionate to the increase in population. If the amount of fuel consumed in the home is a true index of the prosperity of the region, it has prospered mightily in the decade from 1903 to 1913. The following table of the number of tons of anthracite sold to local trade and used by employees does not include the coal used at the collieries for steam and heat, which amounts to over 10% of the entire production:

Year	Tons	Year	Tons
1903	1,378,167	1909	1,805,284
1904	1,544,728	1910	1,868,369
1905	1,590,556	1911	1,990,093
1906	1,522,454	1912	2,160,096
1907	1,700,309	1913	1,943,238
1908	1,715,889		

It may be observed that there has been a steady increase in local consumption except in the year 1906, when there was a six weeks' suspension of mining while the operators and mine workers were negotiating a new agreement. There was no suspension in 1909 at the termination of this agreement, but in 1912 there was an increase in spite of the suspension. The winter of 1913 was the first of three successive warm winters, and there was a marked decrease in local consumption; but the total increase for the decade was 665,071 tons, or over 47 per cent.

⁂

The Life of Wood Pipe

D. C. Henny, a consulting engineer of the Reclamation Service at Portland, Ore., has made an investigation into the life of wood pipe on behalf of that service. His conclusions were published in *Engineering News* of Aug. 26.

The inquiry covered three general types of wood pipe—continuous wood-stave, sectional wood-stave and sectional-bored. The probable life of various kinds of pipe is as follows:

Wood	Condition	Years
Fir	Uncoated, buried in tight soil	20
Fir	Uncoated, buried in loose soil	4 to 7
Fir	Uncoated, in air	12 to 20
Redwood	Uncoated, buried in tight soil, loam or sand, and gravel	Over 25
Fir	Well coated, buried in tight soil	25
Fir	Well coated, buried in loose soil	15 to 20

When conditions are unfavorable to the complete saturation of the wood, the life of the pipe is materially reduced. Open soil and low water pressure make it certain that the wood will not be kept continuously moist throughout. But coating the pipe appears to give the same result as a tight soil cover, and in addition the tar used in the coat possibly acts as a disinfectant. Incomplete saturation has a most serious effect on redwood, reducing its life to 15 years or less.

The author reaches the following conclusions:

(a) Under favorable conditions of complete saturation well-coated fir may last as long as uncoated redwood.

(b) Either pipe will have a longer life when well buried in tight soil than when exposed to the atmosphere. A life of 30 years and over may be reached, if a high, steady pressure is maintained.

(c) Either pipe will last longer if exposed to the atmosphere than if buried in open soil, such as sand, gravel and volcanic ash. This greater durability will only be obtained in a hot and dry climate, when the pipe is shaded from the sun.

(d) Under questionable conditions, such as light pressure of partly filled pipe, fir, even if well coated, may have only from one-third to one-half the life of redwood.

(e) Under light pressure the use of bastard-sawn staves in fir pipe should be avoided.

(f) The use of wooden sleeves in connection with wire-wound pipe is objectionable and has caused endless trouble and expense. It is possible that the objection may be partly overcome by dipping the ends of the sleeves in creosote and by applying to them a heavy coating of tar. The sleeve wood, however, will never be as perfectly saturated as the straight pipe, and full creosote treatment of the wood or else some form of metal sleeve, either riveted iron or steel, heavily coated, or cast iron will probably be well worth the extra cost.

(g) If wooden sleeves are employed on pipe from 10 in. up, they should be provided with individual bands to permit the taking up of leaks.

Wood pipe should not be used unless it can be kept full and under pressure during periods of use. The coating cannot under such conditions be expected to afford protection against decay. The coating should be continuous and heavy, and to be fully effective should be not less than $\frac{1}{16}$ in. thick, and it should preferably consist of more than one individual coat of a mixture of asphaltum and tar, or of an application of gas tar followed by one or more layers of refined coal tar. Little experience, however, can be quoted in support of all-tar coating.

⁂

Steam Shoveling in Alberta

Alberta has 85 per cent. of the coal of Canada and [illegible]0 per cent. of all the coal in the British Empire, according to a geological statistician. One-sixth part of the coal of the entire world is in Alberta. In the past 20 years 20,000,000 tons have been mined, and if continued at this rate, the supply would last 1,072,000 years. At the rate Canada is now using coal, Alberta could fill the demand for 100,000 years. If the world's demand for fuel did not increase, that province could supply the coal needs of both hemispheres for one hundred years and still there would be fuel on hand.

The estimator took into consideration only the known fields of today. There are stretches in the northwestern and extreme northern parts of the province that as yet have not been thoroughly explored. Most of the coal is a bituminous fuel of high grade and well-suited for battleship use. During the past year D. A. Thomas, the great coal operator of Wales, spent some time in the north country and sent out half-a-dozen survey parties into the as yet unknown regions of Alberta. It was stated at the time that the Thomas interests were directly connected with the British Admiralty.

While the coal of Alberta is mined in general in the usual way, there is one point in central western Alberta where strip-pit mining is practiced. This is in the neighborhood of Tofield, a small town upon the new Grand Trunk Pacific Ry., not far from the cities of Edmonton and Strathcona. Here the coal outcroppings appear in many places right on the surface, dipping gradually below the plain. The coal is of much better grade than is generally found lying so near the surface.

TAKING COAL OUT WITH WAGONS AFTER EXCAVATION GOT TOO DEEP FOR SHOVEL

In this district the farmers nearly all have mines of their own, from which they get their supply of domestic fuel by pick and shovel. Near the town several companies have gone into the business on a larger scale. A steam shovel has been installed, and as will be seen, the seam is followed to a considerable depth.

⁂

Pulverized Chalk, Slack and Solidified Tar have been used as fuel in Canada after being compressed into briquettes the size of an egg. They burn freely without smoke and have a high calorific value.

⁂

Coke-Breeze Briquettes have been made successfully in Germany by the compression of the breeze after the addition of finely divided hard pitch, the whole being heated from 300 to 400 deg. C. Experiments with other binders such as thick and thin tar with additions of sawdust and coal dust failed because the briquettes ignited with too much difficulty.

⁂

Impure Carbide gives out small quantities of phosphureted hydrogen and hydrogen sulphide on being dampened, and these gases have an unpleasant odor, but they are not generated in sufficient quantity to be injurious to health. The gases burn with the acetylene generated, and the residues are harmless. The odor of the carbide is largely owing to its impurities.

Editorials

The Colliery Engineer Consolidates with Coal Age

The Hill Publishing Co., owner of *Coal Age*, has just purchased *The Colliery Engineer*, and commencing Nov. 6 the two journals will be combined and appear as a single paper, constituting the greatest weekly in the world devoted to coal and coke.

As a result of this combination, the readers of both papers will be benefited. Those who have read only one of the two journals hereafter will receive all the information and news the industry affords instead of only a part. Those who have subscribed to both papers will in the future effect a saving in money and time through the elimination of a considerable duplication.

The plans and scope of the new weekly will be modified and enlarged through the retention of all that was best in both papers, while at the same time new features will be inaugurated that could not have been attempted by either periodical alone.

A complete announcement of the hopes and ambitions of the editors of the new journal will be printed in the first issue of the enlarged weekly Nov. 6, at which time let us all, not only the editors, but all the friends and readers of *Coal Age* as well, greet our fellow-workers in the industry with warmest hospitality.

Living no longer as two families, the readers of the greatest weekly and the oldest monthly can feel additional security in the added strength that will now carry the unified papers through good times and bad. The result will be a vehicle that will have power to do more for the industry than both papers could ever have accomplished singly.

⁂

Gentlemen, All

At the banquet of the Nanticoke Mining Institute, held at Nanticoke, Penn., Oct. 16, Congressman John J. Casey received no little applause at his assertion that the anthracite strike would be avoided if the employers and employees would sit down and discuss their differences amicably, realizing that there was really no necessity for a suspension or a strike.

And clearly the making of a new contract should not be the occasion of bitterness. When two men who have contracted with each other in the past, one as a buyer and the other as a seller, meet to make a new bargain, there is no rancor. They often sit down and take a meal together, and their differences of viewpoint are harmonized by the effect of an excellent cuisine. Even the Arab knows that two men who eat together think in harmony.

But the miners and the operators meet to quarrel, and of course they succeed. There is trouble in the air, but there should not be. Antagonisms are capable of causing the failure of nearly all institutions. Even our own Federal Constitution is overlauded. We are told it keeps us free and happy. But if our people were filled with hatred and suspicion of one another, if our motives were of the lowest, the Constitution would inevitably fail to secure its own existence; much less would it afford us liberty and justice. The document, like all others, is less noble than the people who wrote it and who have later to defend it.

And it is so with any instrument framed to keep miner and employer in happy harmony. The contract between them is nothing unless it is an agreement between gentlemen, an understanding interpreted with friendliness and tact. There is in fact no room in a democracy for anyone but a gentleman; for when all men are equal, the personal restraint of each man is about the only assurance that even a single individual will receive his full rights.

It was interesting to hear Con Cole, a street-car motorman, mimic a miners' convention at the institute meeting and draw laughter from miners and operators in the sallies he made at the expense of both. This wage controversy is not an occasion for bigotry, and no gentleman is a bigot. It was a pity Con Cole could not also hold up to ridicule a body of operators engaged in the English sport of "viewing with apprehension." There is nothing more amusing than to meet a lot of operators and superintendents discussing the labor problem, unless it is to hear a number of workingmen canvassing the same subject.

Both may be expressing apprehension at the course affairs are taking, but surely both are giving good cause for such fears of the future. The only way to solve the mine-strike question is for miners and operators to get together and learn one another's views and put the quietus forever on partisan oratory. The crudity with which operators and miners alike try to suppress adverse opinion is deplorable. The matter of wage scale is an economic question to be debated scientifically. The choleric gentlemen, if gentlemen they can be termed, had better withdraw and leave the parleying to those who are willing to acknowledge the rights of the opposing party.

Of the rabid mine owner and the equally rabid mine worker it may be well said with Shakespeare, "A plague o' both your houses!"

⁂

Reducing the Water Problem

Many mines are more troubled with water removal than is necessary because no attempt is made to prevent it from reaching a lower level than the opening, or from passing to some point which, though higher than the mine entry, is yet so low that the water has to be pumped out.

There are many opportunities to impound water at a high point and pipe it to the mine mouth. On its way to that entry it may pass lower elevations than its point of delivery, but like the water in a city water-supply, that drop in the line will not prevent the water from being delivered by gravity to the elevation desired.

Even when water has to be pumped from a dip, it is not uncommon to pump it over one small elevation and let it run downhill to another depression from which it must be pumped again. A continuous pipe through the second depression would have delivered the water to a point from which it would have traveled to the surface without further handling. The difficulties of handling mine water can usually be marvelously lightened when a good profile map has been constructed.

The minor depressions of an upper seam may not be coincident with the dips in other beds below, and it is well to keep this fact in mind. An undrainable point in one measure may coincide with an area in a lower with ample drainage facilities, and a borehole will take advantage of that fact.

The minor folds are the result of world stress when the beds were laid down or shortly after. They are usually different or slightly different with every bed and should not be assumed to be of the same character until the similarity is duly proved. A little care in selecting the drilling point may turn the trick. Even when two seams have their bathodic points immediately over one another, there may be a place in the upper seam which, if dried by drilling, would practically remove water from the whole upper dip, and this place may be beyond a dividing ridge in the lower bed and so may furnish the ideal spot for a borehole from the upper measure to the lower for drainage purposes.

Where a lower seam has been worked out, relief can be obtained in the upper by the process of drilling. It will be a matter of no interest then whether a low or a high spot in the lower bed is penetrated. The water will drain off in any event through the open places in the falls.

Drilling Sometimes Affords Drainage

Drainage into limestone crevices has been often advocated. Unfortunately where there are limestone and crevices there is often much water, and the practice of making a short hole or a well to the cretaceous stratum may make more trouble than it removes. But if a plug is kept handy when the hole is drilled and the driller is a man who does not fear a wetting, the risk is worth trying, for if conditions are unfavorable the hole can be plugged, and if they are propitious the water can be drained off.

There are wonderful possibilities of shutting off water from the surface by piping and fluming water past certain places where otherwise it would be engulfed. It must be remembered that water enters the mine not only through caves, but also through the open strata, and oftentimes a little care will make a wet measure dry. Sometimes a little carelessness in impounding water near a mine will make a dry mine wet and a water reservoir dry—a combination most trying to a superintendent.

The use of V-drains around falls is not as common as it should be, necessary as such drains are, and in wooded country little care is taken to protect such slight sinkages and cracks as may not yet have developed into caves, but which are already large enough to admit the water to the mine.

All this water passes to the surface eventually; the sooner it passes the more acid it is, for the sulphuric acid does not have time to become neutralized by alkalies. The less water there is to handle the longer the water may remain in the sumps for settlement. The water will then be heavy with ferric hydrate perhaps, but acid free. The hydrate is harmless and if necessary can be allowed to settle. The acid is the harmful constituent, and if the water remains long in the sumps it is quite likely to be so purified of acid as to be less harmful to pumps and boilers. Larger bodies of water cannot be impounded and are liable to do the maximum injury to engine and boiler parts. Probably a little lime dropped in a sump occasionally would make the water less harmful to equipment.

⁂

Mechanism of Thrift

Many of our national difficulties are of our own making. It is largely our fault that all our savings are the outcome of the rich man's profits rather than of the poor man's economies, for in most cases a miner or village industrial worker would have to take a whole day and spend a day's earnings if he wanted to bank his biweekly pay. The banks at such towns as are exclusively devoted to mining are few indeed.

Banks are usually started by business men who generally establish these institutions in their home towns. Hence the big cities have perhaps altogether too many of them and the villages only too few. Many of the foreigners are banking with irresponsible persons, though the stricter state laws are breaking up the business of these fly-by-night institutions. Yet in many places nothing adequate has been provided to replace them.

The wage roll of the mines, according to the Federal census of 1909, was $412,898,346. Of course some of this money was paid to men who live in sizable towns where banks are numerous. But in such places they are swell institutions to which the miner might well hesitate to go in his mining clothes and where, rightly or wrongly, he does not care to enter even when dressed up. He looks at the city or borough bank as a place for the rich.

As a result, even when they live in towns provided with banks, these men do not save, and the nation is deprived of the capital which they should accumulate. Thrift is discouraged, and the workman is blamed for faults of improvidence with which he is not rightly chargeable. But it will be said the Government provides a way of laying aside earnings, and that is true. Still the red tape at the post office makes the placing of savings with the Federal Government unpopular. A bank which will take money from the miner without his filling any application and will give him a receipt, even if he hasn't his bankbook with him, will be sure to do a good business, as soon as confidence is established.

In the mining village there is a large source of capital going to waste. If the miner can save 10 per cent. of his earnings, the aggregate will amount to $40,000,000 per annum, and that will furnish capital for a number of strong banks. Where they are established, miners are known to bank $5 and $10 per payday with unfailing regularity, even when the mines work irregularly, and the money once deposited is rarely withdrawn, for saving men usually do not migrate as readily as the unthrifty.

But banks at mining towns will not have to depend solely on the miners. They will be sure to draw agricultural deposits wherever the ground in the neighborhood is fertile, and the business derived from the small stores and local industries will tend to add profit and opportunity to the mine bank.

The National Bank of Ellsworth, Penn., is an example of such a successful institution. The time deposits amounted last September to over $147,000 and the deposits subject to check to nearly $59,000. There were only about 1,100 men employed by the company at Ellsworth and Cokeburg. So per man there was $134 of deposits on time certificates and $54 of deposits subject to check. This is evidence that a good bank with a fair capitalization and a safe surplus can do a satisfactory business in any mining town.

The children in the Ellsworth schools alone have deposited $2,000 in the bank. This institution pays 4 per cent interest and compounds it quarterly. The total resources make the respectable showing of $275,619.05.

Only when the workingman invests his money will he defend the rights of investors; only then will he realize that the profits of investment are not outrageously high. We need also, as life-giving blood for our industries, the contributions of the workingmen, and we deliberately overlook this source of the nation's wealth when we fail to provide banks at small industrial centers like our coal-mining villages.

Legal Department

Liability of Surety on Coal Sales Contracts

By A. L. H. Street[*]

There is a well-settled general rule of law that a surety for the performance of a contract is released from liability by the act of the principals to the contract in changing the terms of the agreement in a material respect that increases the danger of the surety being held liable. This rule was lately invoked by a surety company, which secured performance of a coal-sales contract, in a suit passed upon by the United States Circuit Court of Appeals for the Third Circuit (Pittsburgh-Buffalo Co. vs. American Fidelity Co., 219 Federal Reporter 818).

Plaintiff had a contract to sell the output of the Annabelle mines, and under a collateral agreement appointed J. K. Dimmick & Co. as its exclusive agents in New England territory and as nonexclusive agents in a certain portion of the Middle Atlantic States. Each party executed a $25,000 bond to secure performance of the terms of this agreement, defendant becoming the surety. Claiming that Dimmick & Co. broke their contract in refusing to accept further shipments, plaintiff brought suit on its bond. The surety company defended on the ground that this contract had been materially altered without its consent. Under these circumstances the Circuit Court of Appeals held:

That, since the secured contract concerning sale of Annabelle coal did not restrict the parties thereto against making other contracts for sale of other fuel, the fact that Dimmick & Co. contracted with plaintiff to sell other grades of coal and coke, without notice to the surety company, did not constitute such departure from the secured contract as discharged the surety company from liability under the general rule of law stated above.

That, for like reasons, the surety cannot complain because plaintiff shipped coal other than Annabelle coal into territory where the secured contract gave Dimmick & Co. the exclusive sale of fuel of the latter grade.

That whether plaintiff's act in accepting notes from Dimmick & Co. for the price of coal delivered under the secured contract, instead of observing a clause in the agreement requiring monthly settlements, constituted such departure as released the surety depends upon whether the notes were accepted as full payment and whether the change in the manner of payment injuriously affected the surety.

That since the secured contract did not prescribe any penalty for failure of Dimmick & Co. to take 50 per cent. of the output of the Annabelle mines, as provided in the agreement, any such breach merely entitled plaintiff to enter the firm's otherwise exclusive territory and sell coal in competition with the firm to the extent of the quantities which the firm failed to take, and such breach did not constitute a departure from the contract in the sense that the surety company was released from liability.

⁂

Recent Decisions

Right of Boss Trimmer to Recover for Injury—A boss trimmer is not entitled to recover damages for injury sustained in being crushed between the end of a coal car and a post of a tipple, resulting from his removal of a wooden block from a wheel of the car in moving the car in the process of loading, even though the car was of improper width, if he had authority to reject the car, or if the car was equipped with a sufficient brake by which he could have regulated movement of the car. (Michigan Supreme Court, Lewis vs. Wolverine Coal Co., 153 Northwestern Reporter, 26.)

Suit for Polluting Stream in Mining Operations—In a suit to recover damages resulting from defendant coal company's act in polluting the waters of a stream, spring and wells on nearby land in conducting its mining operations, it was not permissible for the defendant to show that in general the water in wells sunk near coal mines are impregnated with mineral, nor to show generally the kind of water found around coal mines. The effect of admitting such evidence would be to inject into the case collateral issues that would only in a very remote degree, if at all, shed any light on the main issues in the case. (Alabama Court of Appeals, Morton vs. Pratt Consolidated Coal Co., 68 Southern Reporter, 1015.)

Liability for Injury to Minor Employees Unlawfully Employed—When the employment of a minor is shown to be illegal, because forbidden by a statute like the Pennsylvania act of 1909, forbidding employment of boys under 16 in breakers, that in itself is sufficient evidence to charge the employer with actionable negligence, rendering him liable for injury to the minor sustained in the course of the employment. When sued for injury to a minor worker, the employer must justify the legality of the employment by proving that the employee was within the permitted age and that the employer had complied with all the statutory requirements in relation to the employment of persons of the age in question. If the law contains no provision by which the employer may protect himself, through certificates or other means, then he takes such workers into his service at his own risk, so far as their age is concerned, and a false statement by the employee in regard thereto will in no sense bar a recovery for subsequent injury. (Pennsylvania Supreme Court, Krutlies vs. Bulls Head Coal Co., 94 Atlantic Reporter, 459.)

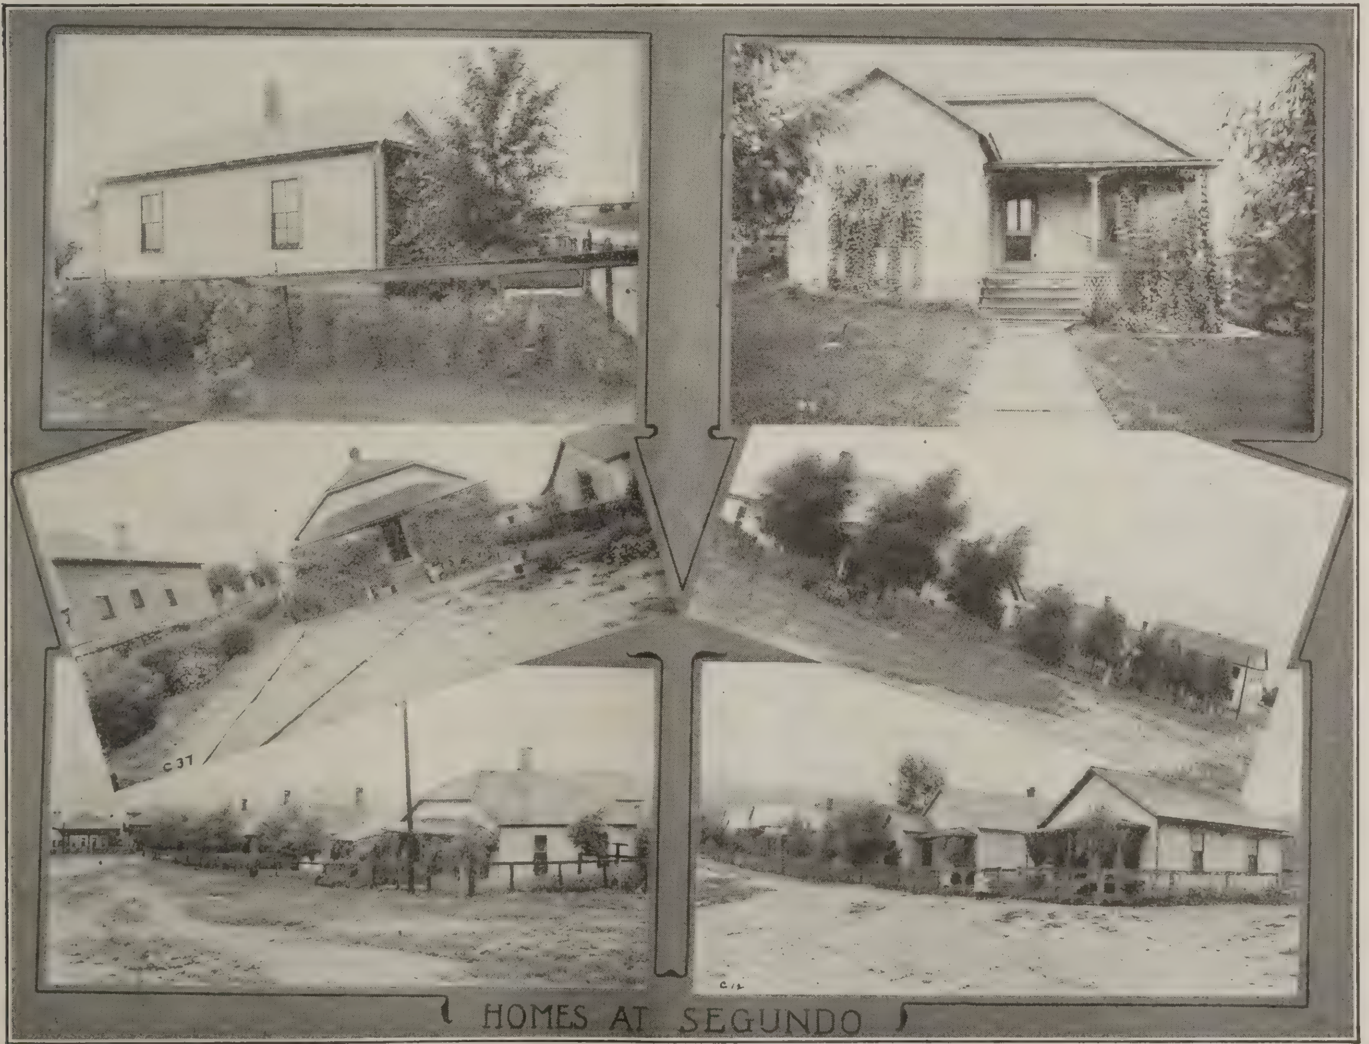
Colorado Fuel and Iron Co. Mining Villages

The Western villages are usually termed "camps" and probably in the earlier days they fully justified the name given them. But more recently there have been large improvements, and attempts have been made to supply ample water so that trees and flowers may be grown, and thus the permanent village has replaced the evanescent camp. Still if one looks at the views of the Colorado Fuel and Iron Co.'s houses at Frederick and Segundo, the uncompromising character of the ground will be noted, and the shrubs, creepers and flowers will reflect the care that has been needed and taken to embower at least the home, if the hills and the roadside must still remain unadorned.

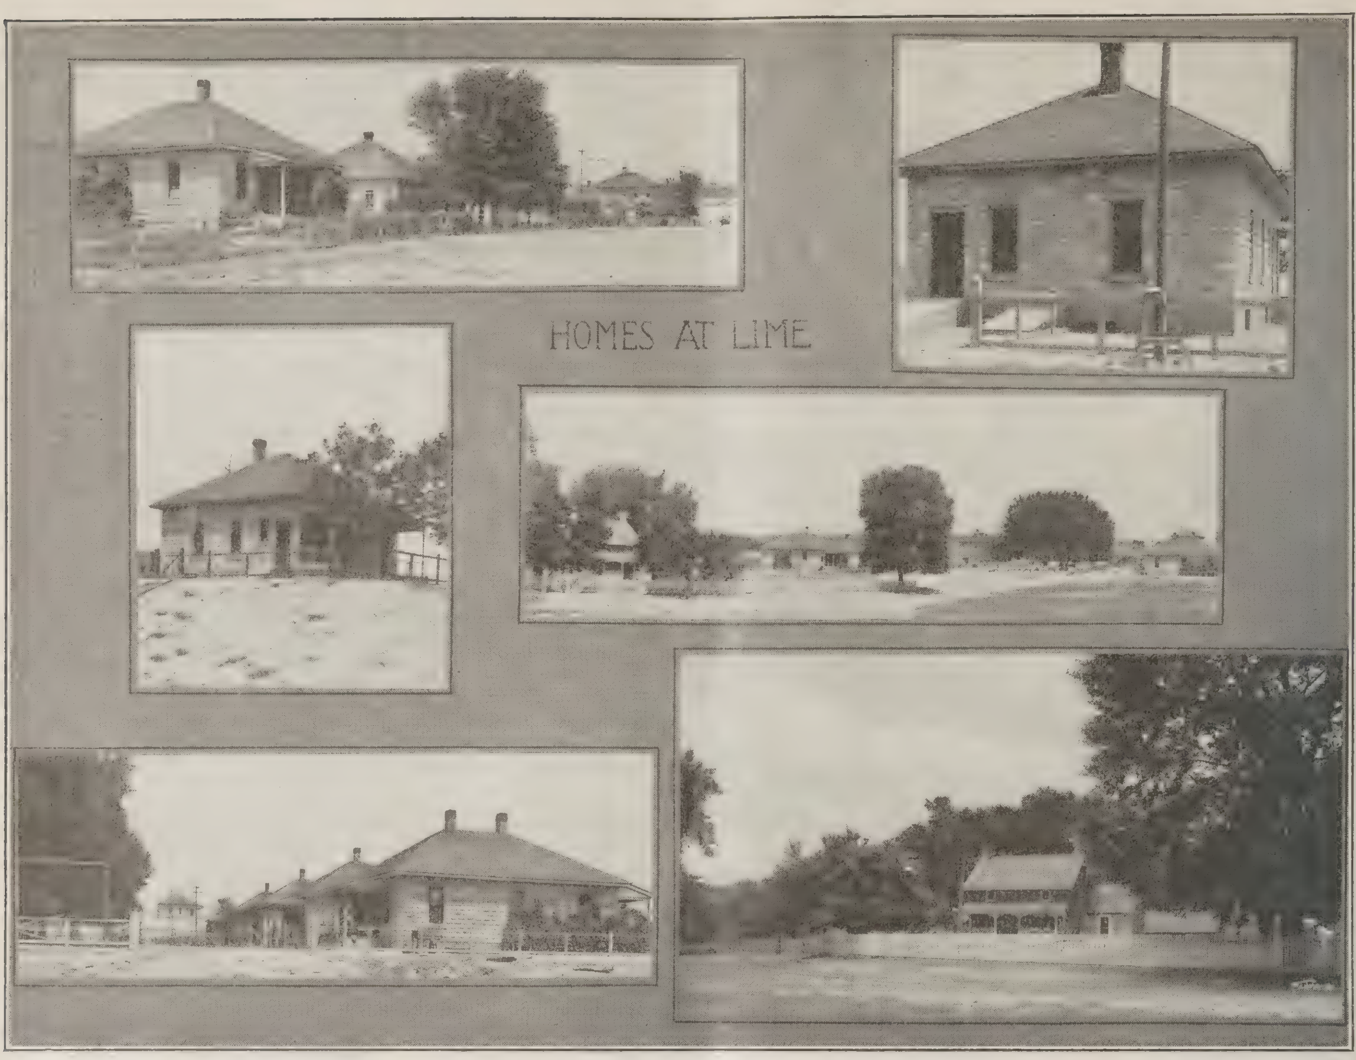
The limiting rent on these houses is $2 a room, which is higher than in the mining towns in the East by about 50 per cent.; but everything is expensive in the West owing to the long freightage, and in Colorado and Wyoming owing also to the poor quality and small size of the timber available. The rate of $2 per room seems quite general and justifiable in Colorado, Wyoming and New Mexico. But though the rent is higher than in Eastern mining villages, it is low as compared with that in incorporated towns and cities whether East or West.

A provision in the contract between the Colorado Fuel and Iron Co. and its employees stipulates that the rent shall only be limited to $2 per room when the building is without bath. The time is certainly coming when every miner will demand his bathroom and will be prepared to pay a larger rent to secure it.

The village of Segundo (or "Second"), here illustrated, is on Las Animas Creek, a branch of the Chicosa Creek, which itself empties into the Purgatory and thence into the Arkansas. The town lies about 14 mi. west of the small city of Trinidad, along the Colorado & Wyoming Ry. Lime, or San Carlos, near Pueblo, Colo., another village illustrated in this article, is not a coal town, but it shows well the ideals to which the Colorado Fuel and



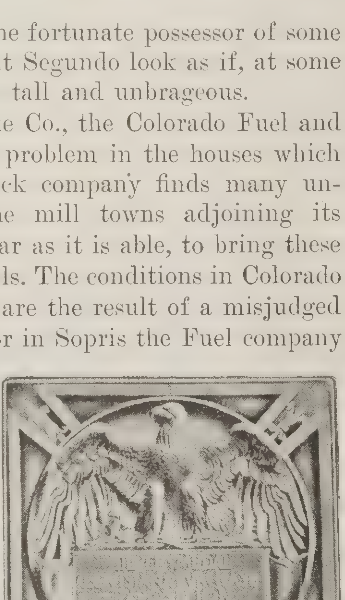
SEGUNDO, ANOTHER VILLAGE OF THE COLORADO FUEL AND IRON CO., ADJOINS PRIMERO ON THE SOUTH



AT LIME, OR SAN CARLOS, NEAR PUEBLO, COLO., THE COLORADO FUEL AND IRON CO. HAS BUILT SOME OF ITS HOUSES OF CEMENT BLOCKS INSTEAD OF TIMBER

Iron Co. is tending. It is the fortunate possessor of some really fine trees, and those at Segundo look as if, at some time, they may also become tall and unbrageous.

Like the H. C. Frick Coke Co., the Colorado Fuel and Iron Co. finds its principal problem in the houses which it does not own. The Frick company finds many unfortunate conditions in the mill towns adjoining its plants, and it is trying, so far as it is able, to bring these into conformity with its ideals. The conditions in Colorado are somewhat different and are the result of a misjudged policy in the distant past, for in Sopris the Fuel company is successor to the results of an unfortunate policy inaugurated some 30 years ago. Miners were allowed to rent land for little or nothing and were encouraged to build on it. The Central European laborers were not choice as to the manner of construction of the homes which they built, yet the company did not want to confiscate the hovels which these foreigners had erected.



SILVER MEDAL PRESENTED BY ST. LOUIS EXPOSITION TO THE COLORADO FUEL AND IRON CO.

So the plan, soon seen to be wrong, was hard to discontinue so long as the tenants desired its continuance. The company, while legally free of responsibility, has determined to buy these shacks and put up desirable residences for the men. But it is likely that the tenants will imagine that the company cares nothing for their interests and is only anxious to secure the larger rent which the transference will make necessary. Sopris, by the way, is only about 6 mi. from the village of Segundo.

Alabama Safety Association First-Aid Meet

The Alabama Safety Association held its first-aid meet on Oct. 9. The winner of the white men's events was the Republic Iron and Steel Co.'s Palos Division team, with a score of 100. Second place was secured by the Woodward Iron Co. team from Dolomite, Ala., with a score of $97\frac{4}{5}$. In all there were 14 teams competing.

The Wylam Ladies' team was the only corps of ladies in the contest. They surpassed even themselves, and so took first prize, obtaining a percentage of $97\frac{4}{5}$. There were seven colored teams, and these had a separate competition, the first prize being awarded to the Alabama Fuel and Iron Co.'s Acmar Division team, which made a score of $95\frac{3}{5}$.

The physicians who judged the event were selected by the Jefferson County Medical Association, and most of these had attended first-aid demonstrations prior to the contest to familiarize themselves with first-aid methods. The judging was consequently well performed. It is interesting to note that the Palos team of the Republic Iron and Steel Co. defended its title as an efficient first-aid organization by taking first place.

Discussion by Readers

Correct Tipple Design

I have read the article entitled "Correct Tipple Design" by M. L. Hyde, *Coal Age*, Sept. 18, p. 450, with much profit and appreciation. Nevertheless, in spite of Mr. Hyde's assurance that the methods and designs given are the best, I think there are some minor points on which it is possible for a difference of opinion to exist.

In the first place, I question whether it is good practice, in mines having a capacity of 600 tons per day, for the topman to act as lampman. Subsection 4 of sec. 124 of the Mines Act of the Province of Alberta states that "the bankman shall not leave the top of the shaft while men are ascending or descending same." Subsection 5 of sec. 113 of the same act states that "every person receiving one or more safety lamps before going on shift shall personally return them at the end of the shift to the lamphouse." I would ask, How is the bankman to see that every man returns his own lamp if he must act as topman as well as lampman? And how is he going to carry out subsection 4 of sec. 124 if he must be in the lamphouse giving out lamps to the men?

Then, again, the check system outlined in this article would seem to present some minor difficulties, though no doubt these could be overcome. Suppose a man while in the mine loses his light and, being unable to relight it, obtains a spare lamp. On going off shift he puts his check on the spare lamp instead of his own lamp. If he fails to hook his check on his lamp, he cannot get the lamp in the morning. Because he has failed to do this his check is not on his lamp and it cannot be located in the hurry of the topman in giving out lamps and caging the men at the same time.

There has been a good deal of literature written on the subject of spontaneous combustion, but I have never before read the statement made here that "waste from the tables is not liable to spontaneous combustion," etc. It seems to me that bone coal picked from the picking belts is liable to ignite spontaneously. As a matter of fact I have seen bone from picking tables ignite spontaneously. In the Lethbridge district the bone is more liable to spontaneous heating than the coal, and a little coal mixed with the bone is even more liable to spontaneous heating than either the bone or coal separately, and this mixture is what there would probably be in the bin under the picking tables.

I am rather inclined to think that 36 in. is a little too low for lights over a picking table. The pickers at most mines use picks to separate bone from any large lumps of coal, and the use of picks with lamps at this height would be liable to cause an unnecessary breakage of lamps. The distance apart of the lamps is not an arbitrary distance, such as 4 ft., but should be governed by the candlepower of the lamps used.

I certainly agree with Mr. Hyde that self-dumping cages are superior to other methods; also that there is a large amount of breakage in a weigh-pan. Nevertheless, I doubt if even steel cars could be kept with a dust-proof door, without a prohibitive cost for repairs. I am afraid that the "few dollars higher" cost would be found to be a very serious consideration, especially if repairs were considered. I fail to see how we can use self-dumping cages in combination with the system given to obviate the use of a weigh-pan, unless the mine-car scales are located at the shaft bottom. This, I think, would be an objectionable feature and would make it difficult to get the miner's check number as the car is weighed. About the only method of overcoming the difficulty is that adopted by Mr. Hyde in his standard tipple (described in the second part of the article), which apparently has no facilities at all for weighing the coal.

Aesthetic design is undoubtedly a nice thing, but I would be willing to sacrifice a little beauty in order to have the resultant pull on the rope fall a little farther inside the back stay of the tipple than is shown in Fig. 1 of the standard tipple.

J. B. de Hart.

Coalhurst, Alberta, Can.

⁂

Efficient Mine Foremen

Letter No. 8—A man to be an efficient mine foreman must fulfill the various requirements of the state mining laws, with which he should be fully acquainted. He must possess some technical knowledge, besides having much practical experience in the business of coal mining, which will enable him to meet successfully the conditions and problems that arise in the operation of the mine and apply the proper means for their control and regulation, and to safeguard the property of his employers and the health and lives of the men in his charge. He must possess the executive ability and diplomacy that will enable him to overcome the perplexing labor troubles incident to mining, while at the same time maintaining a good balance on the right side of the ledger. His technical training should include a knowledge of the elementary principles of chemistry, mechanics and geology.

To many, this may seem an unnecessary array of qualifications for the position of foreman in a mine, but a little reflection on the wide range of subjects and the principles involved in the duties of a foreman will convince such that the statement is limited rather than exaggerated. If there is any one subject more than another with which a mine foreman should be familiar, it is that of ventilation. All practical mining men should know that the output of a mine can be increased 100 per cent. by efficient ventilation.

In conversation with mine officials, I have often asked questions in regard to the ventilation of a mine for the sole purpose of ascertaining how much they knew of the elementary principles involved. In most cases, these questions were asked of practical mining men who know how to effectively ventilate a mine, but have no knowledge of the principles on which such ventilation depends. In other words, they have never asked themselves why certain things produced certain results. No argument is needed to prove that greater effectiveness is gained, not only in ventilation, but in all branches of mining work in charge of the foreman, if that official knows why a thing is done as well as how it is done. To be most effective in any business, one must know the details of that business.

I may say that there is no industry that exhibits more effects of hidden causes than that of coal mining. Conditions and their effects confront the mine foreman on every hand, and the better he understands why these effects occur, the better he will be able to apply the most effective means for their prevention or removal.

I do not want to be understood as doubting the qualifications of a mine foreman who thoroughly understands how to ventilate a mine effectively. I only wish to emphasize how much more efficient is the foreman whose knowledge of the elementary principles involved in his work enables him to judge intelligently of the relative merits of the means he employs to accomplish certain ends.

In the ventilation of the mine, the foreman may be badly handicapped by inadequate means at his disposal for producing the required amount of air. Such a condition is not his fault, as he is seldom, if ever, consulted in reference to the design capacity or construction of the ventilator that will be best adapted to meet the requirements in the mine. These matters are wholly in the hands of the manager or the engineering department. But the efficient foreman can often make changes in the mine in regard to the plan of ventilation that will enable him to secure better results when the power producing ventilation is thus limited.

The subject of effective ventilation has been so emphasized in the Pennsylvania mining law that few, if any, mine foremen in the state fail to understand its value as a factor in the production of coal and the safety and health of the men employed in the mine. The point I would impress, in closing, is that the effectiveness of mine foremen would be greatly increased by a careful study of the simple principles that underlie our natural sciences and on which the work of mining depends.

⁂

Handling Explosives in Mines

Letter No. 2—I was glad to see the letter of James Thirtle, drawing attention to the need of greater care and caution in respect to the handling of explosive material in a mine. My observations lead me to think that much greater care is exercised in this regard in English collieries than in mines in this country. I beg to submit the following outline of the manner of handling explosives adopted by the Wigan Coal and Iron Co., at Leigh, Lancashire, England.

Magazine Is Well Protected

The powder magazine, which is located at a safe distance from the mine, is built of brick, has a strong iron door and is surrounded by an iron fence 7 ft. high. Both the door of the magazine and the gate in the fence are securely locked, except when the supply clerk in charge of the magazine enters to deliver the explosives required by applicants. Not more than 500 lb. of explosives is permitted in the magazine at one time, and no one but authorized persons is permitted to handle powder or detonators under any conditions. The system is as follows:

System of Handling Explosives

A shotfirer accompanies the supply clerk to the magazine, where he receives the required daily supply of powder and detonators from the clerk. The latter notes down in a book the amount of powder and the number of detonators given out, which enables him to know at any time the amount of each explosive remaining in the magazine.

The shotfirer, having placed the detonators in a metallic canister designed especially for their use and securely locked, delivers the canister to an official at the bottom of the shaft, who is authorized to receive the detonators and who counts them and notes the number thus received. Not more than 100 detonators are permitted to be kept in the mine at one time. The shotfirer then takes the powder he has received and places it in locked boxes, in amounts not to exceed 5 lb. in a box, in different places in the mine, where it will be convenient for his use. Not more than one box containing a supply of powder is permitted on a single split of air.

Firing the Shots

Having done this the shotfirer proceeds to examine each place in his district and ascertain the number of holes to be fired that day. Before quitting time the shotfirer goes to the bottom of the shaft and gets the number of detonators he requires in his district from the official to whom they were previously delivered. Each shotfirer must note down in a book the number of detonators taken out by him and the date when taken and sign his name. He must also examine and sign the mine examiner's report, observing carefully if any gas is reported in his district and where. No shot is allowed to be fired within 50 yd. of any place reported as containing gas, however small a quantity of gas may have been found, unless the gas has been removed three hours previous to the time of firing the shot.

All shots are fired by the shotfirer between shifts and when not more than 10 men are in the mine, which number includes the shotfirers and their assistants only. Having secured the necessary number of detonators, the shotfirer proceeds to charge and tamp each hole, using a wooden tamping rod and clay for tamping the shot. All shots are fired by electric battery and cable. Only one shot is fired at a time, the shotfirer carrying the battery with him when he goes to connect the cable with the wires of the detonator. The cable is of sufficient length to permit the shotfirer to reach a safe distance from the shot. Before firing another shot he must examine the place where the previous shot was fired and 50 yd. on each side of the same. Special precautions are taken when blasting on main-intake and main-haulage roads. The roads are swept clean of dust for a distance of 50 yd. on each side of the shot and well watered. All electric current is shut off from power lines at the surface when shotfiring is in progress below.

Treatment of a Misfire

A misshot, when found, is fenced off, and the person who drilled the previous hole is instructed to drill another relieving hole at the side of and at least 1 ft. apart from the misshot and 6 in. deeper. In order to show the direction of the hole and avoid the possibility of the drill striking the unexploded charge when drilling the relieving hole, it is customary to draw a line on the roof showing the direction of every hole drilled. When firing a relieving hole the shotfirer must first set a post near the shot, and having attached a piece of old cable to the detonator wire of the misshot, he fastens the other end of the old cable to the post. This enables him to trace and find the detonator cap if this is not exploded when the relieving shot is fired. The missed detonator, if found, is taken outside by the shotfirer and delivered to the superintendent, who tries it again with a special battery kept in his office for that purpose. This is done to ascertain whether or not the detonator was perfect.

When the shotfirer has completed his work, he notes down in a book the number of shots fired, detonators used and the number of misshots, if any. The book form is somewhat as follows:

Detonators				Shots				
On Hand	Delivered	Returned	Balance	Coal	Roof	Missed	Date	Sign
100	30	0	70	25	5	0	10/23	F.B.

Every shotfirer undergoes a period of training as an assistant to an old experienced man, and he is not permitted to fire any shots on his own judgment until he has had the experience that will permit him to judge correctly of the quantity of powder required in different shots, depending in each case on the nature of the coal and the position of the hole. Such precautions as these, if followed in mines in this country, would make blown-out shots and accidents from blasting coal a thing of the past. JACOB RILEY.

Universal, Ind.

Prohibition and Welfare Work

Letter No. 5—I have read with deep interest the several letters written on this subject. I believe the question of prohibition is worthy of the most careful consideration by all mine officials and miners who desire better conditions in and about the mines.

LIQUOR AND THE SAFETY-FIRST IDEA

The liquor question in mining is closely connected with the safety-first idea and all efforts for betterment of mining conditions. It is strange that men who believe that the safety-first movement is the best thing that even happened will close their eyes to the sale and use of liquor in the camp. Even where a saloon is not permitted in a mining town, a "sminkey" or "speakeasy" is to be found. I would ask, What is the use of urging the safety-first idea and putting up danger signs and other safeguards against accidents when ways are provided for men to get their liquor, and as a result, a considerable portion of the workmen enter the mines in the morning with their faculties dulled and their senses blinded to danger?

THE BOOTLEGGING EVIL

I have heard it argued that it is better to allow a saloon in the town for the reason that the whisky sold by saloons is purer than that sold by bootleggers. Again, it is claimed that whisky is a good medicine, and no doubt it is; but where one is cured by its use, how many there are who are killed owing to their own indulgence or that of others. I have known men to claim sickness in order to get the whisky they wanted to drink. In the discussion of the "Liquor Question in Mining," a short time since, I was much pleased with the letter of George N. Lantz, Vol. 7, p. 731, every word of which I can indorse. This was followed, on the same page, by another letter signed "A Mine Foreman," in which attention was drawn to the important fact that the license of the sale of liquor by the Federal Government in any of the states encourages the practice of bootlegging, in direct opposition to state and county laws that prohibit the sale of liquor within their boundaries. It would seem that this is an unfair dealing on the part of the Federal Government and that the Federal license should be limited to states and counties having no prohibition laws.

THE SALOON AND THE MINER

The claim is frequently made, as in the article entitled "Prohibition from a Miner's Viewpoint," by an Ohio superintendent, July 17, p. 80, that "we have no right to deprive these [foreign] miners of their enjoyment in liquor drinking or their poor man's club—the saloon—unless we can give them in return something besides work that will take the place of these evils." While believing this to be true, I would ask, Should we keep up a practice, for the sake of the foreigner, that is sending hundreds of American miners to their graves? I would ask the advocates of saloons in mining towns if they would be willing to allow themselves to be lowered 200 or 300 ft. into a mine knowing that a drunken hand holds the throttle. There is but one answer to that question.

Again, why should we join in or permit a practice that not only renders the miner more subject to accident by blunting his sensibilities, but may even incapacitate members of the first-aid team and cause them to blunder at a critical moment? All will agree that it is dangerous to enter a mine, much less to work therein, except with every faculty alert and under control.

Attention has been drawn to the need of providing other diversions when removing the saloon—things that will take the place of the saloon for men who frequent those places. I will not attempt to say what kind of diversions will prove most successful. Much good has been done along this line by many coal companies and by the Y. M. C. A. extension work. I do not believe that either of these, however, has been as successful as the work deserves. The efforts of the company are almost invariably regarded by the miners as being prompted by a selfish desire to increase their own gains. Too often the miner considers that all mine officials, from the president to the assistant foreman, think of nothing but what has a dollar mark before it and involves a 99-per cent profit. This is a great mistake.

TWO INTERESTING INCIDENTS

I recall working for a superintendent who was thought to be one of the hardest-hearted men in the county. On one occasion a driver was caught between a car and the rib and severely injured. A little later the mine foreman and his assistants were summoned to the superintendent's office, where a conference was held to ascertain who was responsible for the accident. It was shown that the mine foreman had directed one of his assistants to widen this place, but he had neglected to do the work. The expected upbraiding of the assistant for this neglect did not come; but, instead, the superintendent said, "Boys, I want you to do two things in your daily rounds of the mine—first, keep away from strong drink and, second, give the miners all the protection that can possibly be provided, for I would rather see the tipple burn down than know that I was the cause of crippling a man or injuring his health." That little incident convinced me that mine officials have hearts like other men and that this hard-hearted superintendent fully realized the importance of his men keeping away from liquor.

I recall another instance where whisky was the cause of more trouble than all the liquor in the state was worth: The drivers in a certain mine decided they would not water their mules and brought up the matter at their union meeting. While the question was being discussed and the leaders were trying to get the matter settled, a big drunken bully came in and took part in the discussion. He told the men that they were weak-minded and afraid to strike, and after cussing the superintendent, stated that he would whip the first man who went down the next day. As a result a local strike was voted by the men, who were much surprised the next morning to see this bully enter the mine in his working clothes and equipped for work. On being threatened, later, he stated he did not know anything he had done at the meeting the night before; he did not remember going to the meeting, he was so drunk. I cite this incident to show the danger of strong drink in a mining community.

Injured by Accident When Drunk

In connection with this subject I want to ask, If a man is known to have been under the influence of liquor when he was killed or injured, would the company that employed him be responsible for the accident? I knew of a case of this kind that was thrown out of court by the judge, who refused to proceed when it was known that the injured man was under the influence of liquor at the time of the accident. Although a surprise to some, the action of the judge would seem to be fully warranted, as the injured man was in no condition for work at the time when the accident occurred.

I have always favored prohibition, especially in mining towns. The acts of a single drunken miner may not only cost him his own life, but may produce untold suffering and anguish for a large number of his fellow workers and those dependent on them. I believe, however, that our efforts are not exerted in the right direction. Instead of trying to stop the sale of liquor, we should endeavor to prevent its manufacture. I hope to live to see the day when this will be done.

By J. T. Beard

The Coal Age Pocket Book

DENOMINATE NUMBERS

A **denominate number** is one expressed in units of a certain kind; as, for example, 5 days, 8 men, etc.

A **compound denominate number** is one expressed in two or more units; as 3 hr. 20 min., 8-ton mi., 4-acre-ft., etc. The terms ft. per sec., mi. per hr., rev. per min., etc., are all compound units.

An **abstract number** is any number not expressed in units of a kind; as 3, 5, 8, etc.

Kinds of Units—The principal kinds of units may be classed as follows:

1. Units of **weight;** as tons, pounds, ounces, grains, etc.
2. Units of **length** or distance; as miles, feet, inches, etc.
3. Units of **volume;** as cubic yards, cubic feet, etc.
4. Units of **capacity;** as gallons, quarts, pints, etc.
5. Units of **surface** or area; as square miles, square feet, etc.
6. Units of **time;** as years, months, days, hours, etc.
7. Units of **circular measure;** as degrees, minutes, etc.
8. Units of **currency;** as dollars, dimes, cents, etc.

WEIGHTS AND MEASURES

Systems in Use—There are two systems of weights and measures in general use, known as the "English, United States, or British," and the "French or metric" systems.

The **basis of comparison** of the English and French systems is expressed by the following established values:

Weight—The pound (7,000 grs.) is the same in the United States and Great Britain. The pound avoirdupois is equal to 453.5924277 grams in the French system.

Length—(United States) The length of the meter, by act of Congress, is 39.37 in. (Great Britain) The length of the meter, by act of Parliament, is 39.37079 in.

The slight difference in the length of the meter, as established by law in the United States and in Great Britain, makes the English inch and yard proportionally shorter than the same units in the United States.

Capacity—The gallon and liter are the accepted units of comparison in the English and French systems, respectively. The United States or "Winchester gallon," however, is quite different from the "Imperial gallon" of Great Britain, which was made the volume of 10 lb. of distilled water, at maximum density (4 deg. C.), weighed with brass weights in air at 62 deg. F., barometer 30 in.

Since 1 cu.in. pure water, under the same conditions, weighs 252.458 grs. and 1 lb. = 7,000 grs., the volume of the imperial gallon of Great Britain is

$$\frac{10 \times 700}{252.458} = 277.274 \text{ cu.in.}$$

The volume of the Winchester gallon of the United States is 231 cu.in. The French liter is the volume of 1 kg. of distilled water, at 4 deg. C., weighed in a vacuum, or 1000 c.c., which gives

Winchester gallon (United States), 231 cu.in. = 3.78543 liters.
Imperial gallon (Great Britain), 277.274 cu.in. = 4.54346 liters.

The Coal Age Pocket Book

UNITED STATES AND BRITISH SYSTEM

Following are the more useful of the tables of weights and measures in the English system:

AVOIRDUPOIS WEIGHT

		Equivalents	
16 drams	= 1 ounce	437.5	grains
16 ounces	= 1 pound	7,000	grains
28 pounds	= 1 quarter	448	ounces
4 quarters	= 1 hundredweight	112	pounds
20 hundredweight	= 1 long ton	2,240	pounds
Or, 25 pounds	= 1 quarter	400	ounces
4 quarters	= 1 hundredweight	100	pounds
20 hundredweight	= 1 short ton	2,000	pounds

The short ton (2,000 lb.) is more generally used in the United States.

TROY WEIGHT

24 grains	= 1 pennyweight		
20 pennyweights	= 1 ounce	480	grains
12 ounces	= 1 pound	5,760	grains

APOTHECARIES WEIGHT

20 grains	= 1 scruple		
3 scruples	= 1 dram	60	grains
8 drams	= 1 ounce	480	grains
12 ounces	= 1 pound	5,760	grains

The grain (Troy) is the same as the grain (apothecaries) and is the basis of comparison of these and avoirdupois weights. Thus,

1 lb. avoirdupois = 7,000/5,760 = 1.21528 lb. troy.
1 lb. troy = 5,760/7,000 = 0.822857 lb. avoirdupois.
1 oz. avoirdupois = 437.5/480 = 0.911458 oz. troy.
1 oz. troy = 480/437.5 = 1.097143 oz. avoirdupois.

LONG MEASURE

12 inches	= 1 foot		
3 feet	= 1 yard	36	inches
5½ yards	= 1 rod, perch, or pole	16½	feet
40 rods	= 1 furlong	660	feet
8 furlongs	= 1 mile	5,280	feet
3 miles	= 1 league		

The old surveyor's chain of 100 links (1 link = 7.92 in.) was 66 ft. long, making 80 chains = 1 mi. Chains now in common use are 50,100 and 300 ft. long, made up of 1-ft. links.

A fathom is 6 ft. or 2 yd., used in estimating depth.

SQUARE MEASURE

144 square inches	= 1 square foot
9 square feet	= 1 square yard
30¼ square yards	= 1 square rod
40 square rods	= 1 rood
4 roods	= 1 acre
640 acres	= 1 square mile

An acre contains 43,560 sq.ft. and measures 208.7 ft. on each side; $\sqrt{43,560} = 208.7$ ft.

Inquiries of General Interest

Handling Cars on Pitches

We are working a low seam of coal where the pitch is too great to allow the cars to be handled by hand and the seam is too low to permit mules to enter the rooms without brushing the roof over the road, which would entail too great an expense. The pitch of the seam is not sufficiently great to make the coal slide even when sheet iron is used in the chutes.

I have been informed that this seam can be worked most economically by employing a double-track gravity system in the rooms. As I am not familiar with this system of mining, will you kindly explain the method in detail? I will say that we are working under a fairly good roof, which will permit the use of the double track in the rooms if such a system is practicable. I would much appreciate, also, hearing from others who have had experience in working coal with such a system.

MINE SUPERINTENDENT.

——, Wash.

Before answering this interesting question, which we hope will lead to much practical discussion, it will be well to state the average grade limits for the different methods or systems of handling cars in rooms. The limit of grade on which cars can be handled economically and with safety is considerably modified by both the condition of the track and the rolling stock. Where the bottom is a soft fireclay, the track in the rooms often becomes very slippery. Again, where wood instead of iron rails are used in the rooms, the cars can be handled on a steeper pitch.

Following are the different systems in use for handling cars in the rooms, together with their average grade limits:

Cars handled by hand	Level— 6°
Cars lowered and hoisted by windlass	5°—10°
Self-acting incline	5°—15°
Gravity plane with barney	10°—30°
Buggy system in thick seams	10°—18°
Chutes lined with sheet iron (anthracite)	15°—30°
Chutes in natural formation (anthracite)	30°—up

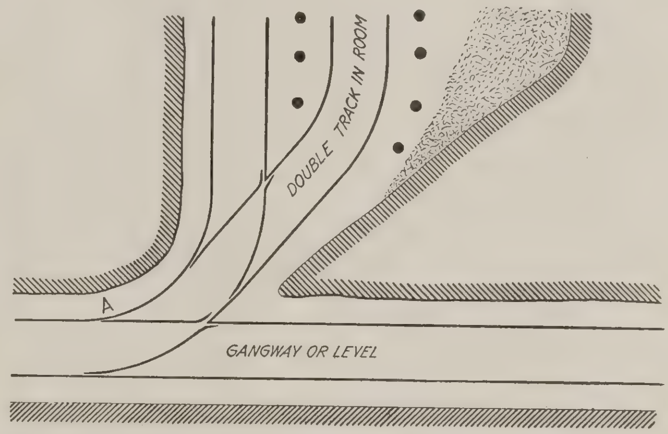
By adopting the alternative of driving the rooms at an angle with the gangway or level, it is possible to reduce the percentage of grade so that the grade limits mentioned above will apply to seams of steeper inclination. In this case, calling the angle of inclination of the seam the "dip angle" and the percentage of grade of the track the "grade angle," the ratio of the tangent of the grade angle to the tangent of the dip angle is equal to the sine of the angle the road makes with the gangway, measured in a horizontal plane. Calling the angle between the rooms and the gangway A, this relation is expressed by the formula

$$\sin A = \frac{\tan \text{grade angle}}{\tan \text{dip angle}}$$

For practical reasons, the angle between the rooms and the gangway is seldom less than 45 deg. For this angle (45 deg.) the tangent of the grade angle, or the percentage of grade, is seven-tenths of the tangent of the dip angle.

The system referred to by correspondent is illustrated in the accompanying figure, which shows the switch on the gangway as having fixed points, while that at the mouth of the room, for the double track, has movable points that are operated by the loaded car as it passes down to the gangway, leaving the switch set for the return of the ascending empty car on the same track.

In this system both the empty and the loaded cars are attached to a steel ¼- or ½-in. cable. One end of this cable is made fast by a clevis and pin to the loaded car. The cable passes over a 12- or 14-in. sheave or grooved wheel at the head of the incline and then down the other track, where it is made fast to the empty car standing on the gangway. In order to avoid the frequent splicing of the cable as the face of the room is advanced and a greater length of cable is required, the latter is made longer and the surplus length bound in a coil, which is laid on top of the car.



PLAN SHOWING ARRANGEMENT OF SWITCHES FOR DOUBLE-TRACK INCLINE IN ROOM

The system is a gravity system, or a self-acting incline, in which the descending loaded car draws up the ascending empty. The movement of the cars is controlled by a heavy brake stick, which is inserted between the groove of the sheave at the head of the incline and the clevis by which this sheave is made fast to the post, the clevis acting as a fulcrum for this improvised brake.

The post to which the head-sheave is attached, by means of a short length of chain or cable and a suitable clevis, is set in hitches cut in the roof and floor of the seam. As the face of the room is advanced, this post is moved up the pitch, and the cable supporting the cars is then lengthened by unwinding the coil previously mentioned. The pull of the cable on the empty car as it starts off the gangway is sufficient to cause this car to take the switch. The follower rail of the main track, marked A in the figure, is made slightly higher than the other rail of this track so that cars on the main line will not take the switch.

Examination Questions

Recent Iowa Examinations for Hoisting Engineers

(Selected Questions)

Ques.—(*a*) What is steam and how is it produced? (*b*) What is meant by high-pressure and what is low-pressure steam?

Ans.—(*a*) Steam is water vapor produced by evaporation of the water. Evaporation takes place at all temperatures, but is facilitated by the application of heat, causing an increase of temperature; also by a decrease of pressure. Under normal atmospheric pressure at sea level (14.7 lb. per sq.in.), pure water boils and steam is formed at a temperature of 212 deg. F. In the production of steam in a boiler, for power purposes, the temperature at which vaporization takes place increases with the pressure.

(*b*) There is no point of the gage that marks the distinction between low-pressure and high-pressure steam. For heating purposes, low-pressure steam is used, the pressure not exceeding 10 lb. per sq.in. For power purposes, perhaps the best answer that can be given to this question is to say that low-pressure steam is steam that has undergone one or more expansions, as in the case of the steam entering the low-pressure cylinder of a compound engine. On the other hand, high-pressure steam may be understood as referring to steam that enters the cylinder of the engine at or near boiler pressure.

Ques.—(*a*) In what respect is a flue boiler different from a tubular boiler? (*b*) Which is the more economical, and why?

Ans.—(*a*) The difference between these two types of boilers consists chiefly in the size and number of the flues or tubes. All tubes through which the flame and gases of the furnace pass on their way to the stack are properly flues, but the term "tube" is generally applied to drawn or lap-welded tubes, while the term "flue" is used in respect to a built-up flue.

(*b*) The tubular type of boiler is the more economical, because it presents a larger heating surface for the same grate area and gives a greater evaporation of steam per pound of fuel burned.

Ques.—What is the horsepower of a horizontal tubular boiler 5 ft. in diameter, 18 ft. long, containing seventy 3-in. tubes?

Ans.—The horsepower of this type of boiler is commonly estimated as varying from $^1/_{18}$ to $^1/_{14}$ of its heating surface. Assuming that three-fifths of the shell and ends of the boiler is exposed to the flame and hot gases of the furnace, the total heating surface of the two boiler heads, less the area that must be deducted for the seventy 3-in. tubes, is

$$2 \times 0.7854\,(3/5 \times 60^2 - 70 \times 3^2) \div 144 = 16.7 \textit{ sq.ft.}$$

The combined area of three-fifths of the shell, which is 60 in. in diameter, and the cylindrical surface of the seventy 3-in. tubes is

$$3.1416\,(3/5 \times 60 + 70 \times 3)\,18 \div 12 = 1159.3 \textit{ sq.ft.}$$

The total heating surface is therefore 1,176 sq.ft. Then, assuming the average ratio of heating surface to horsepower as 16, the horsepower of this boiler is 1,176 ÷ 16 = 73.5, say, 75 hp.

Ques.—An engine cylinder is 12 in. in diameter and 18 in. long. Find the sectional area and the cubic contents of this cylinder.

Ans.—The sectional area is $0.7854 \times 12^2 = 113.1$ sq.in. The cubic contents of the cylinder is therefore $113.1 \times 18 = 2{,}035.8$ cu.in.

Ques.—In case of imminent danger, supposing the water had fallen below the water gage or the pressure had become dangerously high in a boiler of which you had charge, what would you do?

Ans.—In case the water has fallen below the gage or glass and does not appear in the lowest trycock, open the furnace door and dampen the fire with a few shovelfuls of green coal or ashes. Do not disturb the fire, as this would only increase the heat of the furnace and make the danger the greater.

A dangerously high pressure could only result by the sticking of the safety valve. It is not generally considered well, in that case, to force the safety valve open suddenly. Every effort should be made to reduce the pressure by starting the engine or allowing the escape of steam by any means available. As easily as possible, the safety valve should be released.

Ques.—A boiler is to be run under a pressure of 100 lb. per sq.in.; to what hydrostatic pressure ought this to be tested for safety?

Ans.—The rules of different underwriters vary in regard to the hydrostatic test of boilers. The pressure to which the boiler should be subjected in this test will depend to some extent on the factor of safety used in its manufacture as well as the service for which it is designed. The hydrostatic pressure is sometimes made twice the working pressure of the boiler. At other times a hydrostatic pressure half again as great as the working pressure is employed, and again the hydrostatic pressure when testing a boiler is increased from 80 to 100 lb. above the working pressure.

Ques.—What is piston displacement, and how is it measured?

Ans.—Piston displacement, in engine practice, is the volume of the space passed through by the piston when making a single stroke. It is measured by the product of the sectional area of the cylinder and the length of the stroke.

Ques.—Name and define four important events in the distribution of steam which occur in every revolution of an engine.

Ans.—The four important points in the cycle of a steam engine are the point of admission when the steam port begins to open; the point of cutoff when the steam port is closed to the admission of steam; the point of release determined by the opening of the exhaust port; and the point of compression, which begins with the closing of the exhaust port.

Coal and Coke News

Harrisburg, Penn.

Millions of dollars are at stake in an equity suit now before Judge C. N. Brum at Pottsville.

It is a suit to prevent the board of city trusts of Philadelphia, which has leased the Girard estate coal lands under the city of Shenandoah to the Thomas Colliery Co., from removing the pillars which now hold up considerable of the real estate of Shenandoah.

Half a million tons of coal are in the pillars, the market value being considerable more than $1,000,000. But the safety of several millions of dollars in real estate also hinges on the case. The Home Brewing Co., is the complainant in the case and Archbishop Predergast has also secured leave to intervene, because St. Casimer's Catholic Church valued at $80,000 is in the danger zone and may be affected if the pillars are removed.

The court is called upon to decide whether the mining company shall be made to suffer by reason of prohibition against the removal of the remaining pillars of coal, or whether the surface property owners shall be compelled to run the risk of great damage.

The action is similar to those taken in Scranton and Wilkes-Barre, differing only in detail. The leading question is whether reservation to a mining company which has bought or leased coal and has obligated itself to pay for it, are in the nature of an inviolable contract when mining is conducted in such a way as to imperil life and also vast property interest. The Supreme Court has already decided that where stipulations in a deed are clear, surface property owners have no redress, and that even risk of life cannot be taken into account in a suit to annul a company's right to take out as much coal as it pleases.

In this connection the Supreme Court has said that "Where one person owns the surface and another person owns the coal or materials lying underneath, the under mineral estates owes a servitude of sufficient support to the upper or superincumbent estate. This principle has no application where the same person is the owner of both estates, nor does it apply where by contract between the parties they have covenanted for a different rule. Like any other right, the owner of the surface may part with the right to support, by his deed or covenant.

"Where a conveyance of surface reserves to the grantor the right 'to mine and take away the coal without making any compensation to the grantee, his heirs or assigns, for any effect upon, or injury to the said lot or piece of ground, or the surface thereof, or to the buildings erected thereon in consequence of mining,' the grantee has no right to surface support, and cannot recover for failure to support, even if that has been caused by negligent mining."

Owners and lessees of coal have been so well fortified by the above decision that they contend that the only safeguard is some arrangement with them by which owners of surface property will pay then for the coal that should be left standing. This was, in substance, the principal recommendation made by the Cave-in Commission appointed by Governor Tener several years ago.

It is evident that the only hope of surface owners is that by some extension of the police powers of the state, not yet tried out in litigation, relief may be afforded them, on the ground that no private contract should jeopardize life. There is some hope of securing relief through a municipality's control over public streets and buildings. Along these lines litigation has not yet been carried to the higher courts. The outcome of the suits at Pottsville will be awaited with the keenest interest by the entire anthracite region.

PENNSYLVANIA

Anthracite

Pottsville—The Supreme Court has decided that the office of Mine Inspector is a state position, and candidates must therefore be elected in the even numbered years and not the odd numbered. Accordingly the names of Archie B. Lamb, of Shenandoah, and P. J. Fenton, of Mahanoy City, have been stricken from the ballot. All nominations for this office are now valueless.

Pittston—Something of a novelty was introduced at a recent meeting of the Pittston Mining Institute, at which Mine Inspector Samuel J. Jennings gave an address on "The Practical and Economical Use of Timber at the Mine Face." Demonstrations were given by the use of a wagon-load of mine timber which had been placed on the stage of the meeting room.

Scranton—Three homes on Beech St. were badly damaged by a cave-in of the National mine of the Lackawanna Coal Co. recently. Two of the houses were not in use, the occupants having removed on warning from the company to do so. The other house was badly wrecked, while the two above mentioned were tilted entirely from their foundations.

Shenandoah—The collieries of this region, which have been on a three days a week schedule for several months, have now gone on full time. This is the first time the mines have worked full time since last December.

Hazleton—Of late it has been quite noticeable that the number of miners who desert the mines for the farm is on the increase. Especially is this true of the foreigners who come from agrarian districts in their native land. As soon as they can accumulate sufficient money in the mines to buy a small farm they lay down their tools. The Rush and Quakake valleys in this county are dotted with the farms of the former miners. These men accustomed in the home country, where land is scarce to till the soil up to the very doorstep, are making a success of what have been termed hereabouts worn-out farms.

McDonaldtown—Officials of the Brothers Valley Coal Co. were forced to close down part of their plant at this place on Oct. 14, because of a car famine. It was found impossible to get cars into McDonaldtown. All the available rolling stock had been filled the night before. The car famine comes at a bad time, as the Brothers Valley company has a number of orders which require immediate shipment.

Bituminous

Johnstown—Coal operators in this part of the bituminous field are not seeking war orders to any great extent, but say they have received numerous inquiries of late from Italy and Spain, as well as from South America. One of the chief objections to the foreign orders is said to be that buyers in both Europe and South America expect the shipper to pay the freight and insurance, while the American method has always been to charge the freight to the consignee. Foreign buyers also specify that the coal shall contain no sulphur, and shall be high in volatile matter, conditions which are said to be difficult to meet in this part of the bituminous field. There appears to be a general feeling among the coal men also, that any business gained now in foreign fields will be lost immediately on the conclusion of the war. Some foreign orders have been placed, but they are limited in quantity, and the fields which they affect are not large.

Uniontown—Without a car of holdover coke in the region and agents applying daily for contracts at present rates, coke producers of Fayette county are on the qui vive, anticipating one of the greatest demands for their fuel that has ever been known and at prices which will make up for some of the hard times since 1907. New plants are being fired and old plants, idle from 6 months to two years, are cleaned up and ready to start when the directors give the word. The Emery plant of the South Fayette Coke Co. is running full. Sometime within the next few days the Newcomer Coke Co., will begin operations at its new plant near McClure Station and both the Gilmore and Plumer coke companies are ready to operate at a few hours notice. The former has 102 and the latter 72 ovens available.

Announcement was recently made by the H. C. Frick Coke Co. that 500 additional ovens were fired recently at Bitner, which plant has been idle for more than a year; 200 to 300 ovens have been blown in; 750 additional ovens will be fired at 18 plants shortly, bringing the output of this company to a 90% capacity. The plants affected are Adelaide, Brinkerton, Buffinton, Calumet, Continental, Continental No. 2 Continental No. 3. Dorothy, Hecla, Kyle, Marguerite, Standard, United, York Run, Hostetter, Whitney, Leisenring No. 2, Le Monte and Bitner.

Connellsville—An increase of 20,000 tons per week recently brought the production of the Connellsville region to 418,000 tons. This is the greatest output since the first quarter of 1913.

According to reports the H. C. Frick Coke Co., is still continuing in its efforts to extract valuable products from the sulphurous water pumped from its many mines in western Pennsylvania. The latest attempt is at the Calumet plant near Mount Pleasant where the sulphur-laden water is pumped into a large tank where a churning process is constantly going on, and from whence it will pass through machinery designed to separate the byproducts from the water. These consist of iron oxide, sulphur and other minerals.

MARYLAND

Baltimore—It is stated that the Consolidation Coal Co., since Jan. 1, has mined and shipped coal at the rate of 1,000,000 tons per month. Since Aug. 1 the Consolidation Co. has exported hundreds of thousands of tons of fuel. There now exists a shortage of cars and men, the first being due largely to increased manufacture, while the second is the result of the European war.

VIRGINIA

Big Stone Gap—The coke plant of southwest Virginia are being put in shape for active operations, and it is believed that all of the ovens will be in blast by the first of the year. The most serious problem which the producers have to face is that of labor.

WEST VIRGINIA

Moundsville—As soon as the special receiver was appointed for the Mound City Coal Co., men were put to work cleaning up the mine ready to start operations. It is hoped that this mine will run steadily with a considerable number of men. The Dollar Saving and Trust Co. of Wheeling is the special receiver.

Within the next few days work will be started to increase the capacity of the railroad switch at the Rail and River coal mine No. 3 at Big Run, near this city. The present switch has a capacity of about 22 gondolas, the additions will give a capacity of about 50 cars, so that the mine can be worked full time whenever orders for the entire output can be secured.

Charleston—It is reported by the Department of Mines that 13 out of the 32 fatalities due to accidents occurring in in the mines of West Virginia during September took place in McDowell County. Of the remaining 19 fatalities four occurred in Fayette County, five in Raleigh, two each in Harrison and Logan counties, and one each in Brooke, Marion, Mercer, Mingo, Ohio and Tucker counties. Ninteen deaths were due to falls of slate and coal. Mine cars killed six men, locomotive, two, electricity, three, and monitors, one.

Pocahontas—It is estimated that the Pocahontas field has been affected less through foreigners answering the call to arms in Europe than any other coal field of the state. It is said that throughout the Pocahontas field virtually no shortage of labor exists, while this has become a serious problem in some of the other coal fields.

OHIO

Bellaire—The Lansing mine of the Lorain Coal and Dock Co. started work recently after being idle for 19 months. When working full this mine employed 400 men, about half that number being now at work.

Cincinnati—Members of the Ohio Coal Operators' Association have been informed of the decision of four railroads handling coal shipments from south of the Ohio river to increase the differential in favor of Ohio, in order to meet the objection of the Ohio men that they could not compete with West Virginia and Kentucky coal in the markets of the West and Northwest. The railroads affected include the Chesapeake & Ohio, the Louisville & Nashville, the Baltimore & Ohio and the Queen & Crescent.

INDIANA

Linton—Operations have been resumed at the Little Giant mine after several weeks' idleness. Three hundred men are employed.

Columbus—The Columbus Chamber of Commerce has filed a petition with the public service commission at Indianapolis against railroads connecting the Columbus territory with the coal fields of Indiana in which it is declared that discriminatory rates on coal to Columbus manufacturers has kept many of them from making needed extensions to their factory properties, even though the stimulus of the European war has been felt in many industries there. The commission is asked to make an order reducing and equalizing rates on coal for manufacturing purposes. The Central Indiana Ry. Co., Chicago, Terre Haute & Southeastern R.R., Cleveland, Cincinnati, Chicago & St. Louis, the Illinois Central, Lake Erie & Western, Pittsburg, Cincinnati, Chicago & St. Lous and the Vandalia railroads are complained of in the petition.

Sullivan—Joseph Weatherly, fire boss at the Peerless mine, has invented a roof support for entries and air courses. By his plan, coal is overcut by an adaptation of the topcutting mining machine, arranged to form a curved kerf at the elevation of the roof. When the coal below the kerf is removed, that above it forms a roof-supporting arch of sufficient depth at the ribs to hold the overlying stratum and with enough thickness at the middle to protect the slate from air slacking.

ILLINOIS

Witt—The three large coal mines at this place were closed Oct. 13 for an indefinite period, throwing 600 men out of work. Many of the miners are preparing to leave here and seek homes and work elsewhere.

Springfield—Every 320,000 tons of coal mined in Illinois for the year ending June 30, 1915, cost one life, according to the report of the Illinois Mining Board. One hundred and eighty men were killed while employed about the mines. Of these 176 met death underground. Serious injuries totaled 1013. A total of 75,607 men were employed in the 779 coal mines of the state. These mines produced 57,601,694 tons, of which 56,173,176 tons came from 281 shipping or commercial mines. The number of mines in operation was 16 less than the previous year. One hundred and twenty-three new mines were opened during the year and 139 were closed or abandoned. Of the output 11,100,890 tons was delivered to locomotives at the mines, 41,461,218 tons was shipped and 2,000,000 tons was used or wasted at the mines. Five hundred and eighty-two motors and 1,708 machines were in operation and the machine-cut coal totaled 34,037,426 tons against 23,564,268 tons mined by hand. The average price paid per gross ton for hand mining was $0.52. To blast this coal 1,106,786 kegs of powder were used.

Mt. Olive—Operators of the standard field in Illinois are no longer required to shut down on "Virden day" or pay a fine. Annual memorial services for the four men killed in a strike riot at Virden 15 years ago this month are still held by the miners, but the prohibition against work on that day in the inner group of mines has been lifted.

IOWA

Des Moines—With the advent of frosty weather the coal mines in and about Des Moines are putting on larger forces of men and within another 4 to 6 weeks, will be running full capacity. According to reports coming in to the state mine inspector's office, all of the mines in the state are taking on more men.

Notwithstanding the fact that its mines are being worked out and the consumption of coal is increasing, Iowa has enough coal to last 2,500 years, according to geology experts. Mr. Campbell of the Geological Survey has estimated that the original coal supply of Iowa was 29,160,000,000 tons. From 1840 to June 30, 1914, the amount of coal mined in the state, according to the records of the state mine inspector's office, was 182,612,952 tons.

COLORADO

Denver—Owing to the fact that there promises to be a steady growth in the buying of soft coal for export, soft coal conditions in Colorado have already reached a point 100 per cent. above normal. Colorado coal will probably not be exported to any extent, but domestic markets which may be reached from this point will be fed from Colorado.

WYOMING

Kemmerer—It is stated that the Cumberland Mines now have an output of about 2,000 tons per day with 400 men on the payroll. Prospecting has been carried on for some time past on the west crop of the Cumberland seam, some distance from the present mine. It is understood that the prospects in Uinta County are sufficient to warrant the company in opening a new mine, and a force of men will shortly be put to work driving a slope. This will be on an 8-ft. bed of the same coal as is now being worked.

FOREIGN NEWS

Toronto, Ont.—A receiver and manager of the Inverness Ry. and Coal Co., of Nova Scotia, has been appointed by the court on the application of the National Trust Co., Ltd., trustees for the bondholders. This action was recently decided upon at a meeting of the bondholders at which 50% of the outstanding bonds were represented. A bondholder's committee was appointed to advise the trustees respecting any matters which may arise in connection with the receivership. It is expected that the operations of the company will meet working expenses during the continuance of the receivership.

PERSONALS

Lyell Buttermore, payroll clerk at the Coldbrook plant of the H. C. Frick Coke Co., has been transferred to a similar position at Bitner.

B. C. Price, of Kingston, Penn., for 26 years an employee of the Lehigh Valley Coal Co., has resigned his position as chief clerk of the Wyoming division, to accept a position with the Hudson Coal Co. as chief accountant for the Wilkes-Barre division.

P. J. Rogers, president of the Alabama state convict board is visiting the coal producing counties of the state to familiarize himself with coal mining, as he is planning to work state convicts in the development of coal lands owned by the University of Alabama at Tuscaloosa.

Earle A. Henry, chief of the West Virginia Department of Mines, recently conducted examinations at Mt. Hope, where 76 men were examined for the positions of mine foremen and firebosses. Fifty-two of this number were given practical gas tests in a mine as part of their examination work.

James Cole Roberts, mining engineer in charge of the United States Bureau of Mines at Denver, Colo., has resigned that position to accept the professorship of the newly created chair of Safety and Efficiency Engineering at the University of Colorado, at Golden, Colo. He will assume the duties of his new position about Nov. 15. His successor with the Bureau has not been named.

Thomas E. Ashman, veteran coal miner of Des Moines, Ia., has just inherited $80,000 from a distant relative, of whose existence he was never aware, but is still working in the mines. Ashman received the good news calmly. He has a wife and one daughter and is paying for a home in monthly installments. He is one of three heirs to the estate of a Mr. Belinsky, Russian banker, who died recently in England leaving a fortune of £48,000.

Henry T. Bardeleben, president of the W. G. Coyle Coal Co., of New Orleans, has signed an order giving 15 days' extra pay to every employee of the company. The bonus is for the splendid services performed by the employees during the hurricane that struck the port Sept. 29. The company's loss in the storm was virtually $30,000; but would have been much more had it not been for the courage and coolheadedness of a number of the company's employees.

OBITUARY

Charles Klepser, a mining engineer 25 years of age, was killed on Oct. 15 by a fall of coal in a mine at Portage, Cambria County, Penn.

Harry W. Errett, 46 years of age, secretary and treasurer of the Troll Coal Co., of St. Clairsville, Ohio, died recently at his home in that city.

Joshua William Alder, well known in the coal trade of the country and for years engaged in the publication of maps and compilation of statistics relating to the coal industry, died recently in Muncy, Penn. at the age of 84 years.

Enoch Garver, aged 60, a mine inspector, died Oct. 18, in a hospital in Charleston, W. Va., as a result of injuries received in the Sunday Creek Coal Co.'s mine at Longacre some time before when a coal car jumped the track crushing him against the rib.

James Kennedy, a member of the Miners' Certificate Examining Board died in Pottsville, Penn., recently after a lingering illness. He was formerly a fire boss at the Blackwood colliery and was prominent in mining circles throughout the region. He was 48 years of age.

W. H. Motter, of Denver, Colo., a man who is well known as a successful inventor of mining machinery died recently at the home of his daughter Mrs. T. P. McAndries after a short illness. He was a veteran of the civil war and a member of the Grand Army of the Republic. He leaves a large circle of friends.

John J. Doherty, a well-known mine foreman, died at his home recently at Latrobe, Penn. For three years Mr. Doherty has suffered from cancer, but prior to his retirement from active life he was connected with a number of coal mines in that section. Mr. Doherty was 51 years of age, and is survived by four children.

INDUSTRIAL NEWS

Des Moines, Iowa—The Maple Block Co. is opening a new field on the Addison Parker farm, north of Des Moines.

Pittsburgh, Penn.—The Consolidated Coke Co. of Uniontown has absorbed the Pickands-Magee Co. of Pittsburgh.

Gadsden, Ala—It is reported that the Gulf States Steel Co. will spend in the near future approximately one million dollars in improvements and additions to its plant.

Boswell, Penn.—One of the most valuable coal tracts in Somerset County known as the George Reiman tract located in Jenner Township has been sold to the United Coal Co. This tract contains 128 acres of coal.

Whitesburg, Ky.—It is announced that the Mineral Development Co., of Philadelphia, will make two coal developments along Colly Creek a few miles above this city, the initial work to start within the next 60 days.

Charleston, W. Va.—A deed was recently recorded showing the transfer of somewhat over 1,000 acres of coal land on Cabin Creek in Kanawha County, from the Williams Coal Co. and the Cabin Creek Kanawha Coal Co. to the Shonk Land Co.

Cresson, Penn.—It is stated that due to the general increase in business, a number of mines in this section which have been idle for more than a year are now being put into condition to be operated to full capacity. Other mines now operated will be speeded up to fill orders now coming in.

Cincinnati, Ohio—The United States Circuit Court of Appeals has decided against the Marmet Coal Co. in its appeal against a judgment in favor of the People's Coal Co., of Pittsburg, for $12,000 as balance of the purchase price due on 55 coal barges purchased by the Marmet company in May, 1911.

Washington, D. C.—Tariffs of the Central R.R. Co. of New Jersey, proposing payment of allowances to the Lehigh Coal and Navigation Co. out of its freight rates on anthracite coal from Hauto and Nesquehoning, were recently ordered canceled by the Interstate Commerce Commission. Such allowances were held to be unlawful by that body.

Pittsburgh, Penn.—It has been reported that a resurvey of the property of the Pittsburgh Coal Co. has been made and that most of the stock recently bought has gone into the hands of affiliations of the Midvale Steel Co. It is said that the Pittsburgh Coal Co. will henceforth be closely connected with the Midvale Steel Corporation even though it is not actually absorbed thereby.

St. Louis, Mo.—The meeting of the St. Louis Coal Club which was to have been held Oct. 18 has been postponed to Oct. 25. The principal speaker of the evening will be C. N. Talbert, director of streets and sewers. He will tell the coal men what his department has to contend with on account of overloaded coal wagons, etc.

Chester, Miss.—It is said that in the vicinity of Reform some 12 miles north of this place, a coal measure has been found, and it is believed that mining upon a more or less extensive scale will be attempted before the end of the present year. A coal company has been formed, and various purchases and leases made.

Clearfield, Penn.—H. P. Dowler has purchased the Fayette Coal Co.'s mining plant and property at Dola, W. Va. This property consists of approximately 1,250,000 tons of coal in the seam and a well equipped mining plant. It is the intention of the purchaser to improve the property and operate with an output of 1,000 tons per day.

Springfield, Ill.—The Public Utilities Commission of Illinois took up recently the complaint of the Southern Coal, Coke & Mining Co. against the Vandalia and Southern railways companies. The complaint is based on the refusal of the Vandalia to establish through routes and joint rates on coal from the mines on the Southern Railway to points on the Vandalia line.

Waynesburg, Penn.—Large payments on Green County coal acreage were recently made in Waynesburg by the Cleveland Cliffs Iron Co., of Cleveland, Ohio. Three mortgages for $90,000, $12,000 and $235,000 were satisfied. These were respectively to Mrs. Mary Hawkins, Sarah McClenathan, and

Rex Moredock, of Jefferson, and to J. V. Thompson and associates of Uniontown.

Belaire, Ohio—It is stated that the George M. Jones Coal Co. will probably construct a new tipple for its pultney mine unless plans can be devised to equip the old one with proper scales and machinery. While the new tipple is being erected, the miners employed at Pultney will be transferred to the Webb mine which in the meantime will be placed in shape to resume operation.

Youngstown, Ohio—The American Tar Products Co., which operates a plant at Crab Creek, Ohio, has completed negotiations with the Republic Iron and Steel Co. for the tar products from the new by-product ovens of the latter company, 75 in number, which will be completed in a few days. The tar products company may have to extend its plant in order to take care of the new material.

Birmingham, Ala.—Owing to the improved pig-iron market, several of the largest iron producers of the district are repairing and will soon put into blast additional furnaces. The present price is the best obtained for several years, and the make for September was the largest in the same length of time. Stocks on hand are being rapidly reduced and it will be necessary to put additional furnaces into blast to take care of orders.

Cincinnati, Ohio—The Ulland Coal Co. has filed a complaint with the Interstate Commerce Commission claiming reparation from the Louisville and Nashville R.R. Co. on numerous coal shipments from Kentucky and Tennessee mines to the company's Hunt St. station in Cincinnati. It is claimed that the revision of Apr. 15 advanced the rate to an unreasonable extent as compared with other points in the Cincinnati district.

Philadelphia, Penn.—This port continues to show a big increase in coal shipments over the piers. For the period of nine months ending Sept. 30 there were 792,600 tons of bituminous coal loaded as compared with 480,336 for the same period last year. The anthracite tonnage also showed a good increase with 51,583 tons as against 41,861 tons. The total value of all shipments is placed at $2,705,115, compared with $1,571,293 last year.

Birmingham, Ala.—C. H. Nesbitt, state mine inspector, asserts that the coal production in the state during the present year may be 16,000,000 tons, and may even go higher. The output from the larger mines to supply the metal industries has brought the figures up to this satisfactory output. There is agood demand for coke, and the starting of a number of beehive coke ovens shortly will mean a further need for coal before the end of the year.

Philadelphia, Penn.—The Philadelphia and Reading Ry. coal barges "Tunnel Ridge" and "Coleraine," which foundered in a storm off Provincetown, Mass., recently have been stripped of their fittings and the hulls burned, so as to remove the possibility of their becoming a menace to navigation, as it was declared impossible to float them. The "Manheim," which went ashore at the same time, is in such a position that it is thought likely to float her.

Denver, Colo—It was rumored in Denver that the corporation of E. I. Du Pont de Nemours & Co., whose domicile is in Delaware, has obtained an option on the common stock of the Colorado Fuel and Iron Co. It was further said that the Pueblo plant of the Colorado Fuel and Iron Co. would be turned into an ammunition factory, in conjunction with the Midvale Steel Co., which the Du Ponts and W. E. Carey are said to have just acquired. The rumor has been denied.

Wheeling, W. Va.—Attachments for sums aggregating $49,233 and covering 11,450 acres of coal lands near here have been filed against J. V. Thompson, of Uniontown, Penn., whose affairs have been in litigation for nearly a year, following the closing of the First National Bank of Uniontown. The attachments were filed on behalf of William T. George, J. R. Barnes, Robert E. Umbel, John Brown and Samuel Woodward, all of whom allege that they hold notes against Thompson.

Belleville, Ill.—R. W. Ropiequet, attorney for the St. Louis Coal Traffic Bureau, has filed with the Public Utilities Commission of Illinois a petition for a rehearing in the Illinois coal rate case which was recently passed on by the commission. The railroads were permitted by the commission to put into effect a new coal rate into the East St. Louis market, increasing the rate from 32c. to 37½c. a ton. The rate had been suspended for several months while the operators and the City of Belleville tried to have the suspension made permanent.

Birmingham, Ala.—The first shipment of coal to be made by barges on the Warrior River by the De Bardeleben Coal Co. was recently loaded at Cardova. There are now three large companies using the Warrior for barging coal to Mobile and New Orleans. The Tennessee Coal, Iron and R.R. Co. is shipping 10,000 tons of coal per month to New Orleans. The Pratt Consolidated Coal Co. ships more than a thousand tons per week, and the De Bardeleben Co. has a contract to furnish the United Fruit Co. at Mobile with 40,000 tons of coal during the present fiscal year.

Clearfield, Penn.—The Pennsylvania Public Service Commission has issued an order dividing between interested railroads the revenues for hauling coke from the Gallitzin, Connellsville, Clearfield and other fields to the plants of the Lehigh Fire Brick Works, Bryden Horse Shoe Co. and the Crane Iron Works at Catasauqua. The case was heard last winter and attracted wide attention because of the questions involved. The new order decides that the Lehigh and New England R.R. shall receive 33c. out of the revenue on each ton of coke and the Pennsylvania and Lehigh Valley railroads will receive the balance.

Columbus, Ohio—The Chesapeake & Northern Ohio Ry. Co. has asked the Public Utilities Commission for authority to increase its capital stock from $50,000 to $3,450,000 and to issue $1,000,000, 5 per cent. 30-year gold bonds. Proceeds from the sale of the securities are to be used in taking up present floating indebtedness. The company reported that in building its new line from Portsmouth to Columbus it has already spent $1,354,000 and expects to spend $3,264,000 additional to complete the line. The Hocking Valley Ry. also applied to the Utilities Commission for permission to issue $4,000,000, 2-year 5-per cent. gold notes to refund an equal amount of 6-per cent. notes, due Nov. 1.

Denver, Colo.—A suit has been filed with the state public utility commission by the Grand Junction Mining and Fuel Co. and also by the Palisade Coal and Supply Co. to compel the Denver and Rio Grande R.R. to give better rates in Mesa County, Colorado, where the railroad carries coal from the Cameo mines. They also attempt to force the railroads to make a publication of tariffs for coal rates from Denver to Salida. The petitioners allege that the rates are unfair and unjust and that furthermore the rates charged from Bowie, Somerset and Crested Butte and from Thompson, Utah, are so heavy that it is impossible to compete for the business of Denver or other cities in eastern or central Colorado.

Cincinnati, Ohio—The annual meeting of the Kanawha Coal Operators' Association, of West Virginia, was held here on Oct. 15, one of the chief matters of business taken up being that of the proposed change in rates from West Virginia mining points to the West. The association determined to engage counsel to appear before the Interstate Commerce Commission on its behalf, together with counsel for other West Virginia operators. No action will be taken, however, until the proposed rates are filed to become effective. Col. E. O. Dana, of Cincinnati, was reëlected president of the association, T. J. Hatfield, of Covington, Ky., being elected vice-president. The executive committee consists of Frank O. Harris, chairman; Michael Gallagher, John H. Winder, S. B. Stewart, J. W. Dawson, G. H. Powell and Edw. Schonebaum.

Denver, Colo.—N. S. Walpole, owner of a quarter section of state land in Routt County has entered suit in the district court of Colorado to enjoin the state land board from granting to George Morrison a 5-yr. mineral lease upon his land with the right to mine for coal. The surface rights of the land are worth only $16,000, but since Walpole acquired the land a big vein of anthracite coal has been discovered estimated to be from 6 to 8 ft. thick. The state gets a royalty of 10c. on every ton of coal mined under the state laws and it is estimated that the school fund would receive about $550,000 if the clause which is included in every sale certificate that the state reserves all mineral rights is upheld in the courts. This is, of course, a test case. Last May an application was made by Morrison to the state board for mineral rights.

Benton, Ill.—A New York syndicate has employed several men to conclude the purchase of a large coal field in Southern Illinois. The deal will comprise from 300,000 to 400,000 acres of coal land in the counties of Saline, Hamilton, White, Gallatin and Franklin, and means an expenditure of $20,000,000 in those counties and probably the building of several railroads. The Louisville & Nashville R.R. Co. for the past few months has had engineers investigating the route for a railroad running from Evansville, Ind., by way of Ridgway and Equality, Ill., through Horseshoe Gap, tapping the coal and mineral belt of Hardin and Pope counties and connecting with the bridge that is now being constructed at Metropolis. The opening of this great field will necessitate the building of many other railroads to handle the large output which will be exported by a New York company.

Coal Trade Reviews

General Review

Anthracite trade even better than anticipated. Heavy movement of bituminous on contracts. Vessel shortage and improved local conditions cause slump in exports. Lake markets strong. Middle West unusually brisk.

Anthracite—Mine operations are now on a full time basis, and the market has stiffened up, probably even beyond expectations of the more conservative members of the trade. The car and labor supply are slowly becoming the controlling factors; shortage of special kinds of equipment, particularly for shipment to the West, is causing anxiety as regards the future. Concessions on the regular circulars are confined to unusual situations where it is necessary to move tonnage, and this in spite of the fact that there is a well defined effort noted in many directions to establish new high selling records. Unsold coal at tidewater is practically all cleaned up, and there is an excellent movement in the coastwise trade. Lake shipments are only fair.

Bituminous—A progressive improvement still characterizes the soft-coal trade, though the increased demand is confined essentially to extra requisitions on contracts. Forehanded consumers are now beginning to accumulate all the surpluses of the high-grade fuels they can carry, though prices generally have not responded to the improved tone, with a possible exception of a greater firmness. Manufacturing demand is steadily expanding, and even the more conservative members of the trade are notably optimistic. Car shortages are becoming more frequent, and this is causing much concern over the outlook for a month or two later; an encouraging aspect of the transportation problem is the effort being made to rush new equipment into service with the utmost dispatch.

Exports—Foreign shipments have fallen off at a pace equalled only by the recent spectacular increase. The accumulation at exporting piers is substantially above normal, and unless the balance of the month is characterized by an unexpected and notable increase, the October record will show up poor. The acute shortage in vessel tonnage is the principal cause of the decline, though the improvement in the local market and the exacting conditions defined by foreign buyers are also contributing factors. Vessel rates are not so high as last week but tonnage offering is eagerly mapped up to cover numerous orders.

Lake Markets—Demand from the steel industry, consumption in which has been up to the maximum capacity for the past several weeks, has taken another spurt due to stocking operations against possible future emergencies. It is a significant fact that the customary depression that characterizes the approaching close of Lake navigation, is entirely absent. The car shortage is steadily developing to greater proportions and is having a notable tendency to stiffen prices, conservative buyers coming into the market for surplus tonnages. Confiscation of coal by the Pennsylvania R.R. is also an important development of the week. Retailers stocks are only fair as a result of the light buying through the summer, and the cooler weather, with the consequent rush of orders from domestic consumers, has resulted in greater buying from the mines. The Southern market is substantially better than for some time, particularly as regards the movement on contract but there is still considerable room for improvement.

Middle West—The domestic trade is unusually brisk, steam business has improved, rush orders are more frequent, and there is evidence of the demand outstripping the production. Receipts at the upper lake docks are larger than last week, and shipments to interior points are substantially greater than during this time last year. Restrictions governing the use of coal cars are becoming more frequent. Railroads continue buying actively and production is at a relatively high level. Evidence of the better conditions prevailing is seen in the firmer attitude retailers are taking as regards credits. Some producers are already falling behind on contracts.

A Year Ago—Anthracite trade slowing up due to the warm weather, and concessions on the circular are freely offered. Further restrictions and cancellations are the features of bituminous. Practically no spot demand.

BUSINESS OPINIONS

Bradstreet—Trade expands at a speedier pace, and reports, especially from the eastern half of the country, are more satisfactory than for three years past. Activity in industries, many of which are sold far ahead, is accompanied by stiffer commodity prices, broader distribution by jobbers, good sales by retail dealers, enlarged road orders, increased railway traffic, improved commercial demand for money, plethoric supplies of funds, largely increased bank clearings, better collections and reports that many houses have increased their traveling forces. Stocks of staple wearing apparel at practically all points are light, the result of long-practiced conservative buying, and the uplift in trade seems to have developed a rush to cover requirements.

Dun—With cross currents diminishing in force, the tide of business is rising at an accelerated pace and an era of widespread activity is in prospect. Usually during a transition period gains are recorded slowly, but strictly mercantile conditions have passed the stage where progress is difficult of discernment, and of late industrial expansion has been phenomenally rapid. Reports from nearly all sections of the country tell of the unchecked growth of new enterprise, which, while manifest in varying degrees in different lines and localities, is everywhere stimulated by the exceptional strength of the fundamental situation. Assurance of agricultural success, together with almost unlimited financial resources, has given the commercial world the confidence essential to the development of national prosperity.

Marshall Field & Co.—Current wholesale distribution of dry goods shows considerable increase over the corresponding periods of the past two years. Buyers continue to come to market in much larger numbers. Collections are about normal. The cotton market is strong with continued advances and the trade in domestic cotton cloths is fairly active. The raw silk market has also shown considerable advance during the week anl still has a strong upward tendency. Finishers of cotton and silk goods have advanced their prices considerably the last few days.

Boston News Bureau—The general situation is assuming a more stable position. There is less sensational speculation and more legitimate operation. The credit departments of almost every bank say that their reports from general trade are highly encouraging. There is more activity in every line of trade and this is beginning to apply to luxuries as well as to necessities. But with all this, money is accumulating. Domestic business has not reached that stage as yet where credit is needed, and interests devoting their time to war business receive 25% of the amount involved when they take the order. Gold continues to dribble this way all the time to pay for war supplies, and this will continue.

Southern Lumberman—Advances in quotations on yellow pine are being made with such frequency by most of the larger mills that it has become increasingly difficult during the past week to ascertain the latest prevailing prices. In fact, the market is subject to spottiness, due to these advances, and the prices secured for any item are determined largely by the stock which a mill has on hand and the promptness with which it is able to make delivery. Reports of greater volume of business in hardwoods and at somewhat better prices are received this week. Not only is there increase in the business of the current week, but inquiries are decidedly more numerous, and though in most cases single orders are for small lots as compared to the character of business in normal times, they are being received with sufficient steadiness to accumulate a far more satisfactory aggregate than at any previous time in the past eighteen months. While the market has during that time been subject to numerous fluctuations due to the changing aspect of international affairs, to unforeseen increases or decreases in demand for certain woods, the regularity with which the present business is being secured is proving most gratifying to manufacturers and dealers alike.

ATLANTIC SEABOARD

BOSTON

Better demand on contracts but no improved spot market as yet. Some contracts already closed for 1916. Georges Creek steady, but Pennsylvania grades show an upward trend. Water freights unchanged. Anthracite trade satisfactory.

Bituminous—While the Pocahontas and New River situation shows a distinct improvement this week at Hampton Roads the extra demand from this market has been confined to contracts. Several large textile mills have resumed full time and coal receipts are perceptibly larger. There is a good deal of talk about car shortage and its effect a month or two hence, but so far practically no spot business has developed. There is so much coal offering that buyers are not much impressed as yet by any prediction of scarcity.

Prices for inland delivery continue fairly strong considering the light demand. On the strength of recent efforts to place coal for the year beginning next April an amount of contract business has already been closed, but in almost every case with the merchant or agency having the business this current year. The price is understood to be a "sliding" one, up or down from $2.85 f.o.b. Hampton Roads according as the market turns. In other words, those who place contracts now are simply availing themselves of a very low charge for putting the coal on cars at Boston piers.

Georges Creek is still in ample supply at the loading ports, but far-sighted patrons of this grade are taking on what they can store in anticipation of shortages later. Usually this coal is the very first to feel a pinch. Prices so far are unchanged, and shipments are coming forward with usual regularity.

In the Pennsylvania grades there has been somewhat of a spurt the past week, particularly f.o.b. Philadelphia. Prices have hardened generally and on some of the favored coals there have been advances of 5@10c., that is, for shipment to New England. Some of the agencies are quite bullish in tone, attributing much to a shortage of labor in all the regions along with a shortage of cars and the possible suspension next April. New England has not as yet responded to this opinion and probably will not to any degree until Hampton Roads coals begin to advance in price, should that be the case.

Water Freights are unchanged this week from Hampton Roads, 80@85c. being the basis to Boston on boats of 3,000 tons upward. For New York loading for Fall River and New Bedford the current rate is firm at 50c., an advance of 5c. over a week ago.

Anthracite trade is brisking at wholesale. "Indian summer" is having its effect on retail demand, but good business is just ahead. Shippers with supplies of broken and the steam sizes have no difficulty making sales. The hard-coal situation all along the line is in wholesome shape probably for the balance of the season.

Bituminous quotations, f.o.b. loading ports at points designated, are about as follows per gross ton:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields	$2.25@2.75	$2.55@3.00	....	$0.95@1.50
Cambrias and Somersets	2.45@2.95	2.70@3.20	....	1.20@1.65
Georges Creek	2.92@3.02	3.22@3.32	$2.85@2.95	1.67@1.77

Pocahontas and New River prices, on cars Boston, are $3.55@3.73; Providence, $3.50@3.68, and f.o.b. loading port at Hampton Roads, $2.80@2.85.

NEW YORK

Movement on contracts heavy. Car and labor supply short. Exports decline. Concessions on anthracite practically eliminated. Mines on full-time schedules.

Anthracite—Trade during the week has shown further strength. Sufficient orders are in hand to keep operations going at full time. Notwithstanding, what is considered normal output is not easily obtained due to the shortage of labor. While demand has grown, labor supply has decreased due to the exodus of many foreign miners to their native countries and to take better paying positions with many of the steel and munition plants that are in a position to offer fancy wages. The car supply has also been short in some instances. Some of the companies that ship coal all-rail West at this season of the year are hindered at this time because of the short supply of box cars. Lake demand is good and these shipments are being made in the ordinary open coal cars.

Concessions in prices on domestic sizes are now rare and do not amount to more than 10 to 20c. a ton, as against 40 to 50c. during the dull summer season. Moreover, the cuts do not affect all sizes as was formerly the case. Now individuals are exacting premiums of 10c. a ton in some instances where coal is badly needed and buyers urge prompt shipments. Steam sizes continue very active, with supply decreasing for spot market needs.

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$5.20@5.30	5.35	$5.25@5.35
Stove	5.30	5.20@5.30	5.35	5.25@5.35
Chestnut	5.55	5.30@5.55	5.60	5.40@5.60
Pea	3.50	3.25@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.25@2.75	2.80	2.25@2.80
Rice	2.25	1.85@2.25	2.30	2.00@2.30
Barley	1.75	1.50@1.75	1.80	1.75@1.80

Bituminous—Contract requirements of bituminous are very heavy. The coke plants are calling for more coal than at any time in recent years, while many of the large manufacturing plants, some of which are now running day and night on war orders, are large consumers. Many small plants are coming into the market for fuel, and in the aggregate the demand is larger than it has been in many months. Export business is falling off because steamers are scarce, while bunker demand is improved because of the heavy movement of cargoes through all of the Atlantic ports.

Car supply was very bad last week on both Baltimore & Ohio and Pennsylvania lines. While there was a fair supply on Monday at many of the Pennsylvania mines, operators did not expect the supply to hold up for more than two or three days. Complaint is heard that some of the roads are not moving coal promptly when it is loaded; this is due to the heavy tax on motive power brought about by the heavy movement of all kinds of war munitions and the crops to the Eastern seaports. Slack has advanced in all regions.

Current quotations f.o.b. New York tidewater per gross ton are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85

PHILADELPHIA

Anthracite has good week with large orders. Car supply interferes. Stove leads as usual with egg fair and nut very weak. Pea strong at $2 and tax and buckwheat in good demand. Bituminous trade good. Railroads try to relieve car shortage with new equipment. Export quiet.

Anthracite—It is gratifying to record another active week. While the activity is apparent in the city trade, it is particularly true of the extensive surburban districts where shipments have been quite up to, if not beyond expectations. While the dealers are criticizing each other for not maintaining the prices, they are only following the example of the shipper for the past six months. Even now cheap coal is coming into the market, but probably in egg and chestnut sizes only. However, this causes no particular worry as there is always some coal sold off for some reason.

With the increase in business this week the car supply trouble has been greatly accentuated. Many companies are reporting extra large orders on the books and are prevented from making full shipments because of the lack of cars. This would not be so bad if there were any prospects of an early relief, but the general impression instead is that the situation will be worse as the season progresses. But even at that a number of companies are already claiming records for October.

Stove coal has been scarce among some shippers and free with none. Chestnut improves slowly, in fact, so very little that by some it is considered almost hopeless for some months to come. Egg coal is still dragging and causing the individuals, especially, some annoyance to get it off their hands without car service. Pea coal is strong at $2 and tax and some very large sales are recorded this week at that price, while a number of the companies are experiencing trouble to fill all orders. The price may advance, but as yet there has been no real sign of it.

Of the steam sizes buckwheat continues in fair demand, with rice just about the opposite. However, there is considerable storing of both sizes going on in the city at this time. Collections are in good shape; the large companies especially refuse to complain and are greatly pleased with the improvement shown the past few weeks. Good tidewater shipments of anthracite have again gone forward this week.

The circular prices per gross ton for line and Port Richmond shipments, but which do not include the state tax, are as follows:

	Line	Tide		Line	Tide
Broken............	$3.50	$4.75	Pea...............	$2.50	$3.25
Egg...............	3.75	5.00	Buckwheat.........	1.25	2.25
Stove..............	4.00	5.00	Rice...............	.85	1.75
Chestnut...........	4.15	5.25	Barley.............	.50	1.50

Bituminous—A number of large orders have been placed the past week and there does not seem any doubt now that the long expected boost is really here. The export trade is slowing down, as will be noted by the few charters that have been recorded lately. Since the domestic business picked up many shippers have ceased in their efforts to secure foreign orders, although representatives from various governments are in the city making inquiry almost daily. However, very little new business is being placed because of unusual conditions applying to this trade which the American shipper does not seem inclined to meet in the face of good business at home. The prices last week in the local market remained practically on an even keel and the following represents a fair average:

Georges Creek Big Vein..	$1.70@1.80	Fairmont gas, ¾.........	$1.25@1.35
South Fork Miller Vein..	1.55@1.65	Fairmont gas, mine-run..	1.10@1.20
Clearfield (ordinary).....	1.15@1.25	Fairmont gas, slack......	.75@ .85
Somerset (ordinary).....	1.10@1.20	Fairmont lump, ordinary.	1.05@1.15
West Va. Freeport.......	.95@1.05	Fairmont mine-run......	.95@1.00
		Fairmont slack..........	.70@ .80

BALTIMORE, MD.

Labor and car shortage forcing many producers from the open market. Exporting below recent standards.

Labor shortage is restricting productions and car shortage is also interfering with shipments. With the demand growing steadily more coal men are forced to withdraw from the open market. Not even urgent contracts are being taken care of as desired. Export trade has fallen below recent standards. Last week the total shipment on foreign account was but 20,234 tons.

Anthracite men would be content if they too could get through coal as desired. Less embarrassment is felt, however, than with the bituminous trade, due to liberal yard supplies on hand.

The bituminous market is gradually stiffening. Car shortage was again a very apparent factor. Prices were firm at the following figures:

	Mines	Balt.*	Fairmont	Mines	Balt.*
Geo. Crk. Big Vein	$1.75	$2.93	Ordinary mine run	$0.90	$2.28
Geo. Crk. Tyson...	1.40	2.58	Ordinary ¾.......	.95@1.00	2.43
Clearfield.........	1.25	2.43@2.48	Ordinary slack....	.75@ .80	2.08

* F. o. b., outside Capes.

HAMPTON ROADS

Shipments for week light. Little demand for coal for prompt movement. October tonnage showing considerable falling off.

Dumpings over the various piers at Hampton Roads for the past week have been somewhat light as compared with a few weeks ago. The movement to Italian ports has fallen off somewhat although there have been several cargoes to that port. The largest cargo of the week for an Italian port was 9,000 tons which went to Genoa; other shipments went to Torre Annunziata, Genoa and one cargo to Gibraltar for orders for an Italian port.

The government took a small amount of coal by collier during the week. The number of bunker vessels coming in was light. The Norwegian steamer "Roald Amundsen" took about 5,200 tons of coal for a six months' whaling trip South this being the largest quantity of bunkers loaded into any one vessel at this port for some time.

The accumulation of coal on the railroad yards is rather excessive although some shippers are short on particular grades. There is a fair amount of vessel tonnage about due which will cut well into the accumulation now on hand but unless the demand improves and some spot sales are made for immediate movement the dumpings for the month of October will be considerably less than was anticipated.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

	Week Ending				
Railroad	Sept. 18	Sept. 27	Oct. 2	Oct. 9	Oct. 16
Norfolk & Western....	182,047	163,400	131,055	140,934	......
Chesapeake & Ohio....	87,686	91,341	72,996	93,344	66,361
Virginian.............	59,597	79,176	59,997	65,150	54,964
Totals............	329,330	333,917	264,048	299,428

Fauna	Trinidad	728	

[1] 500 tons per day discharge.

OCEAN FREIGHTS

Very few steamers are offering for export coal, as owners can secure time charters for general cargo to same destinations at rates higher than coal shippers can afford to pay. When an occasional boat is offered for coal she is immediately accepted on one of the numerous coal orders in the market. It was reported a few days ago that London parties were offering $9.60 on coals from United States to Lower Plate ports, but we have been unable to ascertain whether or not this report is correct. We understand that some of the Plate consignees have purchased African coal to cover orders they originally intended shipping from here. We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana...............	$2.50@2.75	Bermuda..............	$3.00@ 3.25
Cardenas or Sagua......	2.75@3.25	Vera Cruz.............	4.75@ 5.00
Cienfuegos............	3.00@3.50	Tampico..............	4.75@ 5.00
Port au Spain, Trinidad.	3.50@3.75	Rio..................	**9.12**
St. Lucia..............	3.50@3.75	Santos	**9.12**
St. Thomas............	3.25@3.50	Montevideo...........	8.88@ 9.60
Barbados..............	3.50@3.75	Buenos Aires or La Plata	9.12@ 9.60
Kingston..............	3.00@3.25	Rosario...............	9.36@10.08
Curacao...............	3.25@3.50	West Coast of Italy....	14.40
Santiago..............	3.25@3.50	Barcelona.............	12.00@13.20
Guantanamo...........	3.25@3.50	Valparaiso or Callao....	7.50
Demerara.............	5.50@6.00	Marseilles............	13.20

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Domestic and line demand increased, making market slightly firmer despite impending end of Lake shipping. Car shortages more frequent with serious difficulties feared. Labor growing scarcer.

Conditions as to demand for coal are increasing at least rapidly enough to overcome the disturbance that usually develops as the Lake shipping season approaches its end. If it were not for this influence the coal market would probably be definitely advancing at the present time. Domestic demand is expanding with the season, though retail dealers are still buying chiefly from hand to mouth. Railroad consumption is increasing and some of the lines are now stocking considerable coal. The line demand generally is increasing.

The iron and steel industry, which apparently reached its possible maximum of coal consumption a few weeks ago, appears to be taking a little more for current consumption while it is likely that some stocking will be done in the near future, against expected difficulties in transportation in the bad weather. The steel industry can less afford to take any risks on fuel supply than at any time before when the steel market has been strong, as some of its products are selling at fancy prices and everything must be counted to insure maximum production every day.

Labor is growing scarcer with increased demand in so many quarters, but there is still some slack to be taken up by the men working fuller time. Car shortages are almost daily growing more in evidence and serious difficulties are anticipated before long. Thus far car shortages, while often reported, have hardly amounted to more than inconveniences.

Slack is up about 10c. a ton for prompt shipment, Youghiogheny gas usually commanding about 70c., and sometimes more, but Monongahela steam slack is available at about 10c. less. Mine-run and screened are not quotably higher but are firmer, particularly for free coal. We quote free coal: Slack, 60@70c.; nut and slack, 95c.@$1; nut, $1@1.05; mine-run, $1.05@1.10; ¾-in., $1.12@1.20; 1¼-in., $1.25; on contract to Apr. 1: Slack, 85@95c.; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

BUFFALO

Wave of bituminous activity coming slowly from Pittsburgh. Prospect of good movement next month. Car shortage spreading. Prices stiff.

Bituminous—The activity is visibly increasing, but is not as great as in the Pittsburgh district; in fact, it is doubtful if this market will equal the Pittsburgh district. All prices are strong, however, and the car shortage alone would be enough to insure firmness. It is reported that some of the leading Pittsburgh companies have made a higher price for the Canadian market, but there does not appear to be any advance ordered for Buffalo. The Pennsylvania R.R. is reported to be confiscating coal right along and there is not much report of consignment coal on track. In fact, the mines have all they can do to get the cars they need and to ship them out in time.

There is not much new activity eastward in the state yet; when the boom began there was a surplus of coal there which had to be worked off. Canada is also quiet as yet; all reports from there agree that the country is taking a much slower pace since the war. It will be hard to shake off this lethargy.

Bituminous prices are more firm from week to week, the following quotations prevailing:

	Pittsburgh	Allegheny Valley	Penn. Smokeless
Lump	$2.65	$2.45	$2.55
Three-quarter	2.55	2.30	....
Mine-run	2.45	2.20	2.30
Slack	2.20	2.10	2.30

Prices are f.o.b. per short ton to Buffalo and Rochester points and per long ton east of Rochester.

Anthracite—There is a steady increase of activity and the retailers are getting back to business. In another month the local trade should be up to the average. A new situation in the through anthracite trade is developing by the scarcity of box cars. This district makes a great part of its shipments in box cars. If they become very short the trade will be badly affected and the grain movement will also be cut down. Quotations are: Grate, $5.65; egg and stove, $5.85; chestnut, $6.10; pea, $4.30; buckwheat, $3.25; rice, $2.75; barley, $2.50; screenings, $2.25, all per gross ton f.o.b. Buffalo, with 25c. additional for delivery on board vessel. Lake shipments of anthracite for the week were 108,500 tons, a fair amount.

COLUMBUS

Strength developing in all departments. Steam increasing rapidly and prices have advanced. Retail trade active.

There is an increased demand for steam grades, due to the general expansion in manufacturing. All branches of the iron and steel industry are active and consequently there is a much better demand. Railroads also continue taking quite a good tonnage.

The domestic trade is also active and strong. Dealers are now buying better as their customers are requesting quick deliveries. Some of the retailers in Columbus have been compelled to put on additional men. Retailers' stocks are only fair and they are forced to place orders for replenishment. Practically all of the domestic orders are accompanied by a request for immediate shipment. Retail prices remain strong with Pocahontas and West Virginia splints in good demand. There is also a good demand for White Ash and Red Ash and Hocking lump is moving well. The advance in the circular of 10c. per ton made during the past week have been well maintained. It is likely another increase will be made within a short time.

Lake trade is rather active although the close of the season is approaching. Several of the Ohio shippers have finished their Lake contracts while others are still rushing a large tonnage to the head of the Lakes. Chartering of boats is about over for the season. Congestion at the upper lake ports is not as marked as formerly.

Car shortage on the Chesapeake and Ohio is delaying shipments. Some shortage of cars is also reported on the Norfolk and Western but not as bad as on some other roads. Ohio roads are in fairly good shape as yet but a shortage is anticipated.

Anthracite trade is increasing rapidly and prices are well maintained in Columbus and Central Ohio territory. The coke market is also growing stronger as manufacturing increases.

Prices in Ohio fields per short ton, f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.60	$1.65		
Inch and a quarter	1.50	1.50	$1.35	$1.50
Three-quarter inch	1.35	1.40		1.35
Nut	1.25	1.30		1.25
Mine-run	1.15	1.20	1.05	1.10
Nut, pea and slack	.70	.75	.55	.60
Coarse slack	.60	.65	.45	50

Mines have been working at about the following percentages of full capacity:

District	Week Ended				District	Week Ended			
	Sept. 25	Oct. 2	Oct. 9	Oct. 16		Sept. 25	Oct. 2	Oct. 9	Oct. 16
Hocking	50	50	50	55	Cambridge	45	45	50	60
Jackson	25	25	30	40	Massillon	45	45	55	69
Pomeroy	75	80	75	85	Eastern O.	75	80	80	85
Crooksville	40	40	45	50					
					Average	50	52	55	62

CLEVELAND

Car shortage restricting shipments, but prices remain unchanged. Heavy receipts over Sunday kept jobbers busy cleaning up, but the market well maintained under the pressure.

Four hundred cars came in over Sunday, shipments from the mines having come through without delay and very much bunched. Cars are not being furnished as fast as the mines could use them and shutdowns are the rule. Some mines have been closed down as much as three days a week. But there is a distinct tone of improvement. Some of the operators have withdrawn quotations for the time being on account of the car situation and others have added from 5 to 15c. to contract quotations.

The Lake trade is not shipping as heavily as it could if the coal could be obtained from the mines. The upper Lake locks are moving fairly good tonnages, and will go into the winter with enough soft coal to carry them through without any trouble. Anthracite shippers are sending an extra tonnage up the Lakes to be prepared for a suspension in the spring. The receipts of hard coal at Duluth-Superior are 80,000 tons ahead of last year, with soft coal receipts 1,200,000 tons behind last year and still falling off.

Jobbers are being quoted at the following prices f.o.b Cleveland per short ton:

	Pocahontas	Youghiogheny	Fairmont	Bergholz	Ohio No. 8
Freight rate	$1.45	$1.00	$1.15	$0.70	$0.90
Lump	3.70				
Lump, 6-in.				2.30	
Lump, 1¼-in.		2.40		2.10	2.15
Lump, ¾-in.		2.30	2.05	2.00	1.95
Egg	3.70				
Egg, 6-in				1.90	
Mine run	2.80	2.15	1.95	1.85@1.90	1.85
Slack		1.75@1.80	1.85	1.65	1.70

DETROIT

Gradual broadening of market and improved sales of steam coal. Domestic market reacts as result of higher temperature. Anthracite business light. Lake shipments below normal.

Bituminous—More general buying and renewal of orders give a more satisfactory aspect to the market for steam coal. Reduction in the sales of domestic coal are reported in consequence of the warmer weather. Little trouble is encountered in the sale of consignment stock, and while the supply of lump and egg seems more than adequate, the fine coals move quickly.

Anthracite—A scarcity of stove size and difficulty in obtaining sufficient cars of the required kind are the chief features of interest in the hard coal trade.

Lake Trade—Lake shipments are being handled almost wholly by freighters engaged in the iron ore trade. Vessels of independent fleets have been drawn into the grain trade and owners are unwilling to sacrifice the time that would be required in handling coal. The movement from the mines is somewhat restricted by lack of cars.

CINCINNATI

The car situation continues bad, with only about 50% of requirements, and prices have stiffened materially. Demand seems to be improving.

With a large deficit in storage supplies to be made up within a limited space, a car shortage of grave proportions will make this difficult. The Chesapeake & Ohio and the Baltimore & Ohio seem to be the worst off so far, but it seems that all of the coal-carrying roads, excepting possibly the Louisville & Nashville lines serving the eastern Kentucky district, are short of cars. Operators are able to move only a fraction of their output, in some cases only about 20% of the required equipment being available. As a result the market has stiffened, the steam trade responding particularly well. Unless more cars return from the Northwest it seems that the shortage will increase rather than diminish. Undoubtedly any cold weather at this time would send prices soaring, and might even cause distress among domestic consumers.

LOUISVILLE

Colder weather and car shortages have stiffened up the market. Operators cautious about future commitments.

A general stiffening of the Kentucky coal market under the influence of the car shortage, and the approach of the cold weather, together with improved industrial conditions, is reported by the Louisville operators. Eastern Kentucky mines are losing from two to three days a week and are reduced to a 60% schedule because of inability to get cars. Demand is showing an improvement and the movement is brisker. Operators are somewhat indisposed to undertake contracts for deliveries after the first of the year, it being considered that a general advance in labor costs is almost certain.

Sales during the week past, long ton basis, f.o.b. mines, have been made around $1.25 and $1.30 in Western Kentucky and $1.75 to $2.10 Eastern Kentucky for block, while pea and slack in Western Kentucky is still slow and different grades of Eastern Kentucky nut and slack have ranged from 25 to 40c. for low grades and 50 to 60c. for the best grades.

BIRMINGHAM

Coal trade some better though not as good as could be expected.

The coal business, both on steam and domestic lump, is better than it was thirty days ago, but there is still room for improvement. Shipments on contracts are satisfactory, but new business seems rather quiet. Lump coal is moving fairly good. Due to the small cotton crop, the oil mills throughout the South will have a short run this season, which will materially affect the tonnage of steam coal usually consumed by that class of trade. It is estimated that very few mills will operate later than the latter part of December, whereas, the season usually runs through March.

COKE

CONNELLSVILLE

Additional furnace coke contracting. Spot experiences sharp advance, giving operators somewhat higher views as to contracts. Production and shipments at new record for year.

Pickands, Mather & Co. have contracted for coke for one Toledo stack for the first four months of next year and for their two stacks at Erie and West Middlesex respectively for six months, while they still have to buy for another Toledo stack for the first three months of next year, the total coke being about 45,000 tons a month. The purchases for Toledo are timed to fill up until the byproduct plant at that point is completed. The price paid on the business closed is understood to have been about $2.25. Total contracting on this movement now amounts to fully 175,000 tons a month, for various periods, with a third or a fourth of the business still to be closed.

Last Friday morning it developed that overnight spot and prompt furnace coke had become very scarce, and $2.25 was bid freely not only for spot but also for any shipment this week, without bringing out enough coke to meet requirements, and at least $2.25 is being bid this week. It is said the chief prompt requirement is to tide over the Republic Iron and Steel Co. until its second block of byproduct ovens is operating, early in November, but spot coke may be $2.50 before the week is out, and the scarcity is inclining operators to ask more money on contract. Demand for foundry coke is only fair. We quote: Spot and prompt furnace, $2.25@2.35; November-December, $2.25; first half, $2.35@2.50; year 1916, $2.25@2.35; foundry: Spot, $2.30@2.60; contract, $2.40@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 9 at 417,724 tons, an increase of 20,135 tons, and shipments at 418,082 tons, an increase of 22,839 tons. The figures make new records for the year, and reflect one of the largest increases for a week over the preceding.

Buffalo—There is a steady increase in activity from week to week despite some report of over-production. Jobbers differ considerably in their reports of prices, though most of them state that they have paid higher prices this week than last. Shortage of box cars for foundry coke is reported. Best 72-hr. Connellsville coke in this market is not below $4.40, with $3.45 for stock coke.

Chicago—The coke market shows further strength. An advance of from 10c. to 15c. has taken place on byproduct foundry coke, and domestic sizes have stiffened. It is reported that considerable Eastern foundry coke is now being bought for this territory. Prices per net ton f.o.b. cars Chicago are as follows: Byproduct foundry, $5@5.25; byproduct domestic, $4.85@4.95; Connellsville, $4.85@5; Wise County, $4.85@5; gas coke, $4@4.15.

Birmingham—On account of the additional furnaces being put into blast in this district, there is a ready market for furnace coke, both beehive and byproduct, with prices around $2.75 for beehive 48-hr. coke and $2.25 to $2.40 for byproduct. Foundry coke is not as active as furnace coke, though the price is holding up.

MIDDLE WESTERN

GENERAL REVIEW

Domestic market shows increased activity screenings and steam coals stronger. Anthracite in healthy demand.

The domestic trade continues at an unusually brisk rate due to the early cold weather. The steam trade has also improved. Current shipments of all grades are being quickly consumed, so that stocks are not accumulating, and there is evidence that the demand is rapidly outstripping the supply. Rush orders are frequent and it is clear that the Western coal trade is in a flourishing condition. Salesmen making the Western territory report that not more than one-fourth of the normal volume of retail business has been done thus far and this undoubtedly means a lively demand throughout the balance of the year. Retailers have restricted local credits, and many of them are only doing business on a cash basis. Screenings are stronger; heavy absorption by large consumers has been reported, and a large tonnage of free screenings has been eliminated from the market. Some of the Western roads have advised operators that system cars can only be used for loading company coal.

CHICAGO

Demand good, car shortages developing and price concessions eliminated. Eastern coals short and orders urgent. Kentucky grades strong.

Franklin and Williamson County coals are in good demand, especially domestic sizes. Car shortages have developed on several roads, though not serious as yet. Williamson County coals are stiffening and all price concessions have been eliminated. Saline County operators are sold ahead on screenings for some time to come.

Springfield lump is sold as rapidly as produced, and screenings have been firm.

Indiana domestic grades are strong, and prices will advance as soon as another cold snap arrives; the output of these sizes is larger than it was this time a year ago. Retailers are maintaining full stocks. Railroads are ordering increased quantities but industrial consumption is still slow. Car shortages are reported here and there. Sullivan County screenings have eased off somewhat.

West Virginia smokeless shipments are scarce due to car shortages. Rush orders have been placed with the mines which cannot possibly be filled, and some of the dealers in the Chicago district are much alarmed over the outlook. Pennsylvania smokeless is stronger because of the lack of shipments from West Virginia. The splint market is in better shape.

Hocking domestic trade is lively, and retailers are buying in considerable volume. Much school coal is being covered. The demand for steam sizes is comparatively strong due to stocking by railroads and increased fuel requisitions from manufacturers. Circular prices are well maintained.

In the Kentucky field a better situation exists. Tracks have been cleared of surplus coals, and the outlook is more promising than for a long time.

Anthracite representatives in Chicago have been flooded with a rush of orders.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

INDIANAPOLIS

Indiana mines keep up active operation, though lacking the stimulus of cold weather. More mines opened.

There have been no material changes in the trade largely because moderate weather still prevails. Production, however, keeps up to its recent level and the market loses nothing of its strength. Railroads continue active buying and there is improvement in the volume of coal taken by manufacturing industries. Some additional mines have been opened after the summer idleness. Retail yards continue busy and some of them complain that they cannot get Eastern coals fast enough for their requirements. Recent prices still prevail. Some operators say that while working conditions are much improved over those of September and preceding months they are still selling practically at the summer price level.

ST. LOUIS

Colder weather has stimulated domestic business and urgent orders are being received. Increased production of screenings softens the market on that size.

A touch of wintry weather has stimulated the lump and egg market. Domestic users, who as a rule are six weeks later with their orders than last year, are sending in urgent orders for coal, and retailers have placed rush orders. Williamson County egg advanced to $1.50. The increased working time at the mines has reduced the price of screenings. The mines are operating four and five days a week. Carterville lump is somewhat scarce, while egg and No. 1 nut are a little slow. Country business was better on standard. All domestic sizes were moving more freely. Lump increased 5c. all around. There is practically no change in the steam situation.

Quotations f.o.b. mines ranged on the following basis per short ton:

	Frk. Co.	Wmsn. Co.	Staunton	Standard
6-in. lump	$1.50@1.75	$1.50@1.75	$1.25@1.50	$1.15@1.25
2-in. lump	......	......	1.15@1.20	1.05@1.10
3x6 egg	1.35@1.75	1.50@1.65	......	1.00
No. 1 nut	1.50@1.75	1.50@1.75	......	.85
No. 2 nut	1.40@1.50	1.40@1.50	......	.55@.65
No. 1 washed	......	1.65	1.40@1.60	....
No. 2 washed	......	1.25	1.10@1.25	....

No. 4 washed	......	1.20	1.05	
No. 5 washed	......	.60@.70	.50@.60	....
Screenings	.40@.50	.40@.50	.25@.30	.25@.30

Freight rates: From inner group of mines, St. Louis, 57½c.; East St. Louis, 37½c. From outer group, St. Louis, 72½c.; East St. Louis, 52½c.

DULUTH

Domestic buying brisk. Shipments show a steady and gradual increase. Bituminous arrivals less than last year.

Shipments to the country districts show a considerable increase over a year ago for this period, and with normal weather, shippers hope to see a still greater increase. With the cool weather now prevailing much interest is noted in the domestic sizes and inquiries are more frequent, but still colder weather will be necessary before any great activity can be looked for. Receipts are slightly larger than last week and the total for the season to Oct. 1 is: Anthracite 1,129,220 tons as compared with 1914 shipments of 1,070,800 tons and bituminous 4,750,145 as compared with 6,309,300 tons in 1914. Prices f.o.b. cars, Duluth, are as follows:

	Yough.	Splint	Hock.	Smokeless	Elkhorn
Lump	$3.40	$3.40	$3.40	$4.75	$3.75
Dock-run	3.10	3.10	3.05	3.25	3.25
Stove or nut	3.40	3.40	3.40	4.75	3.65
Screenings	2.40	2.40	2.25	2.75	2.40

Weather conditions have been favorable for the movement of a fair volume of anthracite to the retail trade. Dealers teams are in greater evidence on the streets than for some time past and the thrifty householder is laying away his supply of fuel for the winter. Dock companies quote f.o.b. cars per short ton as follows: Egg and stove, $6.85, nut, $7.10, pea, $5.55 and buckwheat, $5.55.

PRODUCTION AND TRANSPORTATION STATISTICS

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for May and the preceding three months:

	May		June		July	
State	1914	1915	1914	1915	1914	1915
Missouri	165,394	161,575	185,731	166,885	177,093	188,816

Total	2,238,432	100	2,106,083	100	4,294,407	100	3,907,312	100
Coke	25,010		21,181		46,970		46,214	

VIRGINIAN RAILWAY

Total shipments of coal over the Virginian Ry. for August, amounted to 411,090 tons, which compares with 381,853 tons for the previous month and 361,906 tons for August of 1914.

I. C. C. RULINGS

I. C. C. No. 5905—Plymouth Coal Co. vs. Lehigh Valley R.R. Co.

1. Defendant has justified its refusal to continue to furnish storage bins at Perth Amboy, N. J., for the free storage of anthracite coal.

2. Defendant's demurrage regulations governing anthracite coal awaiting trans-shipment at tidewater at Perth Amboy found reasonable.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

✚Indicates contracts regarding which official information has been received.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

✚1372—Latrobe, Penn.—All the bids on this contract (p. 446), which provides for furnishing the Derry Borough School Board with Jamison No. 1 grade mine-run coal, have been rejected and the coal bought in the open market at $1.10 per ton. Address Pres. J. D. Neely, Derry Borough School Bd., Latrobe, Penn.

1406 — Ogden, Iowa — Four bids were submitted on this contract (p. 448), which provides for furnishing the best grade lump and mine-run coal to be delivered in carload lots at the local school buildings, but all were rejected, and the Board has divided the business among local dealers, paying $3.35 per ton delivered. It is stated that the Board will be glad to consider prices from concerns to buy direct from the mines. About 150 tons is involved. Address Pres. D. A. Good, Bd. of Edu., Independent School Dist., Ogden, Iowa.

1497—Cleveland, Ohio—Bids have been received on this contract (pp. 577, 616), which provides for furnishing approximately 7,500 tons for the Cleveland Pumping Station, as follows: Valley Camp Coal Co., $1.67½ on No. 8 and $1.77 for Acme Pennsylvania coal; Moreland Coal and Coke Co., $2.05 per ton on West Virginia coal. Prices are in both instances for slack coal delivered in Cleveland as required. The price of the Valley Camp Co. is regarded as extremely low considering the outlook. Address Comr. of Purchases and Supplies A. R. Callow, 511 City Hall, Cleveland, Ohio.

1541—Scranton, Penn.—The bids on this contract (p. 617), calling for a supply of coal to the schols in this city, resulted as follows:

	High School	District No. 1			District No. 2			District No. 3			District No. 4		
	Buckwheat	Stove	Nut	Pea	Stove	Nut	Pea	Stove	Nut	Pea	Stove	Nut	Pea
Standard Coal Co.	$2.50	$4.20	$4.40	$3.25	$4.10	$4.35	$3.25	$4.20	$4.40	$3.25	$4.20	$4.50	$3.25
Carlton Coal Co.	2.70	4.25	4.40	3.50	3.85	4.10	3.50	....	....	....	4.50	4.75	3.50
Bull's Head Coal Co.	2.50	4.15	4.50	3.50	4.15	4.50	3.50	4.25	4.50	3.50	4.15	4.50	3.50

The James J. Kearney Coal Co. submitted flat prices for the delivery of coal in all districts as follows: Stove, $4.25; nut, $4.50; pea, $3.25; buckwheat for High School, $2.40. The award has not as yet been made. Address Secy. G. E. Haak, School Board, Administration Bldg., Scranton, Penn.

1510—New Orleans, La.—This contract (p. 577), which provides for furnishing the Louisiana Distilling Co. with approximately one car of steam coal per day, is now being closed. Address Purchasing Agent, Louisiana Distilling Co., 865 South Peter St., New Orleans, La.

1528—Memphis, Tenn.—Purchases on this contract (p. 616), which provides for furnishing the South Memphis Brick Co. with approximately 10,000 of No. 2 lump coal, will be made as required. Address Pur. Agt. John J. Bishop, South Memphis Brick Co., Madison St., Memphis, Tenn.

1545—Ocean City, N. J.—Bids have been received on this contract (p. 617), which provides for furnishing the Board of Education with its fuel requirements for the coming season, as follows: C. H. Shoemaker Lumber Co., nut, $7.35; pea, $5.60; Hedley & Adams, nut, $7.35; pea, $5.60. Address Secy. L. E. Smith, Bd. of Edu., Ocean City, N. J.

✚1549—Trenton, N. J.—Bids have been received on this contract (p. 617), which provides for furnishing and delivering approximately 3,500 tons of bituminous coal to the local Pumping Station and 300 tons to the Municipal Building, as follows: The James Oliphant Supply Co., Keystone stoker, $3.70; Hirsch Bros., bituminous, $3.85; the Tattersall Co., specified coal, $3.80; Thorne, Neal & Co., specified coal, $3.95. No award has yet been made. Address City Chemist A. Parobek, City Hall, Trenton, N. J.

New Business

1566—Cleveland, Ohio—The Cuyahoga County Board of Commissioners will receive sealed bids until 10 a.m., Nov. 3, for furnishing coal as may be required at the County buildings for the year beginning Dec. 21. About 30 tons of the best-grade Lackawanna egg coal will be required, 2,000 tons of Pittsburgh nut coal, and 100 tons of the best-grade bituminous lump. All bids must be accompanied by samples of not less than 25 lb. of coal it is proposed to furnish, and a certified check for $500 must be submitted with each bid. Address Clk. E. G. Krause, Cuyahoga County Comrs., Cleveland, Ohio.

1567—Hettinger, N. D.—The Adams County Board of Commissioners will receive bids until 10 a.m., Nov. 5, for furnishing lignite coal as may be required for heating the county building during the ensuing year. Bids should include cost of delivery in the bins as required. Address County Audr. Walter F. Kelley, Adams County Comrs., Hettinger, N. D.

1568—Bargaintown, N. J.—The Board of Education at this place received bids until 2 p.m., Oct. 21, for furnishing the schools at Bargaintown, Steelmanville, Scullville, and English Creek, with anthracite stove and nut coal as may be required during the ensuing year. Address Dist. Clk. William Hauenstein, Bd. of Edu., Bargaintown, N. J.

1569—Winner, S. D.—The County Government at this place will receive bids until 2 p.m., Oct. 28, for furnishing bituminous coal as may be required for use at the Court House during the coming winter. Address Audr. F. E. Wells, Winner, S. D.

1570—Goshen, Ind.—The Municipal Electric Light Plant at this place usually contracts for its annual fuel requirements during the latter part of November. About 3,500 tons of three-quarter lump coal is required and the customary price is approximately $2.60 per ton f.o.b. The business is done on competitive basis. Address City Clk. W. A. Brooks, Goshen, Ind.

1571—Ocean City, N. J.—The Department of Public Parks and Public Property at this place received bids until 1:30 p.m., Oct. 19, for furnishing coal as may be required at the City Hall during the ensuing year. Address Dir. George O. Adams, Dept. of Pub. Parks and Property, City Hall, Ocean City, N. J.

1572—Minot, N. D.—The Troy Laundry at this place received bids until 2 p.m., Oct. 15, for furnishing approximately 1,000 tons of lignite lump coal during the year beginning Nov. 1. All bids were to be f.o.b. cars at Minot. Address Purchasing Agent, Troy Laundry, Minot, N. D.

No. 1573—Philadelphia, Penn.—The City of Philadelphia is asking bids for additional supplies of coal on a deficiency contract (see also Contract 1516, pp. 577, 660), until the end of the present year as follows:

	Pea	Buck.	Bitu.
Belmont Pumping Station	6,900	2,300	.....
City Delivery	200	.....	.....
Mingo Creek Station	200	.....	.....
Belmont Filters	300	.....	.....
Queen Lane Filters	300	7,400[1]	.....
Spring Garden Pumping Station	100	.....	.....
Mt. Airy	100	.....	.....
Lardners Point Pumping Station	...	.....	17,000
Torresdale Filters	...	.....	8,500
Shawmut Pumping Station	...	.....	5,600
Georges Hill	...	400	.....
Roxborough Auxiliary	...	1,000	.....

[1] Pumping Station.

Bids will be opened at noon, Oct. 26. Proposal blanks may be had on application. Address, Director Herman Loeb, Department of Supplies, City Hall, Philadelphia.

1574—New Orleans, La.—The International Distillery Co., at this place, is in the market for their annual supply of coal involving approximately one car per day. Quotations should be made f.o.b. their switch. Address Pur. Agt. Kern, International Distillery Co., Pine and Ferdinand Sts., New Orleans, La.

+1575—Fountain Springs, Penn.—The State Hospital for Injured Persons will receive bids until Nov. 2 for supplying the Institution with coal during the year beginning Dec. 31. Complete information may be had on application. Address Supt., Dr. J. C. Biddle, State Hospital for Injured Persons, Fountain Springs, Penn.

1576—New Orleans, La.—The Lane Cotton Mills will contract some time before Nov. 15 for approximately 50 cars of steam coal. Address Pur. Agt. R. Lecorgne, Lane Cotton Mills, 434 Cadiz St., New Orleans, La.

+1577—Minneapolis, Minn.—The Glenn Lake Sanatorium Commission will receive bids until noon, Oct. 28, for furnishing approximately 1,000 tons of Pocahontas screenings. Deliveries are to be completed by Apr. 1, 1916, and all bids must be accompanied by a certified check for 5% of the amount bid. Specifications are on file at the office of the Secretary. Address Secy. Herbert O. Collins, Minneapolis City Hospital, Minneapolis, Minn.

+1578—Pittsburgh, Penn.—Sealed bids will be received until noon, Nov. 4, for furnishing and delivering coal to the Western Penitentiary during the year beginning Dec. 1. Bituminous coal is required, and quotations should be made f.o.b. cars, Rockville Station, on the Pennsylvania R.R. A certified check for $200 will be required with all bids. Address Supt. John Francies, Bd. of Inspectors, Western Penitentiary, North Side, Pittsburgh, Penn.

1579—New Orleans, La.—The Cosmopolitan Hotel will contract some time before Nov. 15 for their annual fuel requirements involving about 120 tons per month. Quotations are to include cost of delivery. Address Mgr., Major Stewart, Cosmopolitan Hotel, 120 Bourbon St., New Orleans, La.

+1580—Fort Slocum, N. Y.—Sealed bids were received until 9:30 a.m., Oct. 19, for furnishing and delivering coal in the bins or sheds at Fort Slocom as may be required by the steamer "General Barry" during the period beginning Nov. 1 of the current year, and ending June 30 next year. Complete information may be had on application. Address Capt. S. E. Smith, Quartermaster corps, U. S. Army, Fort Slocum, N. Y.

1581—New Orleans, La.—It is understood that the Leland Steamship Co. will contract some time in the near future for their annual requirements of coal involving approximately 50,000 tons of steam coal. Address Purchasing Agent, Leland Steamship Co., 1210 Hibernia Bank Bldg., New Orleans, La.

+1582—Erie, Penn.—Bids will be received until noon, Nov. 1, for furnishing the outdoor poor with anthracite and bituminous coal for the year beginning Nov. 2, and also for furnishing the Directors of Poor with the best quality three-quarter screened lump coal for the Erie County Almshouse for the same perior. Specifications are on file. Address County Controller Joseph E. Leslie, Erie, Penn.

1583—New York—Bids will be received by the Department of Docks until noon, Oct. 27, for furnishing and delivering approximately 2,000 tons of No. 3 buckwheat coal for use in the Borough of Richmond. For bids and awards on previous contracts of this department, see contract Nos. 935 and 1068. Full particulars may be obtained on application. Address Comr. R. A. C. Smith, Pier "A," New York.

1584—New Orleans, La.—The William Henderson Sugar Refinery at this place will contract for their annual requirements of coal, involving approximately 50,000 tons, some time before the end of the current year. A good-grade steam coal is required, and quotations should be made f.o.b. their tracks in South Peters St. Address William Henderson, William Henderson Sugar Refinery, 749 South Peters St., New Orleans, La.

1585—Montclair, N. J.—The State Board of Education will receive bids until noon, Oct. 30, for furnishing approximately 600 tons of pea coal and 60 tons of Lackawanna stove coal. Prices are to include cost of delivery in the bins at the schools as may be required. Address Chn. Melvin A. Rice, Normal School Committee, State House, Trenton, N. J.

1586—Pee Dee, S. C.—The Pee Dee Brick and Tile Co. will contract some time during November for their annual requirements of coal, amounting to approximately 700 tons a month. The business usually goes to the Stonega Coal and Coke Co. at about $2.40 per ton. The Pee Dee Co. has a storage capacity for 500 tons and deliveries are made by A. C. L. R.R. Address Pur. Agt. Edward Cox, Pee Dee Brick and Tile Co., Main St., Pee Dee, S. C.

1587—Jeanette, Penn.—The Jeanette Borough School District will receive bids until 8 p.m., Oct. 21, for furnishing and delivering coal to the various school buildings as may be required during the ensuing year. Full particulars may be obtained on application. Address Secy. J. C. Rovensky, Jeanette Borough School Dist., Jeanette, Penn.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+1339—Cleveland, Ohio—This contract (p. 410), which provides for furnishing approximately 4,500 tons of coal for the garbage reduction plant at this place, has been awarded to the **Morris-Poston Coal Co.** at $1.84 per ton. Address Dir. A. A. Benesch, Pub. Ser. Dept., 204 City Hall, Cleveland, Ohio.

+1341—Great Falls, Mont.—This contract (p. 410), which provides for furnishing the schools of District No. 1 with coal during the ensuing year, has been awarded to the **Wilbur Transfer and Storage Co.** on the following basis: Mine run coal, f.o.b. and city school, $2.38 per ton; lump coal delivered at county schools $3.85 per ton; lump coal f.o.b. yard, $3 per ton; lump coal delivered at Franklin School on the west side, $3.50 per ton. Approximately 1,500 tons of coal are consumed per year. Address Clk. H. A. Cary, School Dist. No. 1, Great Falls, Mont.

1435—New Orleans, La.—This contract (p. 490), which provides for furnishing the Canal Bank and Trust Co. with approximately 150 tons of bituminous coal, has been awarded to the **W. G. Coyle Coal Co.,** the business being negotiated somewhat earlier this year than usual. Address Pur. Agt. E. L. Kiefer, Canal Bank and Trust Co., New Orleans, La.

+1437—Osage City, Kan.—This contract (p. 390), which provides for furnishing the local Electric Light Plant, and other city departments, with coal during the period beginning Sept. 15 of the current year, and ending Mar. 15 of next year, has been awarded to **John A. Johnson** on Osage City shaft mine-run coal at $3.20 per ton. The Big Six Coal Co. bid $3.30 per ton for the same coal. Address City Clk. C. E. Johnson, Osage City, Kan.

+1448—Crosby, Minn.—This contract (p. 490), which provides for furnishing the local Board of Education with approximately 300 tons of coal, has been awarded to the **Mahlum Lumber Co.** at $4.67 per ton. Address Clk. J. E. McCoy, Independent School Dist., Franklin School Bldg., Crosby, Minn.

+1454—Sharpsburg, Penn.—This contract (p. 530), which provides for furnishing the local Board of Education with coal during the ensuing year, has been awarded to **John Ross,** at $2.10 per ton for ¾-in. lump coal. Address Secy. G. A. Speer, Bd. of Edu., Sharpsburg, Penn.

1456—Portsmouth, Ohio—This contract (p. 530), which provides for furnishing the County Infirmary with approximately 5000 bu of coal, has been awarded to the **Norfolk & Chesapeake Coal Co.,** at $1.65 per ton for mine-run coal f.o.b. Portsmouth. Address County Audr. Thos. C. Patterson, Portsmouth, Ohio.

1460—La Moure, N. D.—This contract (p. 530), which provides for furnishing La Moure County Commissioners with approximately 100 tons of coal has been awarded to the **Tanner Elevator Co.** at $6.23 per ton for Hocking Valley or Virginia splint coal. Address County Audr. O. C. Temple, La Moure, N. D.

+1467—Highmore, S. D.—This contract (p. 531), which provides for furnishing the fuel requirements during the ensuing year to the County Court House, has been awarded to **M. E. Miller Co.** on Youghiogheny coal at $7.35 per ton. Address Audr. L. W. Carter, Hyde County, Highmore, S. D.

+1471—Fort Worth, Tex.—This contract (p. 531), which provides for furnishing the Tarrant County Orphans Home with coal has been awarded to **Murphy & Anderson,** at $4.95 per ton. Address County Audr. J. A. Mulholland, Tarrant County, Fort Worth, Tex.

+1472—Alpena, Mich.—This contract (p. 531), which provides for furnishing the local Board of Education with coal as may be required during the ensuing year, has been awarded to **M. N. Bedford & Co.** on Youghiogheny three-quarter lump at $3.40 per ton delivered. Address Secy. Alfred E. Ash, Alpena Bd. of Edu. Alpena, Mich.

1475—Cincinnati, Ohio—This contract (p. 531), which provides for furnishing the Hamilton County Infirmary at Carthage, with approximately 1,500 tons of Pocahontas or New River mine-run coal, has been awarded to the **Reliance Coal and Coke Co.,** at $2.44 per ton. Address Clk. Albert Reinhart, County Comr.'s Office, Cincinnati, Ohio.

1481—Mandan, N. D.—This contract (p. 576), which provides for furnishing the local Board of Education with approximately 200 tons of screened deep-mined lignite coal to be delivered at the various school houses, has been awarded to the **Mandan Transfer Co.** at $2.29 per ton. Address Clk J. H. Noakes, Bd. of Edu., Mandan, N. D.

+1484—Sunbury, Penn.—This contract (pp. 576, 616), which provides for furnishing the County Government with 250 tons of anthracite pea coal, has been awarded to the low bidder, **George A. Nevin,** at $2.90 per ton. Address Controller Aaron Baker, Court House, Sunbury, Penn.

COAL AGE

Vol. 8 NEW YORK, OCTOBER 30, 1915 No. 18

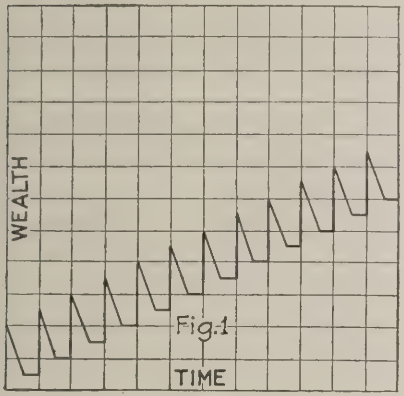

Fig.1

The Value of Thrift

What does the curve representing your financial condition look like? Does it show a gradual upward tendency or is it going steadily downhill?

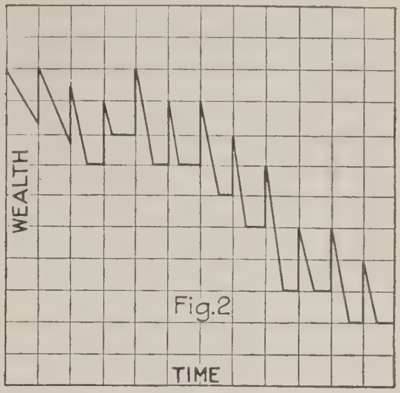

Fig.2

FIG. 1 tells the story of the wise man. He saves and provides for the future. Each payday comes and gives him a lift. He pays his bills promptly, and after his bills are paid, each balance is somewhat higher than the one before.

On the other hand, Fig. 2 illustrates the case of any number of persons. Here we see paydays coming at regular intervals, but followed by periods of temporary extravagance that result in a steady diminution of the capital of the thriftless person.

An industrial organization of any kind that does not plan for the future cannot exist for any length of time. Yet many families try to get along on the "feast or famine" principle that inevitably winds up in failure.

A young miner in the employ of a prosperous mining company recently remarked: "I don't see why I can't save any money. I'd like to save—that's certain. But for some reason or other I never have a cent two weeks after payday."

The time to think about saving is the minute when the pay envelope is handed to you—not two weeks later. The only practicable method of saving is to plan ahead and save first rather than last. The man who on payday lays by a reasonable and definite portion of his earnings is the one who accumulates wealth.

The person who thinks he will save what is left after he has lived for two weeks or a month on the proceeds of his previous pay seldom has anything left to save.

It is true that many families are enduring misfortune of one kind or another that prevents their saving anything. But there are countless others who are able and who know that they ought to save, but through indifference and lack of thrift they neglect the opportunity. On the other hand, it would seem that some persons have neither the ability nor the desire to save.

An incentive in the direction of economy is a carefully kept record of expenditures. If the person who thinks he cannot save will keep an account book for a month or two, or still better for a year, he will discover upon looking back over it that there were many useless expenditures that could easily be avoided in the future and the money involved could be invested or be placed to advantage in the bank.

An account book is useful also in planning for the future. With it one may readily estimate the proportion of his income required for necessary expenses, and thus determine the amount he may immediately take out of each pay to add to his savings. The importance of planning ahead cannot be over-estimated.

THRIFT MEANS GROWTH

The thrifty person grows in strength of character and in reputation. He provides for the future. A good name and a well-ordered life are things that are worth seeking.

South Africa's Interest in the South American Markets

By J. F. K. Brown*

SYNOPSIS—Coal in the Transvaal and Natal may be produced cheaply, and the labor supply is adequate and fairly steady. Although certain obstacles are to be overcome, it would appear that, despite its somewhat lower quality, South African coal could be laid down in South America at a price that would make it a strong competitor of both North American and English fuels.

In view of the discussions that have taken place on the possibility of an American export coal trade to the eastern seaboard of South America, it may be of interest to have a look at the resources of another country which has an eye on that business for itself at some time in the future—namely, South Africa.

A great variety of considerations help toward a country's success in an export coal trade, but of the more important considerations there are, first, labor—since this mainly determines the cost of production; second, the position of the mines governing the internal freights, and therefore costs at the point of shipment; third, the quality of the coal, which governs the price obtainable in the world's markets; and fourth, the volume of the internal trade—limiting in this particular case the total production of the country to a tonnage proportionately much lower than the possible gross production even with present equipment. This is a direct cause of the desire to look seaward for new worlds to conquer.

There is no ground upon which to base a comparison between coal-mining practice in South Africa and methods followed in the States, because the difference in essential features is great. There is a saying that "coal-mining practice is the same the world over," but like many other "sayings," it is only true superficially. An engineer accustomed to American practice, transported to South Africa, would find great differences on many points and would require to recast his knowledge and experience in order to judge the situation fairly.

The labor of South Africa is of course "black," but unlike the negro of the States, the black of South Africa only earns, roughly, 10 per cent. of the wages paid to the white man. On a month's work the black's wage will probably not be more than $15 to $20. The mine provides the rations, which consist of meal throughout the week and meat once on Sunday. As a gratifying addition some mines now and again add vegetables if they can get them.

Housing conditions are something on a par with the "quarters" of the negroes of the South in the days of slavery. A piece of ground is set apart, and on this either the company builds or the men themselves erect huts to suit their own taste. Those companies that build their own huts usually go a step farther and surround the compound with a wall and gate. They also attend to the preservation of order and cleanliness through an almost military organization. At times of tribal fights and other (sometimes nocturnal) diversions on the part of the black population, the usefulness of such compounds as these is evident.

Nevertheless the black man is not one whit behind his white brother in preferring his freedom, and those mines which do not draw the reins of control tightly and where a little freedom is allowed are better off generally in the supply of labor they control.

A SMALL HEADFRAME AND SCREEN HOUSE

VIEW OF COLLIERY OFFICES FROM HEADFRAME

The operation of the compound is under the eye of an official known as the compound manager whose duty it is to see that the blacks are well treated, that peace is preserved and that sanitary conditions are fulfilled—a very important matter in a hot climate. Under his guidance the men turn out to the shaft in the morning, and he investigates any cases of absence or supposed malingering. Through his report a mine manager knows before his men go down what places will be vacant.

Natives Are Fair Miners

As a rule the men make fair miners and if properly treated are faithful after a fashion. Harvest time in a country where work is a pastime to be avoided is of course always a period of scarcity in the labor market except with mines large enough to command great resources in recruiting. A "boy" well-treated will nearly always come back to the same mine after the agricultural work is done, and in many cases he will bring others of his own tribe with him. By attending to this point of fair treatment a steady stream of labor can be assured.

Many races go to make up the admixture of "boys" at any mine. All are not always peacefully inclined, and a preponderance of any particular tribe is always a pos-

---

*149 Park St., Sydney, Nova Scotia.

sible source of trouble. The larger operators have to put up with this condition as they cannot obtain a sufficient supply of labor entirely from one tribe. Smaller mines, whose requirements are less, are better able to get together boys from one district and to keep recruiting from the same area.

To keep up the supply of labor there is a system of recruiting in vogue. The country is divided, except in the outlying areas, into labor districts, a commissioner presiding over each. The recruiting practically amounts to the employment of labor agents, just as is the custom to a great extent in this country, and is equally as unsatisfactory from all points of view except that of the recruiting officers.

There are various terms of service agreed upon, ranging from six months to three years, the native having the choice in this respect; but once he has chosen, he is expected to stay out the length of time stated in the agreement. As a means to prevent his absconding, full particulars of his name, age, kraal, place of work and latterly in the actual labor areas his thumb prints are taken and registered with the commissioner of the district as being the distinctive marks of a "boy" employed by the mine designated.

The definition of a "boy" is any male native from 12 years of age to 80. Below 12 he is a "pickaninny"; over 80 he vanishes. A boy cannot leave one district for another without a written pass, and no ticket agent can issue a railway ticket without the production of this pass. Careful watch is kept on the coming and going of the natives, and any black man is liable to be asked by any police officer, and in fact in the outlying districts by any white man, to produce his pass. If it does not seem to be correct, he automatically goes to the police station.

Absconding Boys Are Promptly Detected

By these measures any runaway laborer is promptly trailed and the individual transported, even from a new mine where he may have started work, back to the place to which he originally agreed to devote his sole services.

In the coal mines work commences about 6 o'clock and continues till 6 o'clock at night. Usually the forenoon is the best work period. As a rule the native is of slight build, and although wiry, he does not last particularly well; consequently the most coal is obtained throughout the early hours. Depending on the seam and the conditions, an average of about two tons per day is produced per man employed underground.

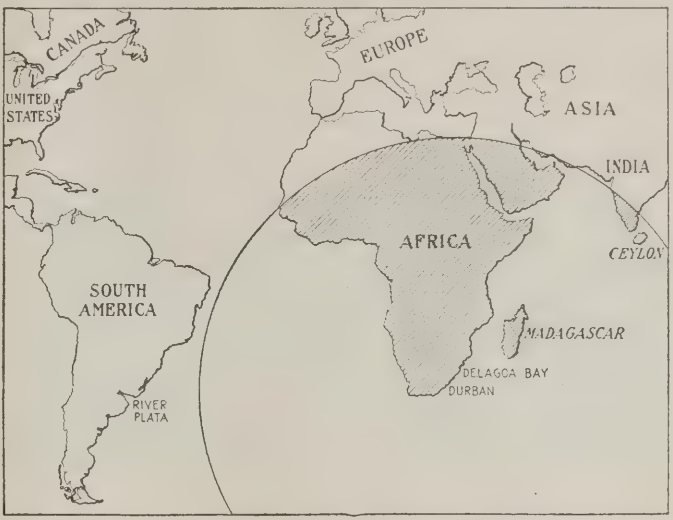
As miners the labor is fairly efficient, and the blacks are by no means devoid of intelligence. There are many tribes who seem to have a liking for machinery, and many good enginemen have been evolved for operating stationary, locomotive and hoisting engines.

It is against the law to have a black hoisting engineer, but nevertheless one sometimes comes across a native hoisting gayly and steadily throughout the day while his white boss and the proper hoistman may be sleeping off the "night before" carousal. To find that the blacks are capable in this respect is all the more creditable, since they have not been taught mechanics. Furthermore the language in use between the white and black does not permit of explanations on the subject of superheated steam or the uses of reversing gears. Consequently the black has to arrive at his knowledge seemingly by instinct and from watching the other man.

Under the conditions described the native exists practically as a prisoner on parole. This or some similar system is necessary, however, in order to obtain some measure of control over the native population. As a rule the black's sense of obligation is conspicuous by its absence, and his nature is largely migratory.

White labor in a black man's country is undoubtedly one of the curses of a manager's life and represents the uncertain element in the South African labor market. As a rule the white man occupies the position of a small boss, and if a good man he is well worth the high wages paid him. Fortunately for the coal-mining districts the proportion of white to black can be held low, under proper management not exceeding 2 per cent.—a fact which helps materially the cost of mining.

These conditions point to a steady labor supply that is cheap and must remain so for many years. As a consequence the South African coal owner can be reasonably sure that at the worst his cost of production will remain much at the same level for a considerable time. Any rise in wages will be slow—much slower than in coal fields operated by a white population. In other countries costs are constantly on the increase, but the South African producer will not suffer this misfortune.



SHADED AREA SHOWS WHERE SOUTH AFRICAN COAL COMPETES WITH THAT OF OTHER COUNTRIES

Mines Are High and Salubrious

The mines in the Transvaal stand on what is known as the high veldt, from 3,000 to 4,000 ft. above the level of the sea, and the climate is healthful. Outcrops of the coal beds are frequent in the "spruits" that cut into the geological arrangement of the rocks, but for the purpose of easy extraction are useless in comparison with other methods. As a rule the angle between the slope of the ground and the dip of the seam, if any, is only a few degrees. Above the coal there is more often than not a porous sandstone, which allows the water to pass through, causing great deterioration of the coal bed for a considerable area at the outcrop.

To reach a good coal from the outcrop usually means the driving of an open ditch up to half a mile in extent, in which the coal would begin as a seam of a few inches of a soft, mushy nature and gradually increase in thickness as the cover increased. As a rule the amount of water encountered is considerable but this depends on the rainfall. Above the seams the rocks are practically sandstone filters, and nearly all the rain water finds its way down through the roof into the coal measure.

The Transvaal coal field may be considered as one made up of thick beds, while Natal is possessed on the average of even a larger number, but not quite such thick seams. The bed most commonly worked around "Whitbank" in the Transvaal is known as the "Great Seam" and runs from 18 to 20 ft. thick. The cover is not great, about 80 to 100 ft., and the problem of the successful extraction of the whole of this coal is still something for the future to solve. No attempt has been made at present to take coal out in any other way than in rooms, 50 per cent. being the average extraction. The roof, commonly a sandstone or perhaps part of the coal itself, stands well, and places are frequently seen 20 ft. wide, 12 to 15 ft. high, without a stick of timber and with the roof perfectly sound.

The quality of the coal varies considerably, and in comparison with better-known seams on the American side of the Atlantic is somewhat poor, but not sufficiently so to disqualify it entirely in any market. The ash is fairly high and the calorific value lower in proportion.

A VIEW OF THE VELDT FROM THE BANKHEAD OF AN AFRICAN COLLIERY

Analyses of a few of the better-known coals from the various districts are given in the accompanying table:

ANALYSES OF A FEW SOUTH AFRICAN COALS

	Moisture	Volatile Matter	Fixed Carbon	Ash	Sulphur	B.t.u.
Cape Colony—						
Stormberg	1.77	9.22	68.44	27.34	0.97	.....
Stormberg	1.50	9.50	68.51	19.70	0.79	.....
Beaufort West...	...	21.7	76.2	2.14	0.86	12,740
Indwe	...	6.92	83.44	7.95	0.87	14,090
Orange River Colony—						
Vereeniging	5.67	23.21	50.94	18.25	1.94	8,950
Vereeniging	5.40	22.48	50.80	19.95	1.26	9,320
Transvaal—						
Springs	3.12	24.94	54.33	16.27	1.45	10,980
Springs	4.59	21.76	52.50	21.5	2.00	9,030
Middleburg	1.37	24.47	51.50	17.20	5.46	9,700
Middleburg	2.38	35.55	60.71	11.46	0.53	12,200
Middleburg	2.22	25.83	57.19	14.76	0.53	11,720
Middleburg	0.41	21.14	67.61	10.84	0.74	13,160
Middleburg	1.59	21.93	60.60	14.83	1.05	10,920
Middleburg	1.95	28.45	58.65	10.95	0.38	11,940
Middleburg	2.05	24.10	60.35	13.50	0.43	11,940
Natal—						
Newcastle	...	19.80	68.88	9.95	1.73	12,490
Newcastle	...	23.56	64.16	10.05	1.38	13,750
Newcastle	1.60	29.10	20.90	10.65	1.50	13,530

The coal measures are usually reached through shafts or, frequently, inclines. The beds are usually fairly level, and an incline driven at an angle of 20 deg. or more reaches most of the measures at a reasonable distance. In this slope either a conveyor or an endless-rope haulage is installed. With the first method, dumping is done underground, while with the latter the cars are hauled up in the usual manner.

This system has at least two important advantages: It dispenses with the necessity of an engineman, which in the case of the endless haul is a white engineman, and secondly, it provides an incline, which is safer than a shaft. Slopes are typical of Transvaal practice where conditions are suitable, but in Natal, with deeper seams, shafts are more common. Extraction is almost invariably by the room-and-pillar method, with small pillars and large rooms. The results of the working cannot be called economical, inasmuch as the percentage of round coal produced is low. The following figures represent an average of what is the usual standard attained by some of the larger companies:

	In the Transvaal	In Natal
Round	43% to 44%	65%
Nut	17% to 16%	15%
Pea and duff....................	14% to 16%	7%
Pickings	26% to 24%	13%

As there is practically no sale for pea, duff or pickings, except a small amount to the power companies at a price around 12c. per ton, the majority of the companies are compelled to dump this material, and as most of the coals contain a fair proportion of sulphur, spontaneous combustion takes place as soon as the heap reaches about 10 ft. in height. The result is that nearly all these coalbanks are on fire and may be seen burning for miles across the veldt.

As the coal district is mainly in a woodless country, the mines have either to import the needed timber or else grow their own supplies, but until the timber growth is sufficient for mining purposes (from 5 to 7 years) present supplies must be bought at a high figure. Tree planting is now being done by many of the collieries.

South Africa Wastes Its Natural Resources

Conservation of the fuel supplies is a subject that has been discussed in the abstract, but like all developing countries South Africa is prodigal of its native resources. In one way this is easily understood, as the country is vast and in many parts practically unexplored; consequently the store of coal appears inexhaustible.

The carboniferous rocks in which the coal beds are found stretch from Laingsburg in Cape Colony in a northeasterly direction 750 mi. to Middleburg in the Transvaal and at right-angles to this from Kimberley to Umtata in Cape Colony, a distance of 350 mi. This gives for the carboniferous system a total area of about 262,000 sq.mi. It is as yet unknown how much of this area actually contains workable coal beds—undoubtedly much of it is barren; but coal is at present being operated in four distinct regions—the Natal coal field, the Transvaal coal field (Middleburg), the Orange Free State area (Vereeniging) and the Cape Colony area (Stormberg). There is a distance between the Natal and the Cape areas of 350 mi.

Last year the Geological Survey of the Union of South Africa gave the following rough estimate of the coal resources:

District	Area, Sq.Mi.	Average Thickness, Ft.	Total Tonnage
Transvaal	5,000	6	36,000,000,000
Natal	1,000	7	9,400,000,000
Zululand	1,250	4	6,000,000,000
Orange Free State.....	1,000	4	4,800,000,000
Cape Basuto-land.....			
Zwasiland			
Total			56,200,000,000

Since the location of new coal fields has little attraction under present conditions for either private or collective enterprise or the state, it follows that as there is no incentive to exploration the foregoing is a conservative estimate and is only applicable to those areas in which actual operations are at present being carried on. Further, it is to be remembered that most of this coal is easily mined, as capital expenditures are low and working-costs even less in their proper relations. Mining-costs, as may be expected, are reasonable and may be held to average roughly for the Transvaal 48c. per ton and for Natal 70c. per ton.

Owing to the excessive competition of past years, through easy production, the price of coal to the consumer is as low as anywhere in the world. For many years this has averaged much as follows, taking into allowance various fluctuations: Round coal, $1.16; pea, 12c.; nut, 70c.—all at the mine mouth, and averaging per ton at the mine possibly 67c. in the Transvaal.

Mines and Railways Use Most of the Coal

Of the coal sold the larger quantity is consigned to the mines and railways on a well-defined calorific basis, while the remainder goes to the householder trade of the few cities—Johannesburg, Pretoria, Lourenço Marquez, Pietermaritzburg and Durban. The total internal (Transvaal) consumption is limited to around 5,000,000 tons annually, little enough to feed an ever-growing number of mines, while the total for the Union approximates 7,500,000 tons. Natal has practically no internal consumption and caters almost entirely to a bunker trade at Durban.

With the easy operation of the coal seams, the price of coal was at first only kept from going lower by the fact that railway routes are few and freight rates high.

Latterly and with various vicissitudes, coöperative bodies—the Transvaal Coal Owners' Association and the Natal Coal Owners' Association—have come into and have gone out of existence. The final success of such a body is always problematical, as their troubles are many in a land where coal mines are easily opened. Such an association is usually a corporate body in which the various companies hold stock. They work along the line of pooling the output to regulate the price and conserving the market for the benefit of the collieries concerned.

Coal is sold to these associations by the mines at fixed prices and a certain stipulated tonnage worked, the total trade being divided among the companies concerned pro rata. Any increase in tonnage sold by the association is also divided, but any increase in price goes to the association's benefit and returns to the mines as dividends on stock. Such a combine, as it has been well named, has been of great service.

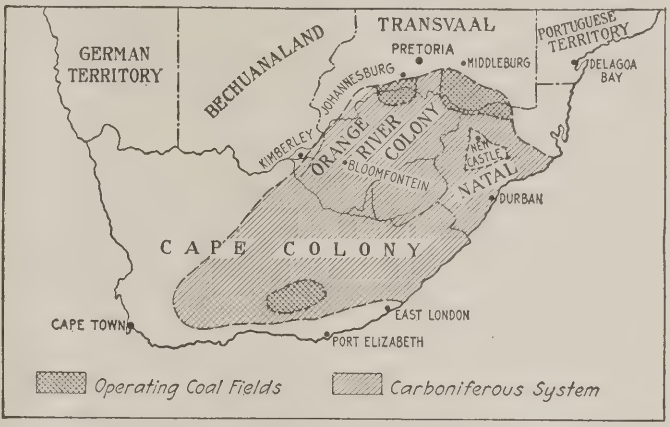
It is a common feature, however, to find within a year or two other operators appearing in the field and demanding their share of the "turnover," and so rifts within the lute develop that may ultimately lead to the dissolution of the association, which then possibly remains in abeyance until matters become so bad as to compel the formation of a fresh combine. This has occurred several times in the history of the Natal and Transvaal fields.

A Combine Has Been an Accomplished Fact

But it is important to note that such a combine comprising a great number of scattered collieries, with many conflicting interests (capital stock in South African, French, German and English hands; control in some cases held by steamship lines, gold-mining companies, diamond companies, independent companies; some concerns 100 mi. nearer the market than others—conditions many and varied), distributed over the huge coal fields in the Natal and Transvaal, has been actually accomplished and operated successfully, and admittedly to the profit of the participants in the pool. Recently there has been discussion of a combine of interests between the Transvaal and Natal, and such a combine, when it takes place, as it probably will, will actually represent an agreement among all the South African coal-mining interests.

Believers in the future of South Africa are great advocates of the development of an export coal trade. The facts that there are such large known reserves of fuel, easily and cheaply worked, and that the internal industrial market—which with the exception of a few cities is mainly the consumption in the gold mines—is not equal to absorbing the surplus production, have compelled a serious study of the question and aroused interest all over the Union.

Export trade for the Transvaal must be conducted through the port of Delagoa Bay, in Portuguese territory, 270 mi. away. Until recently this has been out of the question, as that port had no means of handling an export trade of any dimensions. There now exists, however, a fair coaling plant at this point, and the output of the Transvaal collieries to an oversea market has been going steadily up.



THE AREA OCCUPIED BY CARBONIFEROUS ROCKS IN THE UNION OF SOUTH AFRICA

The coal finds a market in India, against the native-produced fuel, in Ceylon and Madagascar, against Japanese, Australian and British coals; and now that the possibilities of an export trade in this direction have been demonstrated as profitable under present freights and costs, efforts for its increase through increased facilities and closer coöperation may be expected.

The Natal coals find a market through the port of Durban, 240 mi. from the coal fields, and while the output approximates only 3,000,000 tons, by far the greatest quantity (80 per cent.) is taken as bunker fuel. There has been in the past little export trade carried on. Natal coal also finds its way to the Capetown market in competition with Welsh and English coals, but the price obtained is less than for the Welsh coal owing to a lower calorific value. Welsh coal sells at $5.70 f.o.b. Capetown, while Natal coal sells at $4.60.

As already hinted, an export coal trade is a "South African dream." The proposal has been made more than once, and seriously considered within the last few years, that given a community of interest between the countries comprising the Union, Natal coal could find a market on the west coast of Africa and the east coast of South America, leaving the eastern market to the Transvaal.

It was calculated that the coal cost on board at Durban per ton would be from $2.60 to $2.90, and that given reasonable freight rates, this would enable it to compete with the coal at present enjoying the markets above mentioned. As the South African railways are government owned, state aid was to be secured in obtaining lower coal-carrying rates from the coal fields in Natal to the port itself.

There Are No Return Freights

The South American market has looked good to South African eyes for many years, but there is a difficulty which centers round the question of return freights. South Africa and South America are two countries similar in situation, in climatic conditions and in industrial and agricultural progress. The result is that neither country produces any material nor has any industry the product of which the other country needs. South America can send to South Africa nothing in exchange as freight for the returning coal bottoms.

To obviate this difficulty a round trip of the vessels engaged in the trade has been suggested—South Africa to South America, South America to England, and from England back again to South Africa. This is feasible, but on the other hand it is hardly conceivable that the movement of cargoes will so coincide as to allow of the steady invasion of a coal market all the year round.

The relative distance of the ports of coal shipment from, say, Montevideo, is approximately as follows: Durban to Montevideo, 4,000 mi.; Hampton Roads to Montevideo, 5,500 mi.; Swansea to Montevideo, 5,900 mi. mi.

Thus freight rates favor the Union on the distance. Calculating the cost of the coal on board at Montevideo, on the basis of freight rates plus cost delivered at shipping point, the relative selling prices would appear as follows:

	Welsh Coal	Virginia Coal	Newcastle Steam	Natal
Price at point of shipment	$4.50	$2.80	$3.28	$2.95
Freight	3.10	3.60	3.80	2.50
	$7.60	$6.40	$7.08	$5.45

While in no sense can these figures be taken as actually comparative, since freight rates and prices are subject at all times (and especially now) to considerable fluctuations, nevertheless they seem to show that South Africa's claim of being able to reach the South American market at competitive prices is not unjustified.

A Résumé of Conditions

It would therefore appear that, given strong combination, backed by the state, and reduced rail rates, South Africa would have a more than reasonable chance of obtaining a considerable share of the South American trade. Further, a South Africa combine, determined on expansion through export trade, would be a powerful factor in obtaining and forcing the freight reductions necessary, both on the sea and overland. The completion of plants at the coaling ports is a step on the way to the trade desired.

Again, the number of collieries catering under this system to an export trade would have the advantage of assuring quick loading, prompt dispatch and, above all, uniform, well-graded quality. There is nothing to prevent such an association, while there is on the other hand the example of a successful precedent.

The coal trade generally is gradually being forced into the position of having nothing to lose and everything to gain by the consummation of the many-times-suggested combine. The special features brought forward have been:

(a) The pooling of all internal trade and the hoped-for export business.

(b) The allocation, according to production, of the Indian and East African coast trade to the Transvaal mines through Delagoa Bay.

(c) The allocation of the Capetown seaboard, West African coast and South American coast to the Natal mines through Durban.

(d) The construction of strategic railway lines for the transport of export coal and the reduction of freights to the sea from the mines.

(e) The construction of coaling piers at the two ports and the organizing of a shipping fleet.

In a few words, South Africa's feeling is that the Coal Owners' Association, the government and the railways have "a unique and obvious opportunity to promote industrial expansion at the expense of oversea competition." The Union produces cheap, easily worked coal, of which there are great reserve areas, while every problem within its borders can be overcome. The existing mines are equipped for producing approximately 2,000,000 tons annually above their present output, and with an export outlet available production from fresh areas would be prompt.

Only one difficulty bars the way: South Africa is in the same position as the United States in that she has not the vessels with which to carry on her coal trade and has less chance of obtaining them owing to the dearth of return cargoes. It is true that the average quality of the coal is lower than that of the fuels with which it will have to compete, and the export range of any coal depends in these days strictly upon its value as a fuel. But seemingly South Africa has a margin to come and go on in this respect.

Coal in the Russian Caucasus

The coal industry of the Caucasus is in its infancy, but is capable of considerable development. Traces of coal are found in many of the governments of this district. Perhaps the most important known deposit is at Sosooze, in the government of Kars. This deposit covers an area of more than 300 sq.mi., and the coal is reported to be of uniform quality and high grade. Serious prospecting work was started only in 1914. The concessionaire has also been granted a concession for the construction of 60 mi. of railroad from Sosooze to Kars.

The retail price of local coal at Tiflis averaged during the year $9.58 per ton, and the price of Donetz coal at Tiflis in 1914 ran from $22.35 to $23.95 per ton. During December, however, prices rose by 50 per cent. The output of coal in the Donetz Basin increased during 1914 by 19 per cent. and of anthracite by 25 per cent. The consumption of coal by local railroads increased by 22 per cent. Of foreign coal 445,171 tons was imported into Russia for the use of the railroads, duty free, during the first six months of 1914.

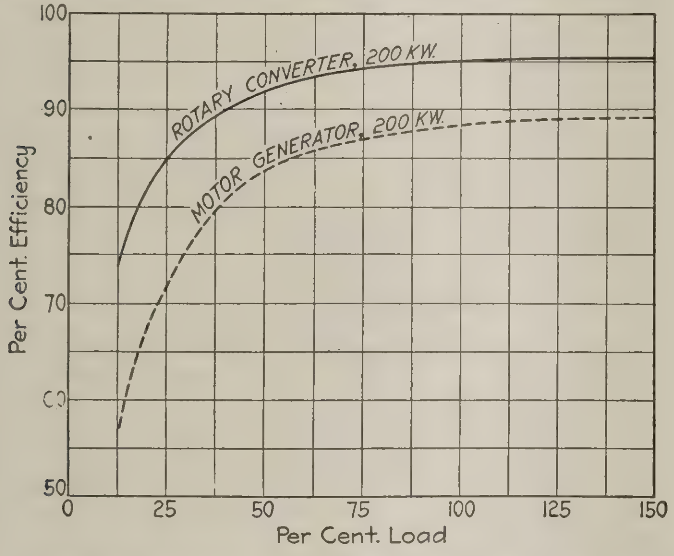
The Rotary in Mine Work

By C. M. Means*

SYNOPSIS—Of the two methods available for converting alternating into direct current the rotary converter of recent design possesses some important advantages over the motor-generator set. Among these are greater simplicity and greater overload capacity.

Direct current is eminently suited for the operation of certain appliances used in the production of coal, while alternating current is the better medium for power transmission. Up to this time, haulage locomotives arranged for alternating current have made little progress, and a successful mining locomotive of this type is not yet in sight. Mining machines are now being built with alternating-current motors, but they have a limited application because of the inherent characteristics of the induction motor.

In small mines where no haulage is contemplated it may be advisable to use mining machines equipped with induction motors, but where haulage is already installed or its future use is possible, it is advisable to consider only machines operated with direct-current motors. Other equipment such as pumps and hoists can be run successfully with alternating current applied at the transmission voltage, or by the use of transformers such voltage can be secured as may be most desirable.



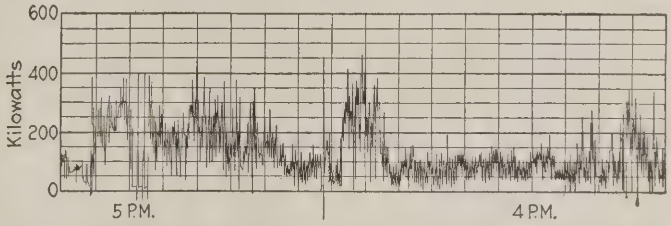
CURVES SHOWING THE EFFICIENCY OF A MOTOR-GENERATOR AND A ROTARY CONVERTER

The potential of direct current is limited to 650 volts, and in the interest of safety it is often desirable to make the limit 300 volts. For transmission purposes underground, alternating current at much higher pressures may be used, the exact voltage being dependent upon the length of the distribution lines and the amount of power to be transmitted.

In order to get proper results in a large mine, it is necessary to transmit the power in the form of alternating current, converting it to direct current for the operation of locomotives, mining machines, small pumps, etc. To accomplish this conversion, we have our choice between the rotary converter and the motor-generator set. In recent years the motor-generator set has been so improved that it is now a rugged and reliable piece of apparatus and has been applied extensively in many districts where alternating current is available. Recent developments in the rotary converter, however, have not only made this device a competitor of the motor-generator set, but present indications point to its adoption in mining work in preference to the other machine.

Machines used for converting alternating into direct current are rated on their ability to carry a constant load rather than to take care of the actual operating cycle of a mine. A mining load is extremely unsteady, and machinery adapted to carrying wide fluctuations should be selected for the conditions existing in the average mine.

In the case of a motor-generator set, the capacity of the machine is limited by the ability of the motor to keep in step or that of the generator to commutate at overloads. The usual practice is to arrange the motor so that it will, under proper conditions, carry well up to 100 per cent. overload, but this implies a normal alternating-current voltage which cannot always be maintained. Manufacturers customarily design the direct-current unit to carry 75 to 100 per cent. momentary overload without serious flashing at the brushes.



WATT-METER CURVE; TYPICAL FLUCTUATIONS OF A MINING LOAD ARE SHOWN

Momentary Overload of 200 Per Cent. Is Possible

In the case of a rotary converter, the only limiting feature of short overloads is that of commutation, and in a properly designed machine it should be possible to carry 200 per cent. overload for short periods of time.

Inasmuch as the overloads are of short duration, no undue heating occurs in the winding of the rotary or of the transformers used in connection with the outfit.

The accompanying chart shows a typical direct-current mining load. In actual practice it was found necessary to use two 150-kw. motor-generator sets to handle this load, yet it could easily have been carried by one 200-kw. rotary converter of proper design.

In certain cases it is possible to arrange the work so as to reduce overloads, but in general an arrangement that would give any material overload reduction would so affect the operation of the mine as to result in decreased output with increased cost. This implies that the load ordinarily encountered in mine work is a fixed condition and equipment must be designed to handle a demand fluctuating between wide limits with a low average value as compared to the maximum. This condition the rotary is eminently fitted to meet.

---

*Randolph-Means Co., Pittsburgh, Penn.

The first cost of a rotary converter, together with transformers, designed for a certain continuous load, may be slightly higher than that of a motor-generator set, but the cost of a rotary to handle the average mining load should be lower than that of a motor-generator set to perform a like cycle of work. This is because of its greater overload capacity. The reliability of operation favors the rotary converter of recent design as compared to the motor-generator set. Transformers are extremely reliable in every way, and the rotary has a low-voltage field and armature winding and is one machine.

The synchronous motor of a motor-generator set usually has a high-voltage winding and a revolving field that must be insulated for high induced potentials. The field and armature winding on the direct-current end, in the case of 500-volt machines, must be provided with an exciter. Thus we have two complete machines in the case of 250 volts and three in the case of 500 volts.

The efficiency of the rotary together with its transformers is high, reference to the curves showing just what this value is. When the load under which these machines operate is considered, it is apparent that the saving in power in a rotary is an important item and cannot be ignored. The actual operating efficiency of a motor-generator set on a mining load will be around 70 per cent. or lower, while that of a rotary with its transformers should be 80 per cent. or above.

It is possible to secure considerable overcompounding on the direct-current end of a motor-generator set, while a rotary will give a flat voltage or a very small amount of overcompounding. The direct-current voltage of a motor-generator set is a fixed quantity and cannot be varied beyond the limits fixed by its design. The voltage of a rotary can be varied by changing transformer taps.

A flat voltage is exactly what is required when a substation is located properly with respect to its work. Thus in general, the regulation of the direct-current voltage of a rotary is better suited to the work than a voltage that fluctuates with the load.

The rotary converter operates at about unity power factor, which is ideal so far as this part of the load is concerned. If it is desirable to correct the power factor for other apparatus on the line, a proper condenser should be used and so located as to furnish the maximum amount of effective correction rather than depend on synchronous motor-generator sets placed without regard to location for proper correction of power factor and operated without consideration of the amount of correction required at different times.

⁂

A Cold Winter Coming?

The sale of what are known as fire goods—that is, stoves and furnishings, pokers, tongs, coalhods, stove boards and the like—is always a gamble with the weather so far as the merchants in these lines are concerned. Both the wholesaler and the retailer must place their orders far in advance if they are to have the goods when needed.

The volume of business depends largely upon two factors—the amount of goods carried over by the retailers from the previous season and the nature of the weather in November and early in December. An early cold snap, especially if severe and prolonged, means a great volume of buying by the householder. If, however, the cold weather be delayed until after Christmas, it apparently has no effect whatever upon business.

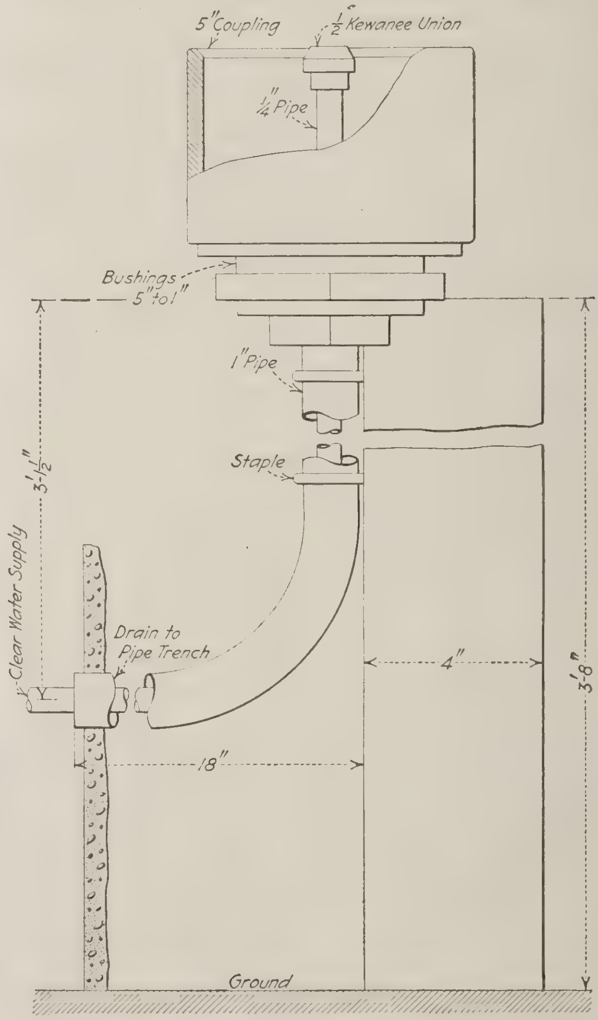
After Christmas, be the cold ever so pronounced, the consumer evidently makes up his mind to get along with such heating apparatus as he has for the remainder of the season rather than buy new ones. This year the whole body of the trade is banking on a cold winter, judging from the volume of its buying. This judgment has the merit of consistency, since the past three winters have been rather mild and in the general law of averages a cold season is due.—New York *Times*.

⁂

Drinking Fountain for Mine

By D. E. Charlton*

The fountain illustrated herewith is simple in construction, applicable for underground or surface use and may be made from material generally on hand at the mine, says *The Engineering and Mining Journal*. The cup is made of a 5-in. coupling bushed at the lower end and reduced to connect with a 1-in. pipe which acts as a drain, taking care of the overflow of water. The fresh water enters through the ¼-in. pipe that passes through the 1-in. pipe. The male end of a Keewanee union will serve as a suitable nozzle. The apparatus is supported and held to a wooden post by means of staples.



A SIMPLE DRINKING FOUNTAIN

Simple Cement Testing

By E. H. Bonnet*

SYNOPSIS—Most large consumers of cement employ elaborate tests on this material before using it. This is not generally the case with coal companies. Two tests, one with the thumbnail and the other with a pailful of boiling water, may go far toward determining the adaptability of any shipment of cement for the purpose intended.

Concrete is being used more and more extensively every day. It has long been employed in building construction, but it is only within comparatively recent years that it has been much used around mines. The development of its use in colliery practice has, however, been rapid; and it is now employed in a variety of ways, such as in building bridges, houses, tipples and breakers, as well as to a large extent for engine, fan and pump foundations, brattices, overcasts, entry and tunnel linings and in numerous other capacities where the quantity used at any one time is small, but which in the aggregate constitutes a considerable amount.

The principal constituent of concrete is cement—not in quantity, but in importance. It may seem needless to say that not all cement is good cement. It is, however, not like a great many other materials the quality of which can be determined by sight inspection. A bad cement appears the same as a good one. An adequate test is important, since the uses to which cement or concrete is generally put are such that a failure would entail a large loss.

Most architects, large building contractors and the larger railroads test all the cement they use, but it has been my experience that little of this material used in and around mines is tested. This may be owing in large measure to the cost of having the cement tested and also because of the delay in waiting for the chemist's report. Probably also it arises from a lack of knowledge on the part of mine managers and engineers concerning the importance of testing. To them cement is cement.

I have in mind one coal company which maintains a large and efficient corps of chemists for testing coal, oil and mine air, yet still in an important and expensive structure it used 5,000 bbl. of cement without testing. I have also known of shipments of cement which were rejected by one purchaser, being sent to and accepted by other parties who did not test the cement they used.

The American Society for Testing Materials has formulated some elaborate tests for cement, and all such material should be bought with the specification that it must pass these tests. There are a few simple trials, however, to which cement may be subjected that anyone can apply with simple apparatus and that for all ordinary purposes give dependable results.

Method of Procedure

First a sample of the cement must be secured. The taking of this sample depends largely on the quantity of cement to be tested, but in most cases a small amount should be taken from every tenth barrel or sack in the shipment. These samples should then be mixed together, the total quantity taken being about 10 lb. This should then be thoroughly mixed and about ½ lb. taken for the test.

This should be mixed with water on a piece of glass about 18 in. square and worked, just as bread is kneaded, into a paste of about the consistency of putty. This kneading should take about 5 min. If after kneading, the paste is worked into a ball and dropped a distance of about 2 ft. to the mixing board and water spatters out, the cement is too wet, while if the ball cracks it is too dry. The proper amount of water can be determined with a little practice. It will vary somewhat with different cements, but will ordinarily run close to 25 per cent. of the amount of cement used.

This paste is then made into two pats or mud pies on pieces of glass 4 in. square, the pats being 3 in. in diameter, about ½ in. thick in the center, and running down to thin edges. The pats are then put in a moisture box. This may be easily made. It is simply a box with a fairly tight lid, capable of holding water, with a tray to hold the pats above the liquid. If no moisture box is at hand, the pats can be kept moist by wrapping them in damp cloths.

One pat is from time to time tested for setting. This is done by using the thumbnail. When an impression can no longer be made with the nail, the pat is said to have set. This set must not take place in less than 1 hr. or in more than 10 hr. in order for the cement to pass the test. The other pat is kept in the moisture box for 24 hr., at the end of which time it is placed in a bucket of water. This is then heated and allowed to boil for 4 hr., at the end of which time the pat is allowed to cool slowly and in order to pass the test must show no signs of checking or cracking.

It will be noted that one pat can be used for both of the tests. However, less than ½ lb. of cement should not be used, as any smaller quantity is difficult to handle. A larger quantity than this can be used, if found convenient, and the excess thrown away.

This boil test is one of those used by the chemists and is called the constancy-of-volume test. A cement may pass all the other tests and when used make a fine, firm piece of concrete and still in a number of years begin to disintegrate. It is to determine this quality of the cement that this test is employed. Most of the standard brands of portland cement of today will pass the other tests. Some manufacturers, however, in order to make a cement of great strength mix in an excess of free lime. This adds strength to the cement, but when this class of material is used, the concrete is likely to disintegrate and crumble away after a few years. This variety of cement will not pass the boil test.

In somewhat over 200 samples which I have tested in the last year none have failed to pass the other tests, with one exception, which was too fast in setting. Sixteen samples failed to pass the boil test, however, and were rejected.

A cement which fails to pass this boil test may after aging for 30 days pass it and can then be accepted. A fresh sample must be taken for this test. I believe,

---

*378 Twelfth Ave., Columbus, Ohio.

however, that the time for aging is before the cement leaves the factory, and have consequently always rejected this cement immediately. The purchaser is paying for a finished product and should not be expected to store and age a material when this is one of the processes of manufacture.

It will be seen that the only apparatus required in applying these tests consists of several pieces of glass and a bucket, together with some method of applying heat thereto. A glass cutter is convenient with which to cut the small pieces of glass used for the pats, as is also a small pointing trowel with which to work the material on the glasses. The outfit costs less than a dollar.

I might add in closing that I know of some railroad companies that depend almost entirely on this boil test. I also know of a bridge built over the Ohio River, all of the cement used on which was tested in this manner in the engineer's room at the hotel. It is advisable, however, when building any structure involving the outlay of a considerable amount of money that the cement be tested by one who is properly equipped and is familiar with testing this class of material.

Extracts from a Superintendent's Diary

Constantly and in various ways we learn that the outside world has a very poor opinion of our people and their standing in society.

Sometimes it is by word of mouth from strangers passing through, sometimes through letters received in protest of things we have done or are about to do, as reported to the world at large by some metropolitan paper, or again through the actions of people who are called into our camp unexpectedly by business or social necessity.

During the past week the tragic death of one of our citizens brought into our camp a very estimable lady from a distant city, and through her coming we were made to realize how prejudice against mining folk may affect human happiness.

Most of the circumstances in this particular case have only become known to us during the week, notwithstanding the fact that Arnold Cross and his family had lived in our camp for several years. Arnold Cross is the young man who was buried this week, and the lady that came here as a stranger, and by her coming brought out all of the facts, was Arnold's mother.

Ten years ago Arnold Cross, then a young man just out of college, accepted a position as school teacher in a Pennsylvania mining-camp village. Two years later he fell in love with a miner's daughter and married her.

Arnold's mother was a widow of some means living in Boston. She had never visited a mining camp, but with the prejudice so characteristic of city folk she assumed that her son had brought disgrace upon the family name—a name which had been prominent in Massachusetts history for several generations—and true to the traditions of her forefathers she disinherited the son.

In a few years Arnold tired of teaching and decided to learn the mining business.

His father-in-law, a thrifty coal digger, gave him the opportunity by taking him in as a "buddy." Within a few months his earnings were larger than the salary he had received as a teacher, and he never regretted the step.

After getting practical experience, he made up his mind to prepare himself for the mine foreman's examination, and at the next session of the examining board he passed with a high mark; but the length of his experience would not permit him to obtain a certificate, so he came to our state, where the requirements were not so severe.

He accepted a position at our camp as assistant foreman and was in line for promotion to a foreman's job with the next vacancy.

Marrying a miner's daughter was bad enough from his mother's standpoint, but accepting work in the mines was past understanding, and from the time he went to work in the mines his mother even refused to correspond with him.

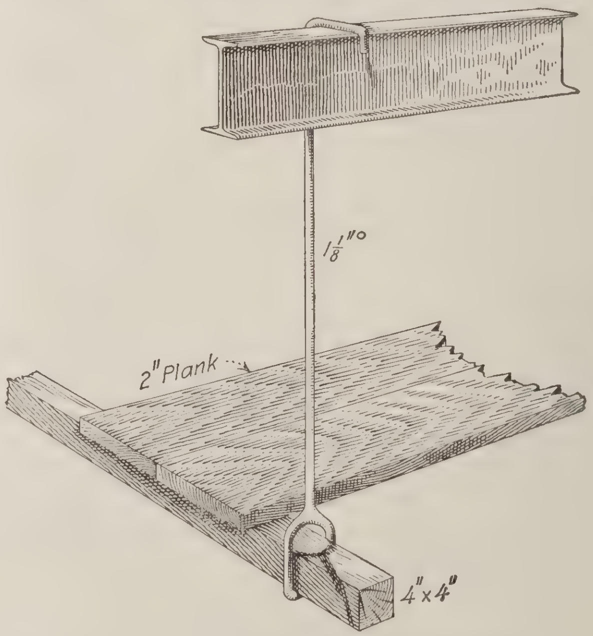
One of those unaccountable explosions of a small gas pocket where gas was never expected snuffed out Arnold's life last week, and his mother's arrival in our camp was in answer to a telegram announcing his death.

We have had the unhappy lady as a guest at our house during her entire visit, and it fell to my lot to make her realize that her son had followed an honorable occupation, had acquitted himself with credit in that occupation and left behind a wife loved and respected by everyone in our village and of whom any family might well be proud.

That I did my work well is evidenced by the fact that Arnold's wife is to go to Boston with the mother to make her home there for an indefinite period.

Staging Hangers for Riveters on Structural Work

Slinging a staging for riveters on structural ironwork, says *The Engineering and Mining Journal,* is too often done with ropes, which for this purpose are both unsatisfactory and unsafe. A cheap and convenient hanger, shown in the accompanying sketch, is made of 1⅛-in. round iron, with a large eye at the lower end and a hook at the upper end to hook over the I-beams or other structural members. Through the eye is inserted a 4x4 timber on top of which 2-in. planks are laid. The cost of these hangers is small, they are light and can be handled easily, and they are not liable to destruction.



STAGING FOR STRUCTURAL IRONWORKERS

Some Technical Aspects of the New York Specifications

By Reginald Trautschold*

SYNOPSIS—An analysis of the causes leading up to the reason for the adoption of the more rigid specifications. The requirements of the new proposals can only result in higher bids to protect against penalties. Methods of sampling and analysis are open to criticism.

The revised specifications for the purchase of coal by the various departments of New York City are truly remarkable in their impracticability, their radicalism and their injustice to the dealers, and this in spite of the fact that they are the result of months of work on the part of a special committee representing the largest coal-using departments, assisted by the Bureau of Standards of the Board of Estimate and Apportionment. They were taken up because the rather drastic specifications adopted some four years ago failed to satisfactorily protect the city's interest.

The city discovered that under the old specifications it was paying more for coal and receiving consignments of a poorer quality than certain individuals and private corporations. A more careful investigation by the committee might have traced the trouble to failure to secure widely competitive bidding between reputable dealers owing to the severity of the old specifications. Instead of which, though the committee rightfully came to the conclusion that the fault lay with the old specifications, they proceeded to make these still more exacting, apparently hoping to lower the cost of coal by demanding that it meet much harder conditions.

Price Governed by Demand

The price of coal, like that of any other commodity, is governed by the law of supply and demand, and if the city has paid higher prices and received poorer coal than others, it has been because this incontrovertible law has been further complicated by the insistence of the right of selection. Coal dealers are not necessarily less honest than other merchants and if not burdened by too many conditions will serve the city as well as they do other customers. The value of the coal they have for sale is fixed by the general demand, and if this is interfered with by the insistence of the right of selection and condemnation, it is only to be expected that a higher price will be demanded or a poorer quality supplied.

To return to a consideration of the new specifications, the most glaring handicaps have been imposed on the steam sizes of anthracite, such coals being those purchased most extensively by the city.

The specifications for broken down to pea have not been altered so much as to cause any very great injustice. It is in connection with the smaller washery sizes of anthracite that the drastic changes occur. In the first place, the heating and ash-contents requirements of the buckwheats have been reversed—No. 3 being ranked first, then No. 2, and No. 1, which has always been considered one of the best anthracite steam coals, listed last, with requirements similar to those for buckwheat No. 2 under the new specifications.[1] The heating value and the ash contents required of buckwheat No. 3 are the same as those for pea coal, while the specifications for buckwheat No. 1 in respect to ash, volatile, sulphur and heating value remain the same as under the old specifications, the only change being an increase of 1 per cent. in the allowable moisture.

How the arbitrary decision of the city that the buckwheat No. 3 should rank as high as pea in heating value and as low in ash content, while buckwheat No. 1 may possess nearly 1⅔ per cent. less heating value and contain 12½ per cent. more ash can alter the logical ranking of the buckwheats is hard to see. Such arrangement is much to be desired, and if it can be brought about by the new specifications, the committee will receive the unqualified indorsement of all coal men.

Penalties and Bonuses

Coal failing to meet the new specifications is penalized most severely; deductions in the gross amount of coal paid for are made both for ash content greater than the very low allowable percentages permitted and for any decrease in heating value below the specified requirements. The presence of ash being directly measured by a decrease in heating value, it is actually penalized twice—once for its presence and again for its effect upon the value of the fuel.

The penalty for ash in excess of that allowed under the specifications is a reduction of 1 per cent. in the gross weight of the coal for each 1-per cent. increase in ash up to a maximum of 2 per cent. more than allowed under the specifications. Any further increase is taxed 2 per cent. for each additional 1 per cent. of ash.

Failure of the coal to possess the heating value demanded is penalized by a reduction of 1 per cent. in the gross weight of coal for each 100 B.t.u. for the first 300 B.t.u.'s deficiency, after which the penalty is increased to 2 per cent. for each additional 100 B.t.u.

A lamentably weak attempt to equalize the extremely severe penalties is made in the way of bonuses. These are proposed for deliveries of coal superior to that demanded, but are simply to be remissions of penalties imposed on other deliveries under the same contract at the same unit price. Such remissions are to be credited at the rate of 1 per cent. for each 100 B.t.u. in excess of the number called for in the specifications. No bonus is offered for a reduction in the allowable ash content, although any excess carries a double penalty, nor are the remissions to be credited against any penalties imposed at the rate of 2 per cent.

The unfairness of the penalties and the inequity of the remissions may be better shown by means of an assumed transaction. For instance, a consignment of buckwheat

---

*39 Charles St., New York City.

[1] For tables showing required analysis, see Vol. 8, p. 132.

No. 3 might be required. According to the new specifications, such a coal should show 12,400 B.t.u. per lb. and contain not more than 16 per cent. ash. It may safely be assumed that such coal is of a high grade that can be obtained at least occasionally. It is not at all unlikely that the analysis of the sample taken from a delivery would show the presence of 19 per cent. ash, which is the allowable percentage of ash for this grade coal under the old specifications but an excess of 3 per cent. under the new regulations and subject to a total penalty tax of 4 per cent.—1 per cent. for each of the two first 1-per cent. excesses and 2 per cent. for the third 1-per cent. excess. Assuming that the analysis was really typical of the mass of coal furnished on this specific delivery—a condition that would be problematic, but which should be admitted for the sake of the argument—the presence of 3 per cent. excess ash would markedly reduce the heating value of the coal.

ASH REDUCES HEATING VALUE

It is a fact well-substantiated by practice and confirmed by numerous authentic tests that each 1 per cent. of ash contained in coal of this grade reduces its heating value by $1\frac{1}{4}$ or $1\frac{1}{3}$ per cent. If buckwheat No. 3 containing 16 per cent. of ash possesses a heating value of 12,400 B.t.u. per lb., the presence of 19 per cent. ash would reduce the heating value approximately 500 B.t.u., other constituents of the coal remaining about the same and assuming the greater loss owing to the presence of the excess ash ($12{,}400 \times 0.01\frac{1}{3} \times 3 = 496$ B.t.u.). A lack of 500 B.t.u. per lb. would entail a penalty of 1 per cent. for each 100 of the first 300 B.t.u. and 2 per cent. for each of the other 100 B.t.u., making a total penalty owing to the presence of excess ash of 7 per cent.

The total penalty imposed on the delivery would then be 11 per cent.—4 per cent. for the presence of the excess ash and 7 per cent. for its effect. A remission of 5 per cent. would be all that would be possible for the dealer to secure, no matter how superior might be the coal delivered on the balance of the consignment at the same unit price, for the 2-per cent. penalties would not be subject to any remissions.

Competition in the sale of coal has driven the ordinarily obtainable profit down to about 10c. a ton. With buckwheat No. 3 commanding a price of \$3 per ton delivered, this represents an obtainable profit for the dealer, should his coal meet the new city specifications, of $3\frac{1}{3}$ per cent. A large portion of the coal delivered by the dealer on his consignment having perforce to bear an unavoidable penalty of 6 per cent., owing to the presence of a little excess ash for which he is not allowed to make recompense by other deliveries of higher-grade coal, it is difficult to see how he can avoid adding at least 10 or 15c. to the price he charges less-exacting customers for the same grade coal.

Such a transaction would not be at all unusual, no exaggerations nor improbable assumptions having been made; so it is extremely difficult to see how New York City or any other customer can benefit by the adoption of any such impractical specifications. Only one result can follow their enforcement, and that is a very decided falling off in the number of competitive bids received and a marked increase in the unit price that the city will be compelled to pay for its coal.

Aggravating still further the injustice imposed by the heavy penalties is the strong probability that the taking of samples for analysis may not be fair and the results shown not typical of the mass of coal. There has been no uniform system or method of sampling coals at the Central Testing Laboratory, or for that matter anywhere else, and remarkably apparent variations in the quality of the coal in the same consignment have resulted. There have been instances of reported variations as great as 1,000 B.t.u. in the heating value of coal in two deliveries made to different parts of the city, both of which were made from the same shipment.

Scientific methods of purchasing commodities have done much to better market conditions and to protect the purchaser from unscrupulous merchants, but so-called "scientific buying" can be overdone. Any such specifications as those proposed to govern the future coal purchases of New York City, if they are supposed to be drawn up along scientific lines, promise nothing but dissatisfaction and a heavy unnecessary expense to the city. If New York City will rely more on the common honesty of the coal dealers, use more common-sense and less misapplied scientific effort, and accept the incontrovertible law of supply and demand, unburdened by any reservations, it will not only fare better, but go farther.

Ballads of a Coal Miner--VIII

Written expressly for Coal Age · BY BERTON BRALEY

I AIN'T *such a wise guy at dopin' things out,*
But one fact I'm reas'nably certain about—
We're wasteful in minin', there isn't a doubt.

We waste at the breaker an' waste in the sump,
We waste in the entry an' waste at the pump,
We waste on the cages an' waste on the dump.

We use too much powder, yet leave too much coal
That's wasted forever—no good to a soul;
We leave it down deep—an' we fill in the hole.

With hurry an' haste as the motive that drives,
We're wasteful of labor an' wasteful of lives,
An' wasteful of tears of the children an' wives.

If only we'd see it, if only we'd turn
An' look ourselves over, in time we might learn
To mine with less waste an' more carbon to burn.

For there ain't no use talkin', we waste at the sump,
In tipple an' breaker an' down at the pump;
We waste in the tunnels, the shaft an' the dump.

The Labor Situation

SYNOPSIS—Attempts are being made to unionize Colver, Cambria County, Penn. In Ohio the coal operators are trying to divorce the railroads from the mines. West Virginia operators defend their position. Colorado Fuel miners are well disposed toward the Rockefeller agreement.

On Oct. 14 the 600 men of the Maryd colliery of the J. S. Wentz Coal Co. went on strike because the company refused to recognize their grievance committee. In the Maryd mine gas has compelled the introduction of safety lamps in the middle district gangway, and the miners believe they should be compensated by an increase in yardage for the greater difficulty under which they perform their work. The strike was declared at an end on Oct. 22. The Brockton, Tuscarora and Maryd locals were all interested, and the first two were not satisfied with the way in which the Maryd local handled the situation. The Tuscarora local was then allowed to represent the men. Arthur Kennedy, the mine superintendent, declared that he would not discuss matters with the committee till the men returned to work, as the agreement required that operation should not be suspended. Ultimately the men agreed to work, as in duty bound, pending a settlement.

JOHN D. ROCKEFELLER, JR., AND SOME CITIZENS OF TRINIDAD, COLO., ABOUT TO VISIT FREDERICK MINE

Rockefeller is the man in the center of the group, with crossed legs and arms. E. H. Weitzel, the general manager of the Colorado Fuel and Iron Co., is the individual with the smiling countenance with his back to the window

An Attempt to Unionize a Cambria County Mine

Colver is a large mining town not far from Ebensburg, the county seat of Cambria County. A fine grade of low-volatile coal suited for naval use is produced, and the mines have shown much activity during the recent slack period, owing to the exceptional quality of the coal marketed. Apparently an attempt has been made recently to unionize the mines which have hitherto been nonunion.

Charles O'Neil, the vice-president of district No. 2, which includes all central Pennsylvania, declares that he and other officials of the union, including William Welsh, went to Colver, and while at dinner in the Colver Hotel saw certain state troopers. He states that the troopers were called on one side by the Ebensburg Coal Co. officials and later left the hotel, as if to give the mine guards a free hand.

O'Neil declares that on withdrawing to the hotel office the blinds were drawn and the doors were locked, and several mine guards having been called in, the union men received a severe mauling. Later O'Neil and Welsh, according to the former, were put in an automobile, escorted from the town and told that if they ever came back they might not leave in as good a condition as they entered. O'Neil states that some of his teeth were knocked out. The company officials are said to have declared that the union men were asked to leave town, and on being seized by an officer O'Neil resisted.

The relations between the railroads and the coal companies have always had much to do with the labor situation, and especially is this true in Ohio. Consequently it may be excusable here to introduce an account of the litigation between J. S. Jones and two of the main railroads passing through the coal regions of Ohio.

The present owner of the Sunday Creek coal properties, the Sunday Creek Coal Co., of which J. S. Jones is principal owner, is endeavoring to divorce the railroads from the coal companies as a means of removing discrimination. United States Judges Warrington, Denison and Knappen, sitting as a special Federal District Court Oct. 9, presided at another round of the battle-royal between the Sunday Creek Coal Co., the Hocking Valley Ry. Co., the Toledo & Ohio Central Ry. Co. and the attorneys for the Government. The hearing was really a prolongation of previous hearings when the entire case of the railroad control of large coal lands in Ohio and the purchase of the Sunday Creek Coal Co. holdings by J. S. Jones were aired.

Early in the hearing, government attorneys surprised the court by petitioning it to compel the railway companies to dispose of their interests in all coal companies concerned in the former Government suit. This petition was simply asking the court to enforce its former decree providing for a complete divorcement of the railway and coal companies in the State of Ohio. The stocks and bonds, which the Government attorneys would have the railroads in question sell, consist of certain securities of the Ohio Land and Ry. Co., the Buckeye Coal and Ry. Co., the Boston Coal Dock and Wharf Co. and about $190,000 in the stock of the Kanawha & Hocking Coal and Coke Co., all of which is owned by the Hocking Valley Ry. Co.

The petition also asked that the Toledo & Ohio Central Ry. Co. be ordered to dispose of its stock in the Imperial Coal Co., the National Coal Co. and all interest in certain coal properties now leased by the Sunday Creek Coal Co. Counsel for the railroad claimed that the National Coal Co. went out of existence in 1912 and that its holdings were taken over by the Imperial Coal Co. He also said that, at the same time, the Imperial Coal Co. reduced its authorized capitalization from $300,000 to $100,000. The attorney, however, admitted that there were certain coal properties owned by the Toledo & Ohio Central Ry. which are under lease to the Sunday Creek Coal Co.

The court also considered a modified contract of sale filed by the Hocking Valley Ry. Co. providing for the disposition of certain lands in Ohio to E. M. Poston. The lands in question are leased to the Sunday Creek Coal Co. The former contract submitted for approval by the court was modified to the extent of having all of the old bonds of the Ohio Land and Ry. Co. and the Buckeye Land and Ry. Co. canceled and new bonds issued in their stead.

This proposition was made providing that J. S. Jones, of the Sunday Creek Coal Co., would enter into a new lease for the mining of a minimum of 500,000 tons yearly at a royalty of 8c. per ton. The railroad company contends that at present no minimum is fixed in the lease and that Mr. Jones is in a position to destroy the value of the coal lands to the stockholders and the bondholders. It is also claimed that the Sunday Creek Coal Co. is not mining the coal in the proper manner. These allegations are followed by a request that the lease to the Sunday Creek Coal Co. be canceled by the court.

ARDINE DENNISON, MINERS' REPRESENTATIVE; W. L. MACKENZIE KING AND JOHN D. ROCKEFELLER, JR.

West Virginia Fears Freight Increase

West Virginia seems to be a unit in demanding that coal freights shall not be raised. The West Virginia operators feel that many of their advantages which the Ohio operators emphasize in print are offset by many drawbacks. They allege that the longer hours and lower pay of their day hands are balanced by the low efficiency of mountaineer labor. The native workmen of the Appalachian chain eat little and are able to do little, and such food as they do eat is of the least nourishing kind. The domestic science classes in various parts of the state are just as much a reflection of that state of affairs as they are of the practical philanthropy of the operators; for the work was really made necessary by the manner of life of the men. The low tonnages of the West Virginia mines have been similarly credited to the inefficiency of the day hands.

When confronted with the greater output of the miners per man, the operators answer that the coal is far thicker and far easier to dig in West Virginia than in Pennsylvania and that the foreigners, who are better than the mountaineers, are mostly working at the room face and so keep up the efficiency of contract work even though that of day work falls to a deplorable level. Besides it is stated that the tonnage per man in western Pennsylvania is higher than is recorded, because the return, while supposed to be based on the coal produced, is really usually only a record of the coal for which the miners receive pay. Because in the Pittsburgh region the miners are paid only for lump coal passing over a 1¼-in. screen, which is the scale agreement, there should be a large addition to the output of machine coal as recorded if the actual coal produced and shipped is to be obtained. This perhaps would add 33 per cent. to the machine coal and not a little to the hand-picked material.

Consequently the talk of greater efficiency per man is thought to be fallacious. The production per miner per working day in West Virginia in 1912, as given on page 814 of Vol. 7, was 6.84 tons. The same figure for Pennsylvania bituminous was 5.61. West Virginia's recorded output per miner is 22 per cent., therefore higher than Pennsylvania. According to some people, this can be largely accounted for by the difference between the coal actually mined and that which is credited to the miner in Pennsylvania. It would be interesting also to know if in West Virginia the operators are basing their recorded outputs on railroad shipment weights or on the accredited weights of the cars dumped where the coal is not weighed on the tipple.

The miners in Las Animas and Huerfano Counties in Colorado, where much of the plant destroying took place during the great mine strike, seem to be convinced that the agreement offered by the Colorado Fuel and Iron Co. would assure them of desirable working conditions. Tabasco, which is only 3 mi. as the crow flies from the unfortunate town of Ludlow, voted 138 against 25 for the agreement. Berwind, which is 4 mi. from the same junction point, voted 140 against 9 in favor of the Rockefeller-King instrument. Other camps somewhat more remote voted as follows: Rouse, 139 for, 6 against; Lester, 97 for, 9 against; Cameron, 128 for, 0 against; Ideal, 88 for, 0 against; Walsen and Robinson, 276 for, 35 against; Primero, 186 for, 22 against; Morley, 142 for, 28 against; Frederick, 190 for, 18 against; Segundo, 125 for, 15 against; Sopris, 221 for, 63 against; and Gulch, 60 for, 0 against.

Attitude of Union Toward the Agreement

The union, speaking through John R. Lawson, international board member, does not of course approve of this agreement, principally because it leaves the union out. The miners, he says, want not charity but justice, which apparently means that, according to Lawson, they seek not so much fair working conditions as an opportunity to rake up imaginary grievances. If they have fair treatment they surely need not seek to keep in operation those elaborate state-wide and nation-wide organizations by which protest is cultivated when no real grievance is apparent.

Under the plan any real difficulty has ample chance for settlement. The mechanism for protest when perfected invariably leads to protest whether there are any wrongs to be righted or not. This mechanism is not allowed full development in the agreement; for the employees, while they have their private meetings at the camps, meet the employees of other camps only in joint committees with company men.

Robert H. Harlin, Percy Tetlow and James F. Morgan, representing the international executive board of the United Mine Workers, in a statement issued Oct. 2 called attention to the fact that the plan fails to provide for meetings of miners except locally, and all meetings except those which are local are to be attended by an equal number of company officials, "thus eliminating the danger of the collective action that might result if men from several mines met together, free from company influence."

John R. Lawson Is Admitted to $35,000 Bail

On Oct. 7 John R. Lawson was admitted to bail in the sum of $35,000, and this security being promptly furnished by the union he was set at liberty. Apparently the cases against the strikers will be pushed forward to trial. Governor Carlson urges that while lenience might at present restore peace in Colorado, it would only foster trouble in the future by creating the impression that by making a sufficient disturbance the friends of lawbreakers can always induce the withdrawal of prosecutions.

The trial of Nicholas Dormas, a Greek coal miner charged with the deliberate murder by shooting of William Dick during the great mine strike, was commenced Oct. 16. Mr. Dick was conveying the pay of his men by automobile to his Oakview mine west of La Veta when the crime was committed. Owing to the precautions made by Mr. Dick the criminal failed to find the cash secreted in the machine, but though he did not profit by his venture he was successful in escaping to Utah, where, however, he was apprehended later. His accomplice, Vardis Marinos, another Greek, is under indictment for the same offense and his trial will follow.

Editorials

The Loss of Wealth Resulting from Idle Time

It is important that we should lay seriously to heart the wealth lost to the nation by idle time. The hours we deliberately devote to pleasure have their helpfulness, but the time during which we are forced to be idle rests neither body nor mind. At such times we simply drift along without purpose and establish bad habits which leave us permanently weaker.

The yearly average of days of activity in the mines of the United States from 1908 to 1914 was 217. Thus the mining plants averaged only about 72 per cent. of full time. In the year 1914 the number of working days, according to United States Geological Survey report, was only 207 for all coal mines throughout the country.

Unfortunately even this time is not by any means evenly distributed. Some mines are idle a large percentage of the year, while others work with regularity. A few mines in agricultural states work mostly in the winter, and in the summer the men must find farming jobs to keep them busy, though it is doubtful whether many of them do. A miner is not always willing to work under a hot sun. Arkansas and Oklahoma in 1913, for instance, only worked 174 days, or barely 55.5 per cent. of the possible working time.

Perhaps under no circumstances will it be possible to keep coal mining at an even pace throughout the year, but surely it will be possible in the future to do better than in the season just past. Such depression as occurred last year would be helped by a combination embracing all the mine operators, but the conditions of unemployment were nation-wide, and something broader than a combination of mine owners would be necessary as a stabilizer. The whole nation must get together to produce a stability in business which will make steady work in coal mines and in every other form of activity.

It will be necessary for our citizens to learn that a wrong too rapidly righted introduces another wrong, just as an automobile pursuing the wrong path if too suddenly steered into the right direction may keel over. Such changes of helm as we have had in past years would make the stanchest of craft travel heavily.

There should be no violent modifications in tariffs, whether on railroads or at ports. Every readjustment upsets business. Perhaps some industries do need to be readjusted, but the work should be done slowly so that labor can move to a more suitable location; so that capital rather than being withdrawn may not be further expended in those industries that are based on unfair economic conditions; and so that those who have made bona-fide loans to certain industries based on conditions found to exist may not, when the conditions are being corrected, lose the money they have put out at interest. The 15c. increase in railroad tariffs schemed for the coal business in West Virginia should be divided over at least three years, and the reduction of the anthracite tariff, recently ordered by the Interstate Commerce Commission, should have been spread over an even longer period.

If an industry is based on a certain tariff, national or industrial of any sort, any change in it should be gradual, so that business in general should not feel the jar. There is no other country where business travels so by jerks or where the fluctuations of industry are so great. For a time our commercial activities sail along merrily. The rich man makes a fair profit. Someone thinks it excessive, and it is cut down. Immediately the rich man ceases to have ready money, and he cannot make improvements, build railways or factories, and as an equally immediate result that portion of business which depends on the new work started by such rich men suffers and is idle.

The coal business depends on the railroad, the brick and like industries. Granted a stagnation owing to the lack of earnings to create new capital; granted a lack of desire to invest because opportunities are suddenly far less appealing in the forms of investment which each capitalist understands or because the profit is seen to be lower than before or less than what is confidently expected in the future; granted a fear to invest because of all the dire things the fear of other failures creates—then all that part of business based on progress and not on diurnal needs will utterly disappear.

That is what has happened to the coal business in the past year. Let us have reformation wherever it is needed, but not revolution. There is need for a steady hand upon the wheel, that will guide us safely and not spill us over in the road. Perhaps we may steer toward the wrong town, but if we veer slowly rather than turn abruptly, we shall certainly not upset by the way.

The coal business is suffering from the foolish restrictions placed on other industries. But the coal men are themselves partly to blame. The operators were the leading baiters of railroads about car shortage and were among the first to leave the railroads with empty cars on their hands in the stagnation that followed. The coal shipper had no more right to insist on the railroad having cars for all possible shipments than the railroad would have a right to demand at any moment the delivery of an unreasonable amount of coal. Neither a railroad nor a producing company can afford to use its capital intermittently so as to meet all kinds of unreasonable demands of merely temporary duration.

But unreasonable as they are, we make all kinds of suddenly exercised restrictions; we lay burdens on commerce which, all unexpecting, commerce cannot meet; and then we wonder why in 1914 our coal trade was not 66 per cent. efficient.

If that 33 per cent. of loss could only be salted down, how wealthy we would be! If that time, instead of being devoted to loafing around stores and bar-rooms and making home unpleasant, had been conserved for the building of homes, the making of railroads and the erection of factories, we might well be a richer and happier people.

But we go on destroying industry by our coquettish moods. We question how and what we should build, but we recognize that first the site must be cleared. So we tear down and leave the building for a later day. In the future we shall imitate the gardener who when he would bend a tree or a limb does it gradually week by week so that he does not strain the limb too severely and break rather than bend it.

Company and Other Stores

In making a general summary of the bituminous coal census in 1909, the United States Bureau of the Census says:

> In the United States as a whole the total expenses reported for mines without coke manufacture amounted in 1909 to $301,451,896 and the total value of products to $315,894,935, showing a difference of only $14,443,039, or about 5c. per ton of coal produced. In Arkansas, Iowa, Kentucky, Oklahoma, Oregon, Tennessee, Virginia and West Virginia the expenses reported exceeded the value of products. For mines with coke manufacture . . . in Kentucky, Tennessee, Virginia and Washington the expenses reported . . . exceeded the value of products.
>
> These data cannot be taken as showing accurately the amount of profit or loss in the coal-mining industry of the several states, but they do seem to indicate that in many states the industry obtains only a very low rate of profit, if any. It should also be noted that many operators make a considerable profit by renting houses and selling merchandise to their employees. The Bureau of the Census corresponded with many operators whose returns showed an excess of expenses over the value of products, and not a few of them stated that while there was a loss in their coal-mining business proper this was more than counterbalanced by profits from selling merchandise and renting houses.

The remarks about stores and houses may appear a damaging indictment against the coal operator, but surely because the mine owner has lost money in coal production is no reason why he should lose it in all his other ventures, allied or unallied. The company store really stands the most favorable comparison with the city store, and the house rents at the mine will not suffer when contrasted with those of the country village. Of course city rents for obvious reasons are considerably higher than those in the country or at the mine.

Merchandizing in the cities has produced some of the largest of fortunes, and these were usually made in a single generation. It is only necessary to mention such men as Wanamaker, Altman, Straus, Field and Stewart to show that the profits of merchandizing in the open market are quite frequently extremely large, and it is questionable if they are nearly as great in mine stores.

In large towns the operators' stores have to meet competition of the fiercest kind, and they frequently succeed so well in doing it that they take away the bulk of the business from the local merchants, owing to the fact that they have a large trade absolutely secured from bad debts and of a volume which can be relied on. In the little mine villages the difficulty in obtaining men makes the operators chary about asking high prices.

The profits on store sales need not be high to return a large income. Almost the whole wage of the miner forms the basis for that profit. The larger part of it is spent at the stores and for house rent, and the income from the sales and rents might justifiably be nearly 75 per cent. of the profit which should be, but is not, made by mining coal.

Why should an operator be prevented from profiting from 42 per cent. of his aggregate business in such a degree as to make up for what he loses on the other 58 per cent., so long as his profit on the smaller part of his business is not unreasonable? In justice to the United States Bureau of the Census it must be conceded it does not suggest any such conclusion, but some of the critics of the coal business having taken away the coat of the operator would take away his cloak also.

Horse Sense vs. a Technicality

Of recent years some of the constructions placed upon workmen's compensation acts by the courts are "fearfully and wonderfully made." Damage suits to obtain compensation for injuries sustained in mining accidents have often resulted in the award of large sums to the person injured, purely and solely because the compensation law removes the common-law defenses of "contributory negligence" and the like. Much injustice has thus often been suffered by the operator or mining company.

A notable exception to this general rule has recently come to light in West Virginia. It appears that a mine employee removed from a drill hole a stick of dynamite with a lighted fuse attached and was "injured" in the explosion which followed. This workman brought suit for damages against his employer, alleging in substance that he had not been warned of the danger of intimate physical association with dynamite about to explode.

Strange as it may seem, this man won his suit in the lower court and secured a verdict for damages. Unfortunately for him, however, the mining company saw fit to appeal the case. The supréme court reversed the decision of the lower tribunal, holding that while the compensation act was valid in denying to employers under certain circumstances the common-law defenses of the assumption of risk and contributory negligence, the failure to warn a man of mature years and in full possession of his normal reasoning faculties of the danger of withdrawing from a drill hole a stick of dynamite attached to a lighted fuse did not constitute negligence on the part of the employer.

That the man was injured by the explosion there was no question; that there was no reasonable excuse for such an injury appeared equally obvious. In this day and age every adult knows that dynamite is explosive and that its neighborhood when it is on the verge of detonation is no place in which to tarry. No employer should be taken to task for failure to warn a man of a danger of which he and every other normal human is fully cognizant. This is a common-sense decision, and it is to be hoped that we may have more such in the future.

A Soft Spot in the New England Market

The New England coal trade inland from Boston, Portsmouth, etc., has shown some interesting developments during the week. Two or three of the distributors have been in lively competition for 1916 contracts, and a flat price has been named in some instances.

If current rumors are verified, contracts have been closed at prices down to $3.50 f.o.b. Boston for a term lasting until Apr. 1, 1917, and this is not a favorable prospect from the operators' standpoint. It will probably mean that $2.85 f.o.b. Hampton Roads is still too high a basis to be consistently maintained. The old cry of "too many agencies" may again be raised.

Intercompany First-Aid Meet in Somerset County

SYNOPSIS—In Somerset County an important first-aid meet was held by the Y. M. C. A. and the mine operators, with the aid of the state mine inspector. A mining institute meeting preceded the contest.

The Third Annual First-Aid Meet of Somerset County was held Sept. 4 in Boswell, Penn. This meet was promoted by the mine operators, the Pennsylvania State Y. M. C. A., State Mine Inspector F. W. Cunningham and the United States Bureau of Mines. George B. Landis, of the state Y. M. C. A., was the leading spirit in the promotion of the contest.

A distressing explosion of gas in the Orenda mine at Boswell during the previous week emphasized the need for first-aid work at every mine. Of the 19 killed in that explosion, three were members of first-aid teams in Boswell. All the members of the team who were not injured rendered most commendable aid to the wounded and won unstinted praise from the physicians and hospital attendants.

Through the last winter several teams met faithfully for first-aid training. Five of them competed in a local contest on the Fourth of July. During the two months preceding the meet, W. J. German, C. O. Roberts and Jesse Hensen, of the United States Bureau of Mines, gave much time to the training of the teams, and for two weeks the mine-rescue motor truck toured the field, arousing much interest in first aid.

MINING INSTITUTE MEETING IN MORNING

On the morning of the contest 28 teams, each containing six men, reported. They represented nine companies from 23 mining towns. At 10 a.m., prior to the contest, a mining institute was held, and a crowded house listened to an address by Austin King, chief inspector of the H. C. Frick Coke Co., and H. D. Mason, Jr., assistant engineer of the United States Bureau of Mines. Three thousand feet of moving-picture film was shown, illustrating safety, first-aid and improved methods of mining.

After noon the teams paraded to the ball grounds, accompanied by two bands. There were 2,500 interested spectators. The 28 teams, comprising in all 168 men, were in line. A space of 10 ft. was given to each team, position being assigned by lot. At the sound of the gong the patient advanced to his place, and at the second signal those who were to administer first aid followed him and proceeded to work.

The first event was for one man only. The problem was: Victim has four fingers severely crushed; bleeding wound in the hand. Treat and carry by shoulder lift. T. R. Downie, of the Consolidation Coal Co.'s plant at Acosta, made a perfect score.

The two-man event was: A simple fracture of the right forearm and a scalp wound on the back of the head, but no bleeding. Treat and carry the patient 30 ft. without using a litter. The contest resulted in five teams making the same score, and so the following problem was submitted to them: Patient found unconscious, lying with his abdomen across an electric wire and with a simple fracture of the right forearm. Rescue and treat the case, providing artificial respiration for two minutes.

But still three teams tied for first place, and the following problem was submitted: A victim is burned by steam on face, neck, ears and both hands. Treat and carry the patient 20 ft. without a stretcher. As a result the Jenner-Quemahoning Coal Co.'s team No. 2, of Jerome, Penn., obtained first place, and the Orenda No. 1 team, of the Merchants Coal Co., was second. Third place fell to Jenner-Quemahoning No. 1, also of Jerome, Penn.

The full-team events consisted in alleviating the condition of the following victims: 1. A man has been run over by a motor and his right arm has been cut off close to the shoulder, causing profuse bleeding and breaking several ribs on his right side. Treat and carry on a stretcher. 2. A man is found unconscious and lying on his back across a live electric wire. Rescue him and give him artificial respiration for one minute. Then treat the burns on the back and right upper arm. Carry 30 ft. on any improvised stretcher except one made of poles and coats. 3. A man has a broken back, with a simple fracture of the right forearm. Prepare for transportation.

The averages of the scores made in these three events showed four teams with 99.3 each. The teams broke the tie by working on the following problem: A man is found under a fall of coal, having sustained a punctured wound of the abdomen, a broken rib on the left side and a cut on the right side of the face from which the blood is coming in spurts. Treat the case, three men carrying the patient 20 ft. in a passage so narrow that a stretcher cannot be used. As a result Orenda team No. 3, of Boswell, received 100; Brothers Valley Coal Co. team, Pen Mar No. 3, of Macdonaldton, had 98; the Consolidation Coal Co. team, of Acosta, 97; and the Somerset Mining Co., team, of Hooversville, 95.

BOTH LAY AND MEDICAL MEN AS JUDGES

The events were hotly contested, and the judges marked closely. On all ties there were three judges to each team. The judges were: Drs. E. H. Lowe, L. M. Gurley, of Johnstown; J. W. Hawes, of Windber; C. C. Custer, of Johnstown; C. B. Korns, of Sipesville; H. Hertzler, of Jenners, and S. J. H. Lowther, of Somerset. Other judges were H. D. Mason, Jr., D. Harrington and C. O. Roberts, United States Bureau of Mines, of Pittsburgh; O. J. Shank, of Windber; George A. Deike, Mine Safety Appliance Co., of Pittsburgh, and Edmund Williams, of the Cambria Steel Co., of Johnstown.

The judges were selected by the representative of the American Red Cross in Somerset County, Dr. M. A. MacIntyre, of Boswell. The judging of first-aid meets by other than medical or surgical practitioners is condemned by the officials of the American Red Cross, and the introduction of expert first-aid men to assist the doctors has been made a subject of protest.

The Du Pont cup for winners in the team events was won by Orenda team No. 3, Frank Swope, captain; Aaron Seasock, George Patton, Herbert Horner, Charles Hurd and Fred Moore, patient. The Boswell First-Aid Association added $10 for the purchase of personal prizes. The American Mine Safety Association and the American Red Cross awarded medals to the winners.

The Brothers Valley team, Pen Mar No. 3, of Macdonaldton, consisting of Robert Forsythe, captain, Robert Purcell, Sam Verchetti, William Albright, Harry De Haven and Lawrence Purcell, received second prize—a Bauer & Black first-aid cabinet and Red Cross certificates.

The third prize was awarded to the Consolidation Coal Co. team of Acosta, which comprised S. F. Shafer, captain, T. R. Downie, Robert Grove, William Crosby, R. B. Zimmerman and John Byron, Jr.

The average records of the various teams in the three full-team events which preceded the contest were as follows:

Somerset Mining Co., of Hooversville, 99.3; Consolidation Coal Co., of Acosta, 99.3; Merchants Coal Co. No. 3, of Boswell, 99.3; Brothers Valley Coal Co. No. 3, of Macdonaldton, 99.3; Consolidation Coal Co. No. 1, of Jenners, 99; Victor Coal Mining Co., of Holsopple, 98.3; Merchants Coal Co. No. 2, of Boswell, 98.3; Jenner-Quemahoning Coal Co. No. 2, of Jerome, 97.6; Knickerbocker Smokeless Coal Co., of Hooversville, 97.6; Brothers Valley Coal Co. No. 2, of Macdonaldton, 97.3; Merchants Coal Co. No. 4, of Boswell, 97.3; Merchants Coal Co. No. 5, of Boswell, 97.3; Consolidation Coal Co. No. 2, of Meyersdale, 97; Quemahoning Coal Co. No. 4, of Ralphton, 96.3; Consolidation Coal Co. No. 2, of Jenners, 96; Merchants Coal Co. No. 1, of Boswell, 96; Brothers Valley Coal Co. No. 1, of Macdonaldton, 96; Jenner-Quemahoning Coal Co. No. 1, of Jerome, 96; Consolidation Coal Co., shaft 123, of Gray, 95.6; Quemahoning Coal Co. No. 1, of Ralphton, 95; Consolidation Coal Co., of Pine Hill, 94.6; Consolidation Coal Co., of Wilson Creek, 94.6; Consolidation Coal Co. No. 1, of Meyersdale, 94.3; Baker Whiteley Coal Co., of Hooversville, 94; Quemahoning Coal Co. No. 5, of Ralphton, 93.6; Quemahoning Coal Co. No.

2, of Husband, 93; Quemahoning Coal Co. No. 3, of Ralphton, 93; Quemahoning Coal Co. No. 1, of Husband, 93.

The committeemen in charge of the meet were F. W. Cunningham, state mine inspector; Samuel Steinbach, Consolidation Coal Co., Somerset; Richard Maize, Jenner-Quemahoning Coal Co., Jerome; John Gibson, Jr., Merchants Coal Co., Boswell, and Ralph Zimmerman, Quemahoning Coal Co., Ralphton.

⁂

First-Aid Teams at Oliver Plant

At the coal mines of the Oliver & Snyder Steel Co., near Uniontown, excellent first-aid work has been accomplished though but little about it has so far been published.

The illustration herewith shows the participants in this work, both male and female. In the first row is Junior team No. 2, comprising from left to right, Joe English, Clyde Perkins, John William Kegg, John O'Brien, captain, Pat English and Charles O'Brien.

In the second row is Junior team No. 1, comprising from left to right Charles Perry, Edward Tishue, Cecil Dixon, captain, Samuel O'Brien and Frank Phillips.

In the third row is the ladies' No. 5 team, consisting of Stella Rafter, Florence Grim, Daisy Patterson, Isabella Dixon, Mrs. Harry Rafter, Mrs. Arthur Grim, Elsie Dixon and Barbara Patterson, captain.

In the fourth row is No. 1 team, consisting of Fred S. Watts, captain, Charles Grim, Jr., Charles Carnes, J. R. Craft, Claude Lowdermilk and James English. Farther to the right is No. 2 team, consisting of William Henry, Arthur Grim, Charles Gillingham, John Anthony, David Davis, Ernest Sauers and William Davis, captain.

In the fifth row is No. 3 team, consisting of Don McPhail, captain, Frank Yarnosky, Andy Stiner, William Lally, Evan Cramer and Wilbur Griffith. Still farther to the right is No. 4 team, with Thomas Kegg, Lewis Reiver, James B. Hines, John Petrovish, James Hill and Henry Roebuck, captain.

In the back row is Yard Foreman George Dixon, Engineer Charles Hinsey, Manager Ira D. McCowan, Dr. George O. Evans, Instructor Clyde Brehm, Superintendent John H. Lane, Mine Foreman John Curry, Mine Foreman Gomer Lewis, Superintendent of Car Service J. B. Frost and Mine Foreman Holly Wilson.

The mines of the company are located at Oliver, Fayette County, Penn., on the Pennsylvania R.R. and the Baltimore & Ohio R.R. The seam mined is the Pittsburgh bed, which has a treacherous roof, making first-aid work most necessary.

FIRST-AID TEAMS OF THE OLIVER AND SNYDER STEEL CO. AT OLIVER 1, 2 AND 3 AT UNIONTOWN, PENN.

Permissible Explosives Tests

At the invitation of Van. H. Manning, acting director of the United States Bureau of Mines, a number of the prominent manufacturers of permissible explosives used in coal mines met in conference at the Bureau of Mines offices in Washington, June 7, to discuss the tolerances that may be permitted in tests of field samples or manufacturers' samples of permissible explosives.

At the request of Mr. Manning, Dr. Charles E. Munroe, consulting explosives chemist of the Bureau of Mines, presided at the conference and explained its objects. Addressing the manufacturers, he said:

"Today there are 133 different explosives on the permissible list. There have been others admitted to the list and later removed. In all, over 150 explosives have been tested by the various methods and the results carefully recorded by the bureau. It was found that the bureau could not rest content with simply testing the original samples submitted and saying that hereafter that was a permissible explosive provided it was used in the manner described by the bureau. It was felt that in order that the bureau might know that the explosives were of the proper kind, samples should be obtained in the field and that such samples should be tested by the same methods. When this was undertaken, the question came up as to how nearly the tests should conform to the results of the tests made on the original samples because it is well known that it is physically impossible for a man to exactly duplicate results in two tests.

"After a large amount of data had been gathered, a committee was appointed by the director to consider the problem. The committee has been working on the matter for a long time; the data have been tabulated and closely investigated by the members of the committee."

The questions submitted by the committee of the bureau were taken up in detail, and the proposition to which the conference assented was as follows:

In order to define more exactly what is meant by the phrase "similar in all respects" in the definition of a permissible explosive—namely: "An explosive is called a permissible explosive when it is similar in all respects to the sample that passed certain tests by the United States Bureau of Mines and when it is used in accordance with the conditions prescribed by this bureau"—the following tolerances are recommended for field samples or manufacturers' samples of explosives, beyond which such lot of explosives may not vary.

CHEMICAL ANALYSIS

Moisture to be fixed by a sliding scale of from 1½ per cent. at zero to 4 per cent. at 10 per cent. of moisture in original sample, this tolerance being on total percentage of moisture in the explosive.

For other ingredients (or their equivalents) in quantities not exceeding 60 per cent., special rules shall apply. For ingredients in quantities of 60 per cent. or more the tolerance shall be plus or minus 3 per cent., provided that the ingredients of a permissible explosive shall be considered to be those substances reported as found by the Bureau of Mines in the original sample of that explosive submitted for test as to its permissibility, and provided further that an equivalent shall be considered to be a substance which would not materially alter the properties of the explosive and which would produce the same result as the original substance.

As to the products of combustion (determined by Bichel gage test), the volume of poisonous gases from 680 grams of the explosive including its wrapper must be less than 158 liters, except that in case the first test yields 158 liters or more of poisonous gases per 680 grams of the explosive, including its wrapper, the average result of three tests agreeing within 5 per cent. of each other shall be taken, and no explosive shall remain permissible when this average for poisonous gases exceeds the above standard limit.

PHYSICAL TESTS

The rate of detonation (the average of three trials with Mettegang's recorder) must be plus or minus 15 per cent.

The unit deflective charge (the average of three trials with the ballistic pendulum) must be plus or minus 10 per cent.

The grams of wrapper per 100 grams of explosive must be plus or minus 2.0 grams (average of four determinations), provided that the manufacturers shall submit samples of all different sized cartridges, to be considered as part of the original sample, the amount of wrapper to be determined for each size of sample, and provided further that the tolerances as suggested shall be made in comparison with the various diameters as submitted with the original sample.

The apparent specific gravity of cartridge, by sand, must be plus or minus 7.5 per cent. (average of four determinations), provided that actual density shall be determined on cartridges of the same diameter as the standard and provided further that manufacturers shall be required to submit samples of all sizes.

As to gas and dust gallery No. 1, no ignition must be obtained in each of one or more trials. In the retesting of permissible explosives by tests 1, 3 and 4, the charges of the explosives fired will be reduced 10 per cent. in weight from the weights originally used in order to eliminate any likelihood of a failure being due to the natural variations in the conditions of the gallery.

In the pendulum friction test, each explosive must pass a test of ten trials under the same conditions as originally imposed, except that the fall of the wood-fiber shoe will be reduced by 10 per cent. in order to eliminate any likelihood of a failure being due to the natural variations in test conditions.

HOUSES IN THE VILLAGE AT THE FREDERICK MINE OF THE COLORADO FUEL AND IRON CO.

Discussion by Readers

Mine Discipline Imperative

Letter No. 1—I was greatly pleased to see the long editorial entitled "Is Our Conception of Mine Discipline Changing?" *Coal Age,* Oct. 2, p. 552. I believe this is one of the most vital questions connected with coal mining, and its discussion in *Coal Age* will reach more mining men than would be possible by any other means.

In the large majority of cases the underlying cause of mine accidents is found to be someone's disobedience of instructions or violation of the mine laws or regulations. The fault may lie with the superintendent, foreman, assistant foreman, fireboss, miner, driver, trip-runner or even a trapper boy. In the public press the blame is largely laid on the shoulders of the company or some of its officials.

The editorial to which I have referred regrets the decline of the old-time discipline in coal mining, and it is true that the discipline of today is not what it was a few years ago. It is difficult to give the real reason for this decline, as there are probably numerous contributing causes. I will mention some of these in the hope that others will be led to do the same. By this means we may be able to discover the chief causes and apply the proper remedy.

Responsibility of the Miners' Union

There is hardly a question that the organization of miners known as the "union" is very largely responsible for the lack of mine discipline observed today. This may be chiefly owing to the fact that the union does not concern itself with anything but the number of hours a man works in the mine and the wages he receives. Its constant effort is to decrease the one and increase the other of these items. The public generally considers a labor union as a fine thing, and the press tells great stories of what the union has done for the miner. If the public could visit the mines, however, and observe the manner in which work is performed by men who belong to the union, as compared with that done by nonunion men, their opinions would be quickly changed as a result of their observations.

Comparison of Union and Nonunion Mines

The following comparison of conditions existing in the mines of eastern and western Kentucky will be of interest in this connection:

While in charge of a mine in the mountains of eastern Kentucky, I had representatives of almost every nation on the globe, from the Alabama negro, who had never seen the inside of a coal mine, to first-class miners from England, Germany and France. In dealing with these men, however, I had only to place a chalk mark on the roof where a prop was needed, and the timber would be set promptly. When a miner did not understand, I would point to the chalk mark on the roof and then to the prop lying at the side of the road, and he would at once set the post before finishing the loading of his car. This mine was a nonunion mine, and as foreman I had the authority to enforce discipline by discharging anyone who violated the rules or went contrary to my instructions. The men so discharged would seldom find their way back into the mine.

Compare these conditions with those I am about to describe as observed in a mine in western Kentucky of which I had charge. The men working in this mine belonged to the union, and I foolishly thought that my worry in regard to violations of rules and regulations would now cease, as such violations could be quickly referred to the committee who comprised the business end of so great an organization. I believed this would be an effective means of stopping men from violating the rules of the mine and endangering their own and the lives of others; but, alas, I was greatly disappointed.

A Violation of the Mine Law

A few days after taking charge of the mine, I found a miner filling a cartridge with powder while his lamp was on his head. When I forbade him to do it again, he told me that it was none of my affair whether he filled his cartridge with his lamp on his head or otherwise. I replied by stating that I would send him outside at once if I found him doing the same thing again. The next day I watched and, finding that he repeated the act, I forbade him to load another car and told him to go at once to the office for his time, at the same time giving the driver orders to pull the man's coal to the bottom.

The same night the mine committee waited on me, asking that I go with them to the superintendent, which I did. The superintendent, however, flatly refused to reinstate the man, with the result that the committee reported the case to the union. The claim was made that I had no right to discharge the man, as there was nothing in the union contract giving me that authority. It was stated that the company would not have been to blame if the man had been killed. In order to avoid further trouble, the man was permitted to go back to work and the company was obliged to give him three days' pay.

A Terrible Sequel to Disobedience

The sequel to this incident is of even greater interest than the act itself, as it shows plainly the danger to a miner of disregarding mine laws and regulations made for his safety. The man worked only 32 days longer, when he was discharged by a power that he could not oppose through his union or by any other means. He was carried from the mine on a stretcher, after having received first-aid treatment that was unavailing.

While waiting for the coroner to select a jury, I could not but reflect and ask myself, as he lay there wrapped in blankets, Who is responsible for this man's death—the company, the mine committee, the district officials or myself? The court decided that the company was not responsible, since the assistant foreman testified that he had told the man not to fill his cartridge with his lamp on his head. After reading the article in *Coal Age,* I asked myself, Would it not pay every man to obey the instructions given him by the officials in charge of the mine, whether or not these are a part of the contract?

OTHER REASONS FOR LACK OF DISCIPLINE

Another reason why there is not greater discipline in the mines today is the fact that many mine officials hesitate to prosecute a man for disobedience of orders or for minor violations of the rules and regulations in force. Oftentimes the law is not sufficiently explicit and clear on the point in question or it does not specify the means to be used in prosecuting violations of the law.

Another reason is the lack of education of miners, who mostly consider that their time is worth more to them when digging coal than when setting props. Many miners think that they know more about the place where they work every day than the boss who visits it occasionally, but scarcely one out of a hundred miners sounds the roof before proceeding to work. It may be said that 50 per cent. or more of the miners cannot read or write and another 25 per cent. never look at the mine rules, while a large portion of the remainder fail to obey after they have read the rules, preferring to run the chance of prosecution for any violation of the same.

Many mine officials are themselves to blame for lack of discipline in the mines, because they consider that they have complied with the law when they have posted a copy of the mine rules and regulations. They are like the general manager quoted in the *Coal Age* article as stating that his superintendents had something else to do than to watch the men and see that they obeyed the rules that were posted.

The use of liquor may be rightly given as another cause for lack of discipline in mines. When a man goes to work still under the influence of the liquor he drank the night before, he is in no condition to obey the rules or follow the instructions given him by the foreman, especially if these call for extra exertion or labor on his part. These are some of the reasons why more attention is not given to maintaining a strict mine discipline, and yet there is no greater factor in the prevention of accidents than this. Let us hear from others. O. B.

Cleaton, Ky.

⁂

Efficient Mine Foremen

Letter No. 9—The discussion on "Efficient Mine Foremen" is peculiarly interesting, many of the views and opinions being expressed by mine foremen themselves, than whom, it must be admitted, none are better qualified to speak. These men have been "through the mill," and gained an intimate, human and material knowledge of what constitutes an efficient foreman. This is true in my own case, since I have experienced the ups and downs—principally the downs—of a mine foreman's fortunes in three different states. The number of men in my charge has varied from a mere handful to 700 or 800 employed in the mine.

WHAT CONSTITUTES A GOOD MINE FOREMAN

My experience confirms the definition I heard given by an old mine foreman some years ago as to what would constitute a good foreman. This old foreman was George Young, a member of the State Board of Examiners. The board was composed mostly of practical miners whose aspirations had enabled them to rise from digging coal at the face to official positions in the mine. In company with several others, I was taking the examination for my first certificate of competency. Sitting in the hotel lobby, after the first day's grind, this gray-haired old friend of years ago, replying to a question asked by one of the boys, set a standard that still appeals to me as a fairly accurate definition of what constitutes a good mine foreman.

He said, "My lad, the mine boss of the future, if he fulfills all that will be expected of him, besides being a practical miner, will be an athlete, diplomat, somewhat of a mining engineer and have a pretty good understanding of mechanics, chemistry and geology." While we boys took this answer as a joke, I know now that the old man was more in earnest than we thought. With the experience of the past, George Young was able to look farther into the future and knew better than we what would be required of coming mine officials. With him I can say earnestly, If ever there was a job that called for the exercise of every faculty, physical and mental, that job is the mine foreman's today.

HIGH STANDARD OF REQUIREMENTS

During the past 30 years Pennsylvania has required an increasingly higher standard of efficiency in the examination of candidates for certificates of competency to act as mine foremen and firebosses. Aside from his personal experience as a miner, the candidate must now show a certain proficiency in mathematics and a knowledge of steam and mechanical engineering, embracing the application of electricity in mining operations. Indeed, the subject last named is considered of the greatest importance, judging from the revised bituminous mining laws (1911).

To quote a recent contributor to *Coal Age,* an efficient mine foreman must possess some knowledge of human anatomy and be able to give first-aid treatment and engage in rescue work as occasion may require. His knowledge of geology and the formation of coal must be such as to enable him to develop the mine in an intelligent manner, especially if he is in charge of a small mine for the development of which he is responsible. As this contributor says, "These are but a few of the things a mine foreman must know."

SMALL SALARIES PAID MINE FOREMEN

The same contributor concludes with the remark, which he overheard made by a mine operator, to the effect that he "would be glad to pay a foreman possessing such knowledge and qualifications a salary of $2,000 a year." In regard to this last statement, I know personally many practical, well-informed mine foremen capable of managing a mine as economically and safely as conditions will permit who receive little more than half the sum mentioned. Close observation and acquaintance with all classes of salaried men, not mining men alone, only deepen the wonder that such men, possessed of a practical knowledge of mining and having attained a certain degree of technical efficiency by the use of midnight oil or otherwise, should be compelled to accept the small remuneration offered for their services.

No doubt the chaotic condition of the mining industry, with its cut-throat competition, which frequently compels the operator to sell coal at or near the cost of its production, accounts for the meagerness of the salaries paid the men who have charge of the mines and who shoulder the heaviest responsibilities in their relation to the company, the men and the commonwealth One thing I do know is that for every superintendent, to say nothing of mine foremen, who receives $2,000 a year I can point out a dozen who receive less than that amount. If anyone doubts this statement, I would suggest that he insert in *Coal Age* a small advertisement calling for an efficient mine foreman possessed of such knowledge and qualifications as mentioned and stating that he will be paid the salary named. The result, I venture to predict, would be a flood of applications from as well-qualified foremen as there are in the United States or any other country.

AN IMPOSSIBLE TASK OFTEN EXPECTED

While admitting that many mine foremen fall short of the standard of efficiency that they might attain, it is equally true that many coal companies expect too much of their foremen, who in many instances are compelled to produce results with no resources at hand that will enable them to do this, even though possessed of a store of knowledge and experience. In many cases the natural conditions or the equipment of the mine makes the production of cheap coal an impossibility. The best foreman living cannot rehabilitate an old mine and produce results at once, though he is often expected to accomplish a miracle. Some mines, like some lives, require time to overcome a long period of dissipation and misuse.

Perhaps there was some humor in the remark of Thomas Hogarth, *Coal Age,* Oct. 9, page 601, stating that "the trouble with most mine foremen is that they spend too much time in one place." I can hardly repress a smile as audible as the voice with which a mine mule calls for his dinner when I think of it. On coming out of the mine a few days ago in company with a sturdy Briton, I drew his attention to this statement of Mr. Hogarth's. Turning fiercely about, he exclaimed, as he wiped the heavy drops of sweat from his face and forehead: "What's he mean be that? Does he mean we sit around too much?" And turning in the direction of his well-earned supper and repose, he added, "A man's more apt to be runnin' his bloomin' legs off than to be sitting around."

Perhaps Mr. Hogarth refers to days long since gone by when miners practically all spoke English and were of average intelligence with the foreman himself. The mine being small and the coal hauled by mules, there was little or nothing to go wrong, and the foreman could sit for an hour or two at the side of the track or in the fireboss' shanty and enjoy a rest. But in these days, when the law requires the foreman or his assistants to visit every working place at least once a day, there is not much danger of his wearing a smooth place on the bench at the side of the track.

A MINE FOREMAN'S ACTIVITIES

As an illustration of the activities of the average mine foreman, I would cite my usual experience when visiting a mine. At the office I am told by the superintendent, "You'll find John inside somewhere." Inquiry of the motorman brings the response, "Why, the boss went up the mains a bit ago." Proceeding up the main entries, I find a driver who says, "I seen him headin' up the third-left." Following the trail through all the rooms on the third-left and then through a crosscut down the fourth-left, a trapper-boy there offers the information that "No. 23 room on fifth-left cut through last night into an idle room off the fourth. Probably the boss went through there to the fifth-left."

Giving up the chase of this foreman on his marathon, I determined to wait his reappearance. Musing on this incident, I conclude that there are many "Johns," in many mines in many states, who do too little sitting down. Most of the foremen I have known, and feel honored to know, are overzealous in their employer's interests, which are more on their minds than the thought of the small salary they are paid. I would say that their error, if such it can be called, lies in attempting to do more than one man can accomplish.

In conclusion I would state that the qualifications that mark an efficient mine foreman are much the same as those that indicate efficiency in other lines of endeavor. The man must know his work and do it, regardless of intimidation from any source. In few vocations do the lives of men depend so much on one man's actions as in mining. The mine foreman must be sober and coolheaded, a leader of men and a firm disciplinarian. He must be sure he is right, firm in his convictions and a student of human nature as well as the principles of mining. Without these elements he cannot hope for success. But to understand and handle men he must understand and be able to handle himself. SIM. C. REYNOLDS.

Houston, Penn.

Letter No. 10—The letter of Wm. Crooks, *Coal Age,* Sept. 4, page 394, in which he told of the great improvements made in a mine by a new foreman, recalls a similar incident in my own experience.

The foreman of a certain mine on giving up his place was asked to recommend a man for the position. To the surprise of all, he recommended a new man who had never been in the mine and was unacquainted with the conditions. This, however, was not the worst feature of the change, as will soon appear.

THE FOREMAN AND HIS ASSISTANT

The assistant foreman in this mine had held his position for ten years, and the miners naturally expected that he would be promoted and made foreman when that official resigned—not that they expected to derive any advantage themselves from his appointment, but they thought he had earned the right to the place by his work for so many years. When the new foreman took charge, the assistant foreman was retained and continued to perform his duties as before. But as time went on, more work was left for him to perform, and he practically ran the mine, assuming the most of the responsibilities. The new man was a drinker and was almost sure to get on a "toot" every Sunday.

CONDITIONS IN THE MINE GREW WORSE

The assistant carried out the orders of the foreman to the letter, doing many things contrary to his own judgment, and as a result conditions in the mine grew rapidly worse. The ventilation was poor, the air at the working face being so bad that the men could not work full time, owing to headache and other ailments.

Things went on this way for a time. When the committee complained to the foreman, he smoothed matters over very nicely, and they were loath to take the matter up with the superintendent. The mine was an old mine, there being two or more miles of abandoned entries having no tracks, where roof falls were hard to clean owing to the distance the dirt must be handled. The air became so bad on the main haulage roads that drivers could not hold their lights, and the oil lamps at the shaft bottom refused to burn. I was running a motor at the time, and in places where the roof was bad on the road I was afraid to ride the machine under the bad top. I would send the rider ahead and, starting the machine slowly, permit it to run alone until it had passed the bad place and was stopped by the rider. I would then walk by the place myself and in this way escape injury. In some places water stood over the roads.

The Assistant Appointed Foreman

The foreman gave little attention to affairs in the mine, but became interested in an elevator that was situated in the next town. In about a year he purchased a half-interest in the elevator and signified his desire to quit the mine, recommending his assistant for the place. Although the assistant had done practically all the work and had taken the full responsibility, the superintendent hesitated some time, but finally decided to give him a chance and appointed him as mine foreman. It was a hard proposition, but the man now appointed knew what was needed in the mine and started at once to improve its condition. In a short time he made a remarkable showing. The ventilation was greatly improved, the roads well drained, although he found this could be accomplished with the use of four pumps instead of seven as before, by draining the water into the same basin, by small ditches that cost practically nothing.

Before giving up his place, the previous foreman had ordered a car of iron rails. This arrived after the assistant had been promoted to the position of foreman. Not needing the iron, he had the rails neatly piled in a good place outside the mine, where they remained untouched for a year. He did not permit a single track tie to be sent into the mine, but instead made use of the old ties of abandoned tracks that had been thrown aside. He increased the output to 1,100 tons a day, without incurring any additional expense.

I cite this as an instance showing that the superintendent was not a good judge of men. He either did not know or did not care what his foreman was doing in the mine, but relied wholly on his judgment. I hope that this discussion will open the eyes of many superintendents and cause them to come into closer touch with their foreman and know his qualifications, as well as those of his assistants, any one of whom may be required to take the foreman's place at a future day.

Cleaton, Ky. OSTEL BULLOCK.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

CUBIC MEASURE

1728 cubic inches = 1 cubic foot
27 cubic feet = 1 cubic yard
16 cubic feet = 1 cord foot
8 cord feet = 1 cord.................128 cubic feet

A **cord of wood** is a pile 8 ft. long, 4 ft. wide and 4 ft. high, and contains 8 × 4 × 4 = 128 cu.ft.

A **cord foot** is one foot of the length of the pile that makes a cord, and contains 1 × 4 × 4 = 16 cu.ft.

A ton of **round timber** (green) is taken as 50 cu.ft.

A ton of **squared timber** (green) is 40 cu.ft., it being assumed that hewed or squared timber has lost one-fifth of its original volume in squaring.

A long ton (2,240 lb.) of **anthracite** or a short ton (2,000 lb.) of bituminous coal broken (mine-run) occupies about 40 cu.ft.

There are two measures of capacity, known as "Liquid" and "Dry" measures, having like denominations but of different values. The old English wine gallon (231 cu.in.) was replaced in England, in 1824, by the imperial gallon (277.274 cu.in.), but is still the standard "Winchester" gallon in the United States. The "Dry" gallon, now practically obsolete, contained 268.8 cu.in.

LIQUID MEASURE (U. S.)

4 gills = 1 pint.................28.875 cubic inches
2 pints = 1 quart.................57.75 cubic inches
4 quarts = 1 gallon.................231 cubic inches
31½ gallons = 1 barrel.................4.21 cubic feet
2 barrels = 1 hogshead.................63 gallons
2 hogsheads = 1 pipe.................126 gallons
2 pipes = 1 tun.................8 barrels

DRY MEASURE (U. S.)

2 pints = 1 quart.................67.2 cubic inches
8 quarts = 1 peck.................537.6 cubic inches
4 pecks = 1 bushel.................2150.4 cubic inches
36 bushels = 1 chaldron.................44.8 cubic feet
Or, 4 quarts = 1 gallon.................268.8 cubic inches
8 gallons = 1 bushel.................2150.4 cubic inches

The standard bushel, in the United States, is the old Winchester bushel, which is a circular measure 18½ in. in diameter and 8 in. deep, contaning 8 (0.7854 × 18.5^2) = 2150.4 cu in. This was replaced in England, in 1826, by the imperial bushel (2218.192 cu.in.), which was then made the legal bushel.

LIQUID AND DRY MEASURE (GREAT BRITAIN)

4 gills = 1 pint.................34.659 cubic inches
2 pints = 1 quart.................69.318 cubic inches
4 quarts = 1 gallon.................277.274 cubic inches
2 gallons = 1 peck.................554.548 cubic inches
4 pecks = 1 bushel.................2218.192 cubic inches

The Coal Age Pocket Book

There is no separate standard for liquid and dry measures in Great Britain, both being referred to the same unit or standard, which is the imperial gallon (277.274 cu.in.).

MEASURE OF TIME

60 seconds = 1 minute
60 minutes = 1 hour
24 hours = 1 day
7 days = 1 week
365 days = 1 common year
366 days = 1 leap year
12 calendar months = 1 calendar year
100 years = 1 century

Commonly speaking, **a day** is marked by one complete revolution of the earth on its axis, and **a year** by one revolution of the earth in its orbit about the sun. Unfortunately, however, the earth does not make an even number of turns on its axis, while making one complete revolution in its orbit. There are approximately 365¼ revolutions on the axis to a single revolution in the orbit.

In order to compensate for this eccentricity and make the calendar year conform as closely as possible to the solar year, so as to preserve uniformity in the return of the seasons, it was necessary to add one day to the calendar every fourth year, except the closing year of the century. Thus, the **common year** of 365 days was supplemented by a **leap year** containing 366 days.

The "Gregorian" calendar, established by Pope Gregory XIII (1582) and generally adopted in Great Britain and elsewhere (1752), replaced the "Julian" calendar and, in dropping 10 days by making Oct. 5, Oct. 15, 1582, restored the equinoxes to their proper date. To obtain closer correspondence of the calendar and solar years, the closing year of each century, 1600, 1700, etc., was made a common year, although these would be leap years in the regular course.

The Day—A day is the interval of time marked by two successive transits of a heavenly body across a given meridian, caused by the revolution of the earth on its axis.

The **solar day** (24 hr., 0 min.) is the time interval marked by two successive transits of the sun across the meridian.

The **sidereal day** (23 hr., 56 min.) is the time interval marked by two successive transits of a fixed star across a given meridian.

The Month—The calendar year has been arbitrarily divided into 12 months, in correspondence to the "number of moons" or the revolutions of the moon about the earth in a solar year. But, since 365 days are not equally divisible by 12, it was necessary to make an unequal division, as follows:

January	31 days	May	31 days	September	30 days
February	28 days	June	30 days	October	31 days
March	31 days	July	31 days	November	30 days
April	30 days	August	31 days	December	31 days

The extra day required in a leap year is added to the month of February, making 29 days in that month every leap year, instead of 28 as in the common year.

Inquiries of General Interest

Miners' Compensation Act

Referring to the discussion in *Coal Age* relating to the compensation of miners as provided by the recent act of the Pennsylvania Legislature and the effect on the constitutional rights of the miner as an individual, I would like to submit a question to the readers of *Coal Age* asking them for their opinion in regard to the effect of this act on the miner who avails himself of the option of rejecting its provision, preferring to hold himself free for the exercise of his constitutional right to apply for redress to the district courts, in case of accident or injury in the performance of his regular duties in the mine.

To illustrate the point I have in mind, permit me to anticipate both the time and ratification of this act and to infer that it has become operative as it now reads. Then, assuming that the operator or employer avails himself of the option of accepting or rejecting the provisions of the act, he has simply to notify his employees to that effect, in writing, and to file the same notice with the State Bureau of Workmen's Compensation of the Department of Labor and Industry, within ten days after such service and before any accident has occurred in the mine.

I do not mean to infer that an employee is legally compelled to follow the example of his employer in accepting the provisions of the act. If he desires to maintain his constitutional rights, he has the option of rejecting the provisions of this act and seeking employment elsewhere. But by the reading of the act (sec. 302), the failure on the part of an employee to reject the act implies its acceptance, and the law construes it as such an acceptance.

The question I would like to ask is this: Does not this proviso of the act give the employer the power of dictating to those whose conditions and circumstances compel them to comply with his choice of the conditions under which they must serve while in his employ? In other words, does it not give the employer the power to dictate to his employees the conditions under which all operations in his mine shall be conducted, irrespective of the constitutional amendment? I would characterize this as a legal "duress," because it empowers the employer to compel an employee's compliance with certain demands, however unwilling the latter may be because of the exigencies of his condition, which leave him no alternative but to obey the dictates of his employer. As I understand it, the new act sanctions such compulsory compliance. If I am wrong, I shall be glad to be set right in this matter. A. M. INER.

——, Penn.

Correspondent has raised an interesting question, although in our opinion he has overestimated the meaning of the act. Sec. 302 of Art. 3 of this act reads as follows:

> In every contract of hiring made after Dec. 31, 1915, and in every contract of hiring renewed or extended by mutual consent, expressed or implied, after said date, it shall be conclusively presumed that the parties have accepted the provisions of Art. 3 of this act and have agreed to be bound thereby, unless there be, at the time of the making, renewal or extension of such contract, an express statement in writing from either party to the other, that the provisions of Art. 3 of this act are not intended to apply, and, unless a true copy of such written statement, accompanied by proof of service thereof upon the other party, setting forth under oath or affirmation the time, place and manner of such service, be filed with the bureau within 10 days after such service and before any accident has occurred.
>
> Every contract of hiring, oral, written or implied from circumstances, now in operation, or made or implied on or before Dec. 31, 1915, shall be conclusively presumed to continue subject to the provisions of Art. 3 hereof, unless either party shall on or before said date, in writing, have notified the other party to such contract that the provisions of Art. 3 hereof are not intended to apply, and unless there shall be filed with the bureau a true copy of such notice, together with proof of service, within the time and in the manner hereinabove prescribed: Provided, however, that the provisions of this section shall not be so construed as to impair the obligation of any contract now in force.

In our understanding of the act as it reads, either party to a contract of employment has the option of accepting or rejecting the provisions of Art. 3 of the act, notice of such acceptance or rejection being given in writing to the other party and likewise filed with the bureau, as stated in the act. Or the acceptance or rejection of the act, on the part of an employee, may be implied if he continues to serve his employer after having received due notification in writing of the latter's acceptance or rejection of the provisions of the act, provided the said employee fails to notify his employer, in writing, of his own acceptance or rejection of the same act.

That is to say, if an employee makes no response to the written notice of his employer his silence is an implied agreement to accept or reject the provisions of the act, in common with the choice indicated in the notice he has received. On the other hand, if an employee chooses to pursue a different course from that of his employer he must notify the latter, in writing, of his election in respect to the act, and file a copy of such notice with the State Compensation Bureau, in accordance with the requirements of the act, within ten days of the time of serving the original notice.

The law should not be interpreted in the sense of a compulsory act, as suggested by correspondent. On the contrary, the intention of the act is quite the reverse, providing, as it does, the option of accepting or rejecting its provisions, as either party to the contract may elect. For, assuming an employer accepts the provisions of the act, any employee who so desires can reject its provisions by giving due notice in writing to his employer and filing the same with the bureau. He can then continue to serve his employer, although having rejected the provisions of the act. In that case, however, he is not entitled to recovery for injury, except through due process of law as before the act was in force.

Coal Age will be glad to have its readers discuss this aspect of the law further. An interesting question would be, In case an employer rejects the provisions of the act, could one of his employees, by accepting the said provisions of the act, recover from the employer in case of accident?

Examination Questions

Recent Iowa Examinations for Hoisting Engineers

(*Selected Questions*)

Ques.—How can you tell when the valve of an engine has lead, without opening the chest, if there is no punch mark to go by?

Ans.—An indicator card taken from the cylinder of the engine will show, by its point of compression and compression curve, how much lead the valve has been given. Without reference to the indicator card, however, the simplest method of determining this question is to rotate the engine to a point just short of dead-center. Then, having opened the drip-cock, at the end of the cylinder occupied by the piston, "crack" the throttle. That is to say, open the throttle just a crack to admit steam sufficient to blow through the cylinder and escape by the drip-cock, without moving the engine. If steam escapes at the drip-cock in this position, before the piston has reached the end of its stroke, it indicates that the valve has a certain lead. To determine approximately how much lead there is to the valve, rotate the engine backward from this point and observe when steam ceases to escape at the drip-cock. In this answer, we assume that there is no leakage of the valve, which would of course interfere with the test.

Ques.—If the length of the stroke of an engine is 2.5 ft. and the piston speed 900 ft. per min., what is the number of revolutions?

Ans.—The question intends to ask how many revolutions does the engine make in a minute. The number of strokes per minute is found by dividing the piston speed (feet per minute) by the length of stroke in feet; thus, $900 \div 2.5 = 360$ strokes per min. Since an engine makes two strokes to every revolution, the number of revolutions per minute is $360 \div 2 = 180$ r.p.m.

Ques.—Which will stand the greatest inside lap, a condensing or a noncondensing engine?

Ans.—Inside lap to a valve means an earlier closing of the exhaust port, when compression begins in that end of the cylinder. A condensing engine will stand a greater inside lap than a noncondensing engine, because of its greater range of pressure, which extends from below the atmospheric line to the full cylinder pressure. An earlier point of compression on the indicator card of a condensing engine will show a less percentage of loss in the indicated power of the engine than would be the case in a condensing engine under the same conditions.

Ques.—If you were in charge of a boiler and the glass water gage should be broken, what would you do?

Ans.—Close the lower cock of the gage and then the upper. For this purpose, there should be kept in the engine room an iron rod of suitable length and provided with a shank that will permit these cocks to be turned without the person being scalded by the escaping steam. If the upper cock were to be closed first, a spray of scalding water would be thrown from the lower cock. To avoid this, the lower cock must always be closed first. The engineer should keep on hand a supply of gage glasses, and insert a new glass at once in place of the one broken.

Ques.—What is an eccentric?

Ans.—An eccentric is a circular disk having a grooved circumference in which is fitted a ring that is made fast by a suitable connection to the end of the eccentric rod. The eccentric is mounted on the crankshaft, the center of the disk being at a distance from the center of the shaft equal to half the throw of the valve. The eccentric serves the same purpose as a crank to throw the valve backward and forward at each revolution of the shaft, the eccentric disk revolving within the ring that encircles its circumference.

Ques.—What are the results of the forming of scale in a boiler, and how would you prevent the formation of scale?

Ans.—The formation of scale in a boiler reduces its efficiency. The scale prevents the free transmission of the heat of the furnace to the water within the boiler and decreases the generation of steam per pound of fuel burned. Scale is also a menace to the safe operation of the boiler. Boiler plates covered with scale are apt to become overheated, and it frequently happens that the cracking of the scale allows the water to come suddenly into contact with the red-hot iron, when an explosion is almost sure to follow.

The best means of preventing the formation of scale in a boiler is to use as pure water as possible. All feed water contains more or less sediment, which is liable to accumulate from time to time in the boiler. To avoid this the boiler should be partly blown off at frequent intervals, the frequency depending on the amount of sediment in the water. Where this sediment accumulates as mud in the bottom of the boiler or in the mud drum, the boiler should be completely blown off at regular intervals, say at least once a week, and the accumulated sediment removed from the boiler by scrapers.

Where the water contains salts, such as carbonates or sulphates of lime and magnesia, these are precipitated by the boiling of the water. The precipitated salts form a hard crustation or scale that adheres firmly to the boiler plates and tubes. Sulphate of soda is frequently used in waters containing a small quantity of salts of the alkaline earths; it reduces these to a soluble sulphate of soda and carbonate of lime and magnesia. The former is carried in solution in the water, while the latter falls as a light sediment that does not scale and is readily blown out of the boiler.

Feed-water heaters assist the purification of the water entering the boiler. It has been found of advantage to add a small amount of petroleum or coal oil to the feed water. The oil has the effect of coagulating the sediment and preventing to a considerable degree the formation of scale. All feed water containing impurities should be subjected to analysis to determine its best treatment.

Coal and Coke News

Washington D. C.

Van H. Manning, chief of the Bureau of Mines in an interview given out here, takes the view that the bureau is serving an unknown and valuable end in preparing a corps of men who would be at once available for war hospital srevice, should such a need arise.

"In 48 hours," he says, "50,000 trained first-aid-to the injured experts could be mobilized in the great mining states of the country. I mean the trained mine rescue crews. Since 1908 the Bureau of Mines has done extensive demonstration and training work among men in the mining companies throughout the country. Every mine of importance now has its corps of trained rescue workers. These men are thoroughly expert in all sorts of bandaging, treatment of minor fractures, sterilization of wounds and probing for foreign objects in the body.

In addition they are trained to use the oxygen helmet which will permit them to enter places where the air is too poisonous to be breathed. In all mining states there is an annual mobilization of these potential hospital workers. Competitive drills are performed by the crews. This keeps the men in perfect training, accustoms them to working together, and insures the certainty of quick mobilization in time of war.

Another important feature of a hospital service and one for which we are directly responsible is base railroad cars containing the necessary supplies and bunks for the first aid corps. We have eight such cars—a good nucleus for a complete service in wartime—and with scarcely any change in apparatus they would be ready to carry the crews as near a battle front as need be."

Report on Corporation Legislation

The Federal Trade Commission has issued a report prepared by the Bureau of Corporations regarding state laws relating to corporations organized under the laws of other states. It collects the laws of all states regarding the conditions under which such corporations may do business, etc. A companion report just issued details the main points in the laws of the Southern and Southwestern states for the taxation of corporations. Both reports are of considerable interest.

HARRISBURG, PENN.

About a year ago a medical inspection in the anthracite region showed that in one of the Nanticoke schools a large percentage of the children were tubercular or were subject to tuberculosis. This report was taken up by Dr. S. D. Dixon, commissioner of health of the state, through his bureau of housing of which John Moliter, a Philadelphia architect is the head. From time to time Moliter visited this section and by his own plan his reports, particularly his recommendations, have been translated for the foreign papers having a large circulation in the Nanticoke region.

First there was an investigation of the housing conditions, showing that the tubercular condition of the children, and other signs of poor health were easily traceable to the great insanitation and disorder that prevailed. Subsequent visits followed up the recommendations that were made. Officials of the operating coal company, coöperated with Mr. Moliter, who now reports to the state commissioner, with much satisfaction that the district is on its way to great improvement.

As a result of this spirit of coöperation maintained by the head of one of the largest coal companies, additional residence sites have been opened up and sold cheaply on easy terms to the employees and at present 17 houses are under construction, besides a large Lithuanian church. These will help to relieve the overcrowding among the foreigners, one of the chief faults. It is also planned to open other blocks for building purposes as soon as the working people are in a position to proceed with the financial end of the undertaking.

The district has also improved by the cleaning up of dumping grounds, repairing of underground drains and the removal of surface drains and the cleaning up of cattle and hog pens. Several suspicious wells and sources of water supply have also been abandoned according to instructions.

Through the State Health Department's interest Mr. Moliter first started his work in the Nanticoke district in March of this year and has followed it up with the gradual process of education, recommendations, urging and threats of litigation, which have combined to bring about this promising result.

PENNSYLVANIA

Anthracite

Pottsville—Judge Brumm on Oct. 21 adjourned court at noon, and with a dozen state mine inspectors and engineers visited the Kehley Run Colliery, where it is alleged the removal of pillars will sink millions of dollars worth of real estate.

Hazleton—It is stated that in a colliery of the G. B. Markle Co. at Jeddo recently a miner, William Meehan, found a perfectly formed petrified snake. This is held as evidence by some people as upsetting the theory that coal was formed when only vegetable life existed on the earth.

The Lehigh Valley Coal Co. has announced that it expects soon to commence extensive stripping operations in this vicinity and at Buck Mountain and Oneida. It is expected in this way that large quantities of anthracite will be taken out by this labor-saving method, while at the same time employment will be given to many men.

Scranton—Supt. Weber, of the Board of Education, has reported that 25 students had enrolled in the night school to study mining. The instructor is Frank Gleason, a graduate of State College and a practical mining man. The text-book used is by Joseph J. Walsh, of Wilkes-Barre, mining inspector in the Ninth District.

Mahanoy City—The Buck Mountain and Vulcan collieries of the Lehigh Valley Coal Co. were recently compelled to suspend operations on account of a scarcity of cars. Most of the other operations throughout the immediate vicinity, however, have been enabled to work full time for some weeks past.

Catawissa—The series of freshets and absence of low water on the river throughout the summer have made the season a favorable one for coal dredges. The quantity of coal removed from the river since spring exceeds the product during any other year on record. The comparatively high water has enabled the dredges to move wherever they pleased. The field of operation of these machines has been accordingly much enlarged.

Swoyersville.—Frank H. Hemelwright, general manager of the Temple Coal & Iron Co., has announced that his firm will recompense the owners of property on Slocum street, Swoyersville, damaged by a mine cave caused by quicksand running into the workings. Two houses of Thomas Quigley were engulfed to the second story and irreparably damaged. Two neighboring houses owned by John Hayden were also damaged. Mr. Hemelwright stated that the hole through which the quicksand ran into the workings was small.

Pittston—It is understood by local officials of the Lehigh Valley Coal Co. that this firm has decided to purchase automobiles for the use of many of its division officials within the next six months. The division superintendents already have cars purchased by the company. Electricians, efficiency men and engineers will likely come under the new order.

Another of the spasmodic subsidences on Upper William street has endangered the tracks of the Moosic line of the Scranton Railway Co. and has caused the company to transfer passengers at the Erie crossing. The disturbed surface overlies the workings of the Pennsylvania Coal Co. There has been caving in this neighborhood for over a year.

Wyoming—Three hundred employees of the Mt. Lookout Coal Co. recently attended the fourth annual banquet of the Mt. Lookout First Aid Corps here. James H. Evans, of Forty Fort, was toastmaster, and the speakers were local clergymen and mining officials.

Bituminous

Harrison—The Quemahoning Creek Coal Co. with large operations in Somerset County has purchased some new machinery to be installed at its plant here. A new tipple is being erected and equipped with a new picking table, which will enable the company to increase its output.

Allenvale—Two hundred mine workers employed by the Valley Smokeless Coal Co. walked out for the second time recently. The trouble was over the scales used for check-weighing. The miners at the first strike demanded a checkweighman at the tipple and a pit committee. This was allowed by the company. As soon as the checkweighman got on the job he advised the miners he thought the scales were short weight. This resulted in a second strike. At a conference between the officials of the company and the men it was decided to get the State Sealer of Weights and Measures to test the scales which were found correct. Not being satisfied with the test the miners decided to run a few cars of coal from the mine and have them weighed. To this the company agreed, and as the scales were again found to be correct the miners returned to work.

Connellsville—The production of coke in the Connellsville region recently amounted to 421,000 tons, with shipments amounting to 422,000 tons. These are decided increases over previous weeks, and ovens are being fired as fast as the labor to operate them can be secured.

Kittanning—It is reported that the Kittanning Iron & Steel Co.'s plant will start in full about Dec. 15, giving employment to 800 men. The Furnace Run Coal Co. near this town has announced that it needs 500 men immediately.

WEST VIRGINIA

Charleston—According to Earl Henry, chief of the state department of mines, the labor shortage in the mining fields, especially in the northern part of West Virginia, is growing acute, and unless more men are found within a short time many interests besides the mines will be affected. Mr. Henry states that insufficient labor makes it impossible at present for many mines to be operated to a point where orders can be filled.

The United States Coal & Coke Co., operating in McDowell County, has withdrawn its suit against State Compensation Commissioner Lee Ott asking a mandamus to compel him to release the company as a subscriber to the compensation fund. The company dismissed the suit, it announced, to avoid creating the impression that it was seeking to escape the payment of its obligations or to destroy the state compensation fund, although the suit was brought because the company believes it has the right to carry its own compensation insurance.

The old mine of the Stillman Coal Co. on the West Virginia side of the Ohio River will be put in operation within a few weeks, after a suspension of several months. This mine was recently leased by the coal company, and the leasee is said to be in possession of orders for its product. Twenty men are now engaged in cleaning out the mine and when this work is completed a force of 100 miners will be employed.

Moundsville—The Mound mine recently resumed operations and will continue for some time. Only one side of the mine, however, will be operated and no shipments will be made, the output being for local trade only.

Bluefield—The Norfolk & Western R. R. during the month of September handled 2,910,221 tons of coal, compared with 3,005,618 tons during August. Every month since last June has marked an increase in the amount of tonnage handled with the exception of September, which fell short of August shipments. It is believed that September would have shown another high record had it not been for five days of congestion at Lambert Point, which curtailed the output of the mines considerably. In any case, however, the tonnage of the road has increased 1,871,007 tons in four months time. It is believed, also, that the total shipments to the end of October will be equal to all the coal shipped during the year 1914.

ALABAMA

Birmingham—An explosion occurred recently at the Banner mine at a time when no one was in the workings. The cause of the explosion is unknown. It was thought for a time that fire had been set to the timbers and mine, but later investigations proved this not to be the case. Damage due to the explosion appeared to be confined to a small portion of the mine workings.

KENTUCKY

Louisville—Local shippers, coal operators and commercial organizations as well as railroad authorities have received appeals from the Interstate Commerce Commission asking that they do all in their power to expedite the use of cars so as to rob the present car famine of as many of its drawbacks as possible. It is urged that the railroad officials do what they can to prevent congestion of cars at terminal points and that shippers unload them as expeditiously as possible so as not to keep them out of service.

After a "suggest-a-name contest" which the Harlan Coal Co., operating mines in Harlan county, began in August, ran for about two months the company has selected "Black Beauty" as the trade name for the coal it handles. The provisions of the contest were stated to about 4,000 retail dealers in the 16 states in which the company does business. More than 900 names were received in response. Nine dealers suggested the name adopted and the prize, a car of "Black Beauty" lump was awarded to Fisher Brothers, of New Paris, Ind., the first of the nine to offer the suggestion.

Stearns—Mines around here are in regular operation and vacant miner's homes are being rapidly occupied. Construction of a new tipple at Mine No. 4 is under way and additions are being made to the tipple at Yamacraw.

Whitesburg—The Kentucky Block Coal Co., operating near Elkhorn City on the newly completed Carolina, Clinchfield & Ohio R.R., will soon begin its initial shipments to South Atlantic coast points. A mining town is being constructed and the company will have an initial capacity of 2,000 tons daily.

Middlesboro—Handling of the rush coal business in this section was the principal matter considered at the recent meeting here of the Southern Appalachian Coal Operators' Association. Fifty operators were present, including representatives from Cincinnati, Covington, Louisville and Knoxville.

Hazard—The Blue Grass Coal Co. is rapidly getting into readiness to make its first shipments of coal from the new plant immediately below Hazard on the Louisville & Nashville R.R. The company will have a daily capacity of 1,000 tons, which will be increased from time to time.

OHIO

Bellaire—What is said to be a record for the output of coal from one mine in Ohio was recently established at the No. 1 mine of the Rail & River Co., when 2,631 tons were mined and sent out. The output for three consecutive days was 7,500 tons. About 450 men are employed in this mine.

Columbus—The Modern Coal Mining Co., has started loading coal at the stripping operation at Parlette, Jefferson County. The initial capacity is 300 tons daily which will gradually be increased to 800 tons.

INDIANA

Princeton—After three-weeks idleness the 350 men of the Princeton mine who have been on strike have returned to work and several hundred more have resumed in the Terre Haute field. Points at issue, involving discharge of two men, will be left to the International Board of the United Mine Workers, work being resumed pending adjudication of the contentions. The mines here and at Terre Haute are owned by the Deep Vein Coal Co., of Terre Haute.

Sullivan—After a shut down of three weeks, the Chicago-Carlisle Coal Co.'s mine has been reopened for work, pending a settlement of a difficulty resulting from the removal of a curtain from one of the mine entries, thus allowing bad air to get into the rooms.

Vincennes—Option has been taken on 3,000 acres of land between this city and Lawrence, Ill., in the interests of a large coal company. The owners are to receive $25 an acre. In drilling for oil in this field seams of coal of varying thicknesses have been found at depths of 300 to 700 ft.

ILLINOIS

New Baden—The statement that the New Baden mine of the Southern Coal, Coke & Mining Co. is to be closed and customers supplied from the Little Oak and Shiloh mines near Belleville, is said to be incorrect. The company has so many orders for New Baden coal that it is said the mine will be operated regularly and indefinitely. The Little Oak and Shiloh operations are also working regularly.

O'Fallon—Copper wire to the value of $300 was stolen recently from the Taylor Coal Co., which operates the St. Ellen and Ridge mines. The wire was used for power transmission between the mines. Tracks showed that the thieves came in a wagon the first night and took part of the wire and returned the next night in an automobile and finished the job.

Carterville—W. E. Trautmann, of East St. Louis, receiver for the Carterville Coal Co., on Oct. 20 sold the Burr C mine and holdings here at auction. It was bid in by the Mississippi Valley Trust Co., of St. Louis for $43,000 to protect its mortgage for $38,000 and accumulated court costs. This leaves an unpaid indebtedness of about $40,000, of which $20,000 is wages due employees. The mine has been closed down since last March. Frederick Vierling, trust officer of the Mississippi Valley Trust Co., announces that no plans have been made for resuming operations. The mine employs 300 men when working.

MISSOURI

Columbia—A 3-ft. bed of coal was discovered at a depth of 20 ft. recently by workmen digging footings for the basement walls of a moving picture theatre. Although large portions of Boone County are underlaid with coal measures at varying depths, this is the first time that coal has been found inside the corporate limits of Columbia. This coal will not be developed.

IOWA

Des Moines—The new Iowa Industrial hospital will be opened within 60 days. Remodeling has been inaugurated and an entire expenditure of $100,000 will be made. The institution is to be operated especially for the convenience of coal miners and is to be equipped with special facilities to care for accident cases.

COLORADO

Greeley—It has been stated that the American Coal Tar Products Co. has been experimenting with coals from the mines about Erie and Frederick and that it contemplates erecting a factory to manufacture analines and other coal-tar products therefrom.

WYOMING

Kemmerer—The mine of the Roberts Coal Co. near town was destroyed by an explosion recently and up to the present time there is no clew as to whom the guilty parties may be. The mine had been closed Saturday after the day's work, and the door to the mouth of the tunnel locked. Underneath the door was a small hole in which tools were kept, and from here an axe was taken with which the door was evidently broken in. The rope attached to the mine car was cut and the car run to the back of the mine. There was a quantity of powder and fuse there which was exploded, completely wrecking the inner part of the property.

PERSONALS

Carl Scholz, president of the Rock Island Coal Mining Co., left Chicago Oct. 18 for Oklahoma to spend a short time at the company's mines.

M. Marks, field representative of the Hirsch Electric Lamp Co. of Philadelphia, is in the Pittsburgh district supervising some new installations of his company's equipment.

H. J. W. Reed, assistant inspector of mines of Kentucky, is out on his regular inspection of the mines in his territory, which includes Breadhitt, Laurel, Lee, McCreary, Morgan, Perry and Rockcastle counties.

J. M. Roan, of Athens, Ohio, mine inspector, assisted by several deputies and the mine rescue car opened Poston Mine No. 6 of the Poston Consolidated Coal Co. recently. The mine had been sealed for six weeks because of a fire. Upon opening the mine and entering the entries with helmets it was found that the fire was extinguished and but little damage had been done. The mine will be placed in operation soon.

OBITUARY

George Kroeger, of Chicago, in Boonville, Ind., for the past year optioning coal lands in that vicinity, recently died suddenly of heart disease. A daughter living in Chicago survives him.

Horace G. Williams, a mining engineer of prominence, died recently in Philadelphia after an illness covering two years. Mr. Williams was 55 years of age, having been born in Minersville, Penn. After being employed in his professional capacity in that vicinity for a number of years, he became interested in the coal and lumber business in the South. He was at one time president of the Street Railway Co., of Portsmouth, Va., and also acted as receiver for the Beaver Creek Railroad & Lumber Co.

INDUSTRIAL NEWS

Toronto, Ont.—The Brule Lake Coal Co., Ltd., has been incorporated by the Mackenzie & Mann interests, with head office in Toronto, Ont., and an authorized capital of $200,000.

Little Rock, Ark.—The Thomas Adams Fuel Co., of Little Rock, Ark., has been incorporated with a capital stock of $10,000. The incorporators are T. W., T. O., V. C. and F. E. Adams.

Philadelphia, Penn.—The launching has just taken place of the "Virginia," a coal carrying ship built for the Pocohontas Coal Co. The vessel has a capacity of 7,000 tons exclusive of bunker coal.

New Orleans, La.—Collier No. 1, property of the Monongahela River Consolidated Coal & Coke Co., which was sunk at this port in the hurricane of Sept. 29, at a loss of $75,000, will be raised. Divers are now at work.

Clarksburg, W. Va.—The Balkan Coal Co. was recently organized with a capital stock of $50,000. The incorporators are J. E. Long, C. B. Johnston, B. H. Monroe, Fred Radford and M. Stuart, of Clarksburg, W. Va.

Guthrie, Okla.—The Milton Coal Mining Co. has been incorporated with a capital stock of $14,000. The incorporators are Henry E. Johnson, of Perry; J. E. Woodworth, R. J. Conneway and E. S. Lowther, of Guthrie.

Pittsburgh, Penn.—The mining territory formerly covered by the Philadelphia office of the Lidgerwood Mfg. Co. will, after Nov. 1, be handled by W. J. Johnson, sales manager of the Pittsburgh office of the same company.

Charleroi, Penn.—Plans have been drawn for the erection of 400 new coke ovens at the Allicia works of the W. Harry Brown Co. These plans will shortly be put into effect and work on the new ovens is expected to commence within a month.

Welch, W. Va.—The Fire Creek Coal Co. has been organized with a capital of $250,000 and chief works in Raleigh County, West Virginia. The incorporators are Willam Leckie, A. E. Jennings, J. H. Jennings, A. F. Leckie and W. B. Beale, all of Welch, W. Va.

Bellaire, Ohio—The property of the Johnson Coal Co., consisting of a leasehold mine and the machinery and equipment thereof, together with a number of tenement houses, will be sold at public auction by C. W. Dickens, trustee, for cash on Nov. 19.

Welch, W. Va.—The Douglas Coal Co. has been organized with a capital of $150,000 and with principal works in the Dry Fork district of Raleigh County. The incorporators are William Leckie, A. F. Leckie, W. B. Beale, J. H. Williams, A. E. Jennings, all of Welch, W. Va.

Buffalo, N. Y.—Work on the reconstruction of the water coal dock of the Delaware, Lackawanna & Western R.R. Co. has begun, so that the end of the long dispute appears to be in sight. The new dock will replace the old one, being a trifle north of it, as directed by the Secretary of War.

New Orleans, La.—The Cahaba Red Ash Coal Company, of this city, is offering as a stimulation to winter trade a patent coal scuttle, free to every purchaser of a small quantity of Cahaba or lump coal. The company reports that it has distributed hundreds of the scuttles since the advent of cool weather two weeks ago.

.**Henderson, Ky.**—Judgment for $2,000 as damages has been awarded the Keystone Mining Co., of this city against the Louisville & Nashville R.R. in the circuit court. The plaintiff sought damages of $50,000 alleging that the defendant company refused to switch coal loaded at the plaintiff's mine to local manufacturing plants.

Lexington, Ky.—The Kentucky Coal Lands Co., of New York has won its suit in the Federal Court against the General Development Co., of Pennsylvania, which involved the 8-mi. boundary line of an extensive mineral and timber tract in Letcher county. Many thousand dollars worth of land was involved in the case which was on trial for two weeks.

Louisville, Ky.—Coal tonnage on the Louisville Division of the Illinois Central R.R. running into the western Kentucky field, for the month of September was the greatest in the history of the road. The haulage for that month was 298,545 tons of commercial coal. The nearest approach to this record was in October, 1914, when 267,760 tons were hauled.

Pittsburgh, Penn.—The Stauffer Chemical Co., through the Pittsburgh Industrial Development Commission, has taken title to 110 acres of land near Monongahela, Penn., and has 100 additional adjoining acres under option. An option has also been taken on coal land for the purpose of assuring the company of its own fuel supply. These coal lands are in Carroll Township, Washington County.

Columbus, Ohio—Monsarrat Bros., coal operator, with offices in the Hartman Building, Columbus, is planning extensive improvements at its mines, located at Hemlock, Ohio. The property is located on the Zanesville & Western R.R. and now produces 400 tons daily. The output of the property will be enlarged in the near future. The partnership is composed of Nicholas D. Monsarrat and C. R. Monsarrat.

Denver, Colo.—Complaint has been filed with the state public utilities commission charging the Colorado Midland, Midland Terminal and the Cripple Creek & Colorado Springs railways with unreasonable and unjust freight rates on coal shipped to the Cripple Creek district from the mines of the Grand Junction Mining & Fuel Co. and the Palisade Coal & Supply Co. The same companies filed similar complaints a short time ago against the Denver & Rio Grande Ry.

Ashland, Ky.—The Ashland Iron & Mining Co. will shortly start its No. 2 Furnace, closed since December, 1914, and also 72 coke ovens, idle about the same length of time. The furnace will employ 150 men, while 50 to 60 more will find work at the coke ovens. The coal mines of this company are running almost to capacity with a good demand for the product. A new operation was recently opened, shipments from which are just beginning to come in.

Whitesburg, Ky.—Coal operators throughout the Eastern Kentucky territory, including the main Elkhorn and Boone's Fork fields of Letcher County, report an increase of at least 30% since Oct. 1. Railroads, it is reported, have added a number of extra trains and are still pushed to handle the big increase. Thousands of miners are now employed in the mines throughout the eastern Kentucky field. Better prices prevail and operators are optimistic upon conditions.

Grafton, W. Va.—James A. Sincell has been awarded the contract for extensive improvements to be made by the Boat Run Coal Co. These improvements consist of the construction of a half-mile of electric haulage road and the building of two tipples, as well as making two openings and placing the timber in readiness to start work. This work is to be done on a 1,500-acre tract under lease to the company. It is expected that work will be started within two weeks.

Columbus, Ohio—Eastern Ohio coal operators recently asked the Public Utilities Commission to investigate rates of four railroads operating in the eastern portion of the state and to enter an order reducing the rates to a point where they will not be unreasonable and unjustly discriminatory. The petitioners are the Pittsburgh Vein Coal Operators' Association, and the railroads against which complaint is made are the Baltimore & Ohio, Pennsylvania, Wheeling & Lake Erie, and the New York Central.

Harrisburg, Penn.—The Department of Mines has just issued a statement covering the consumption of coal by trade local to the mines in the anthracite region for the period from 1903 to 1913. This statement shows that the increase in consumption has been entirely disproportionate to the increase in population. In 1903 the consumption was 1,373,167 tons, while in 1913 it was 1,943,238 tons. The increase has been gradual, although occasionally the amount would fall behind the previous year on account of a mild winter.

Chicago, Ill.—The property of the Dering Coal Co. of Delaware, situated in Vermillion County, Indiana, and in Fayette Township, Vigo County, Indiana, which was sold last May on foreclosure to Henry Russell Platt of Chicago, has been purchased by the J. K. Dering Coal Co. These properties include the old No. 6 mine near Durkee's Ferry, the old Willow Grove property just west of Clinton, 320 acres about a mile south of Durkee's Ferry and some other isolated tracts. Work will begin at once to sink a shaft at the old No. 6 mine to the 4th seam and the company expects to be taking out coal within 60 days.

Hazard, Ky.—A population of 10,000 is regarded as a probability for this city by next year because of the opening up on an extended scale of the mining field hereabouts. This will represent a growth in two or three years from a town of 300 or 400 people. At this time new plants are being opened up at Buffalo Creek, Glowmaur, Lothair, First Creek and Lennut, while the Louisville & Nashville is finishing work on a branch line into Buffalo Creek and First Creek. About half of the 500 cars of coal which the Louisville & Nashville is delivering daily into Winchester, Ky., comes from the Hazard field. This is soon to be largely increased as the railroad increases its capacity.

Coal Trade Reviews

General Review

Anthracite orders slowing down, but market still firm. Strong upward tendency in bituminous continues. Exports show moderate increase. Lake trade expanding with approaching close of navigation.

Anthracite—A touch of warmer weather has caused a slowing up in orders which has given the retailers a welcome opportunity to catch up on business. The market has not lost ground, but neither has it seen any important additional expansion during the week. Mines are on full-time basis, or as full as the inadequate car and labor supply will permit, and stocks at Tidewater are well cleaned up. Concessions on the circular are still occasionally noted, though prices are generally well maintained, and are notably stiffer than a few weeks ago. The irregular arrivals at the distributing centers are causing considerable confusion. There are still some conservative members of the trade who maintain that there are strong possibilities of a poor winter's business, due to rigid economy among the poorer domestic consumers.

Bituminous—The strong upward tendency continues. The paucity in both the labor and car supply, which is becoming steadily more acute, is the dominating feature of the market. It is noted that some of the steel interests, controlling their own fuel supply, are coming into the market for extra surplus tonnages. Requisitions on contracts are generally at the maximum, and some shippers are beginning to fall behind on their obligations. Prices are up from previous quotations. However, it is clear that competition is still keen for what spot business develops, though a little additional buying power would put the market in a strong position.

Exports.—A moderate increase in export shipments is noted, in spite of the heavy handicap of inadequate vessel tonnage. The pinch of the poor car supply has not been so keenly perceptible on foreign business, the roads giving preference to export tonnages in order to avoid vessel demurrage. Vessel rates have advanced even above the previous prohibitive levels, and tonnage is even more scarce than before with steamers difficult to obtain. Frequent inquiries are received from abroad, but the agencies are beginning to lose interest, feeling that it is scarcely worth while to bid so long as the vessel situation remains so unsatisfactory. Circular prices are nominally maintained at Tidewater, but good orders for prompt movement would no doubt shake out some concessions.

Lake Markets—The steady improvement continues, though conservative observers are inclined to regard the situation as abnormal in view of the fact that it is built up primarily on large war orders. However, it is undoubtedly a fact that there is a persistent expansion in manufacturing that is causing a steady increase in the coal consumption. The Lake trade is rather more active, and indications point to a rush of fair proportions over the closing period in spite of the growing scarcity of vessel tonnage. The return of milder weather conditions has caused a slowing up in domestic business which is falling somewhat behind expectations, but constructive factors predominate in the market generally, and colder weather gives indications of rush orders in the very near future. Prices on all grades are stronger, operators already well covered having advanced quotations sharply.

Middle West—The appearance of a period of relatively warm weather has brought some pressure on the domestic market, though the demand continues well distributed. Full circular prices rule generally, and there is no consignment coal on the market. Surpluses are well cleaned up, while the railroads continue absorbing a good tonnage and the market has not lost ground by any means. The higher temperatures have not seriously affected shipments out from the upper Lake ports; the movement for September showed a gratifying increase over the same month last year, but receipts are falling behind because of attractive offers made vessel owners for grain and iron charters.

A Year Ago—Cold snap starts the retail anthracite trade moving, but the mines continue short of orders. Bituminous outlook pessimistic. Cancellations the rule, and mines are reducing working schedules.

BUSINESS OPINIONS

Iron Age—Despite efforts of the larger steel companies to hold the demand in check, signs of a runaway steel market are increasing. They report orders coming in at such an enormous rate that all of them are being carefully considered before being accepted. On some classes of material it is a question of getting deliveries and not prices. This month will establish new records in the output of iron and steel, but in spite of the huge production the mills are getting farther back in deliveries. The extraordinary demand for open-hearth steel is bringing about conditions which prevailed several years ago under similar conditions.

Bradstreet—Save for a probably temporary setback to retail distribution caused by a spell of warm weather, progress in trade and industry continues of conspicuous proportions, with even greater gains apparently in store. In the larger lines cumulative expansion is the chief characteristic; retail merchants show a stronger propensity to buy ahead; the steel trade goes on making ground; prices on some finished products have been advanced, partly to keep buying within certain bounds; the long predicted scarcity of railway cars is an actual fact and a paucity of labor exists.

Marshall Field & Co.—Current wholesale distribution of dry goods continues to show a healthy gain over the corresponding period of a year ago. Mail orders and road sales are heavy for immediate delivery. Customers continue to be in the market in much larger numbers. Collections are above normal. The advancing prices in many lines of cotton, wool and silk goods reflect the firmness and upward tendency of prices in primary markets.

Boston News Bureau—The best evidence of business improvement is the glutted condition of some of the railroads. Western dispatches say that there are now more loaded freight cars standing still on the side tracks waiting to be moved than at any time in years. Atchison's loadings, for instance, are breaking all records. Without question, however, the feature of supreme moment is the continued demoralization of foreign exchange. Neither the $500,000,000 Anglo-French loan nor the liquidation of American held stocks for English account have been sufficient to hold up sterling exchange. The fact is New York is fast becoming the money center of the world. The flow of capital is in that direction.

Southern Lumberman—Reasons for the further advances in prices obtained for yellow pine lumber are not hard to find. Reports are uniformly to the effect that the demand is rapidly and steadily increasing. Railroads continue to buy, and in larger quantities. Rush orders are being received from retail dealers with such frequency as to cause wholesalers much concern about prompt delivery, and a number of mills in Mississippi-Louisiana territory are reported as turning down orders, particularly for rough stock. Car builders and implement manufacturers are also placing orders, and there is a heavy inquiry from the East. Shipment of 16 mills for the month of September shows that 418,388,705 ft. were produced in September, as against 384,590,700 ft. in August.

Dun—Even the change to milder weather did not materially lessen retail demands, and there are still many more points of gain than of loss in the general situation. This fact is made clear in reports from the principal centers, as well as by the various statistical gauges that measure business movements and volumes. Bank clearings outside of New York largely surpass those of recent years, gross railroad earnings are steadily rising, the upward trend of commodity prices is unchecked and the increase in commercial borrowing gives additional proof of trade expansion. Evidence of widening activity is apparent in nearly every important department and in localities where no sign of it was manifest a short time ago. Progress is more rapid, as it should be, in the industrial than in the trading field, and is most pronounced at cities where the manufacture of war supplies is now the leading occupation.

ATLANTIC SEABOARD

BOSTON

Spot market quiet, but contract demand active on Pocahontas and New River. Prices not as firm as were expected. Low prices on cars are in prospect for 1916. Georges Creek easy, but quality grades from Pennsylvania are active. Anthracite trade favorable.

Bituminous—The Hampton Roads coals are generally firm at $2.80@2.85, but this week has shown there are still some soft spots in the market. Two or three small orders for delivery the next 60 days have been closed on an alongside basis that is understood to net not over $2.75 f.o.b. and probably 5c. less. Spot business is so extremely quiet that all the agencies get into the competition when inquiry is made. Contract demand is good, enough newspaper comment on the possibility of car and labor shortage having reached New England buyers to make them actively interested in getting supplies forward. Export trade is also in good shape for the moment. The whole situation is just at the point where a little buying power would induce a near active market on Pocahontas and New River.

So far, Georges Creek is in sufficient supply to fill current orders, although the shippers are requiring somewhat longer notice than has lately been usual. They were, however, successful competitors for one of the few contracts that has come up during the week, and doubtless spot business is as attractive to them as to the shippers farther south.

Several of the Pennsylvania coals are really enjoying an active market. Some of the Cambrias have advanced 10c. since last reports and in a few cases are declining new business, particularly that which calls for delivery through the winter. Reports of labor shortage from some districts are almost alarming and apparently an increasing number of operators are conservative in their commitments from now on. The Somerset grades seem to be less affected thus far, though that region is usually among the first to feel any scarcity of cars. All the quality coals are now active, more of the consumers being reached all-rail and therefore more sensitive to rumors of slow movement. The last fortnight there has been a lot of doubling up on usual contract requirements and operators in many cases find themselves unable to take advantage of the small premiums that are now being offered for delivery from now to April.

Water Freights are also hardening a little on account of the increased contract demand; 85c. is the current quotation on boats of 2,500 tons upward, Hampton Roads to Boston. Long Island Sound barges are also in better demand, as high as 55c. having been paid lately from New York to New Bedford.

Anthracite trade is good in all directions. The weather has turned colder and retail demand is much improved. At the same time the companies are not discouraging new business and in most cases are very little behind on their orders.

Bituminous quotations, f.o.b. loading ports at points designated, are about as follows per gross ton:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields	$2.25@2.75	$2.55@3.00	....	$0.95@1.50
Cambrias and Somersets	2.45@2.95	2.70@3.20	....	1.20@1.65
Georges Creek	2.92@3.02	3.22@3.32	$2.85@2.95	1.67@1.77

Pocahontas and New River prices, on cars Boston, are $3.50@3.73; Providence, $3.50@3.68; and f.o.b. loading port at Hampton Roads, $2.80@2.85.

NEW YORK

Anthracite market active. Mines feeling car shortage. Tidewater situation improving. Steam coals stronger. Bituminous demand increasing. Prices advance and car supply bad.

Anthracite—There is considerable activity in the anthracite market. Present conditions are exceedingly healthy and the prospects for a continuation of same are bright. The mines continue to work full time whenever sufficient cars are available but even at that operators are unable to get out sufficient coal to meet requirements owing to labor scarcity. Some independent operators have enough orders on hand to keep them busy for the next month or six weeks. Shipments to the West are restricted owing to lack of box cars while scarcity of the small cars hinder shipments East.

Of the large sizes egg is weaker than stove or chestnut and occasional stray cargoes have sold at $5.20. Stove and nut are strong and there were reports that some shippers had secured premiums for the choice grades for quick delivery.

The steam size situation is becoming stronger. Pea is commanding full companies' circular and sometimes better. The poorer grades of No. 1 buckwheat were quoted during the week at $2.50 but the better coals are bringing the full circular.

Quotations, f.o.b. New York harbor, gross tons, are:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$5.20@5.30	5.35	$5.25@5.35
Stove	5.30	5.20@5.30	5.35	5.25@5.35
Chestnut	5.55	5.40@5.55	5.60	5.50@5.60
Pea	3.50	3.25@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.25@2.75	2.80	2.25@2.80
Rice	2.25	1.85@2.25	2.30	2.00@2.30
Barley	1.75	1.50@1.75	1.80	1.75@1.80

Bituminous—Demand is on the increase and the Tidewater situation shows much activity. The demand has showed much strength and there has been a corresponding increase in prices. While there has been no evidence of a lack of supply as yet the scarcity of labor and shortage of cars are tending to bring about this condition. Many middle houses have had their representatives in the coal fields during the past week.

Loading docks in the harbor have small stocks and shippers find a ready market. Contract holders are taking their full quota and there is very little of the high-grade coals left for the spot market. Some shippers were greatly worried the early part of the week by the report that certain of the railroads entering New York were about to place an embargo on shipments. It was not expected however that this order would affect coal shipments.

Shortage of bottoms is striking hard at the export business but bunker demand continues heavy.

The cheaper grades of coal at tidewater are about 35c. higher than last week and some sellers are advising quick buying at those figures, as next week may see still higher prices. With the possible exception of George's Creek coals all grades have advanced from five to ten cents per ton.

Current quotations on various grades, f.o.b. New York harbor, gross tons, follow:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85
Georges Creek Tyson	2.95@3.00	2.95@3.00	2.95@3.00	1.40@1.45
Clearfield:				
Medium	2.80@2.85	2.80@2.85	....	1.25@1.35
Ordinary	2.75@2.80	2.75@2.80	....	1.20@1.25
Broad Top Mountain				1.25@1.45
Cambria County:				
South Forks	3.05@3.10	....	....	1.50@1.60
Nanty Glo	2.90@3.00	....	....	1.35@1.45
Barnesboro	2.85@2.90	....	....	1.30@1.35
Somerset County:				
Quemahoning	....	2.90@3.00	2.90@3.00	1.35@1.45
Medium	2.80@2.90	2.80@2.90	2.80@2.90	1.25@1.35
Latrobe	2.70@2.75	....	....	1.15@1.20
Greensburg	2.90@3.00	....	....	1.25@1.35
Westmoreland	3.20@3.30	....	....	1.45@1.55
West Virginia Fairmont ¾		2.70@2.80	2.70@2.80	90@1.10
Fairmont mine-run		2.70@2.75	2.70@2.75	.90@1.00
Steam		2.70@2.80	2.70@2.80	1.15@1.25
Western Maryland		2.70@2.80	2.70@2.80	1.15@1.25

PHILADELPHIA

Anthracite slowed up by the weather, but quickly recovered on return of seasonable conditions. Production large. Car supply short. Pea and stove lead the sizes and chestnut slow, but slightly firmer. Bituminous had fair week; slight price increases, especially Fairmont. Exports somewhat better but vessels scarce.

Anthracite—The week started in badly due to a return to summer weather which caused considerable holding up of orders by the retailers. However, retailers have had an opportunity to catch up with orders, many of them having been badly behind in this respect. The latter part of the week again turned cold so that the wholesale trade resumed its former briskness and the week can well be counted as a good one. All signs point to a busy market.

Low prices are the chief source of trouble to the dealers, rather than a lack of business. The cut-rate war rages and this week it extended to the north-west part of the city. Every dealer blames his neighbor and for the present an adjustment appears hopeless. The fight will probably continue until coal becomes scarce and in the meantime many of the householders appear to be taking advantage of the unusual prices and at the same time fortifying themselves against a probable suspension.

Broken is well taken care of while chestnut is still draggy but with quotations moderately firm. Egg shows little improvement and sales were recorded the past week at from thirty to forty cents off circular; one sale of 600 tons was made at $3.35, which is 40c. less than the circular. The individuals do not seem to be able to move it fast enough, even at cut rates, to avoid car demurrage at the mines. Stove and pea continue the leaders. The latter size is especially active and the dealers have moved more of it than any other size. Still the price does not advance, much to the chagrin of the individuals who appear to be most anxious to make up their losses. There is certain to be an adjustment in the price of this size, though not at any time soon.

Buckwheat continues steady, and at times even scarce, while rice cannot find a market. Some of the larger companies are bringing large quantities of rice into the city and storing it at convenient points.

The prevailing prices f.o.b. cars at mines and at Port Richmond, per gross ton are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.25	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—While many agencies report a good tonnage there are some who claim that shipments have been no better than the average, but even the offices of these concerns present a brisk appearance in their efforts to get the orders off the books. This is due to the difficulty in getting cars which is particularly felt in the Fairmont region where prices have been forced up. As a matter of fact the upward tendency in all grades continues to some extent. There has been a little more activity in the export trade; shippers continue to get frequent inquiries for foreign shipment, yet many feel it is a waste of energy to make quotations owing to the lack of vessel tonnage. At the present time most boats usually in the coal trade are carrying grain, oil and war munitions at very high rates.

The following are average prices prevailing, per gross ton:

Georges Creek Big Vein	$1.70@1.80	Fairmont gas, ¾	$1.30@1.45
South Fork Miller Vein	1.55@1.65	Fairmont gas, mine-run	1.15@1.25
Clearfield (ordinary)	1.20@1.30	Fairmont gas, slack	.85@ .90
Somerset (ordinary)	1.15@1.25	Fairmont lump, ordinary	1.10@1.20
West Va. Freeport	1.00@1.10	Fairmont mine-run	.95@1.05
		Fairmont slack	.85@ .90

BALTIMORE

Market grows steadily tighter under the restrictions of a poor labor supply and inadequate car movement. Export trade shows an improvement. Anthracite men busy.

Nearly everybody seems to want coal now that so little is available above that moved on contract obligations. Most of the producers and shippers are considerably behind on contracts.

In most of the mining districts of West Virginia, Pennsylvania and Maryland the past week the railroads were far behind in the car supply. Because of a number of recent vessels reporting here, both the Baltimore & Ohio and Western Maryland were giving some preferential treatment toward getting coal here to save ship demurrage. The result was an increase in the export movement over several weeks past. During the week just closed a total movement of 32,635 tons was recorded for foreign ports.

Anthracite dealers are quite busy. Supplies so far have been sufficient despite car shortage.

The following are prices quoted, although some coals are practically if not entirely out of the market:

	Mines	Balt.*	Fairmont	Mines	Balt.*
Geo. Crk. Big Vein	$1.80	$2.98	Ordinary mine run	$0.90	$2.28
Geo. Crk. Tyson	1.50	2.68	Ordinary ¾	1.00	2.43
Clearfield	1.30	2.48	Ordinary slack	.75@ .80	2.08
South Fork	1.45	2.63	Low sulphur mine-run	1.20	2.63
Latrobe	1.10	2.18	Low sulphur ¾	1.30	2.73
Somerset (best)	1.45	2.63	Low sulphur slack	.85	2.23
Somerset (good)	1.25	2.43			
Quemahoning	1.35	2.53			
Freeport	1.00	2.08			
Miller Vein	1.25	2.33			

* F. o. b., outside Capes.

HAMPTON ROADS

Movement for week somewhat light. Fair surplus at Tidewater.

Dumpings for the week continued light as compared with those of a few weeks back. The demand has been light on all grades both in the wholesale and retail market. The continued warm weather is having its effect on domestic dealers who are reporting but a small percentage of the usual sales for this time of the year.

Regular circular prices are still being quoted on coastwise and export coals while domestic grades are retailing at from $7.50 for anthracite to $5.50 for lump, egg and splints. There is a fair surplus of free coal at Tidewater and while shippers will not quote below the usual circular price an order for prompt movement could probably be filled at somewhat below circular.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

	Week Ending				
Railroad	Sept. 27	Oct. 2	Oct. 9	Oct. 16	Oct. 23
Norfolk & Western	163,400	131,055	140,934	145,236	163,920
Chesapeake & Ohio	91,341	72,996	93,344	66,361	81,517
Virginian	79,176	59,997	65,150	54,964	51,304
Totals	333,917	264,048	299,428	266,561	296,741

OCEAN FREIGHTS

The freight market is much firmer than a week ago, and is still advancing; new high levels are being reached on time charters in grain and other trades. Tonnage is very scarce and steamers difficult to obtain; none of the few steamers that have been chartered for export coal, since our report was issued, have been reported.

We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana	$2 50@2 75	Bermuda	$3 00@ 3.25
Cardenas or Sagua	2.75@3.25	Vera Cruz	4 75@ 5.00
Cienfuegos	3.00@3.50	Tampico	4 75@ 5.00
Port au Spain, Trinidad	3.75@4.00	Rio	9.60@10.32
St. Lucia	3.75@4.00	Santos	9.84@10.56
St. Thomas	3 25@3.50	Montevideo	9.60@10.80
Barbados	3.75@4.00	Buenos Aires or La Plata	9.60@10.80
Kingston	3 00@3.25	Rosario	10.80@12.00
Curacao	**3.50**	West Coast of Italy	15.60@16.80
Santiago	3 25@3.50	Barcelona	13.20@15.60
Guantanamo	3 25@3.50	Valparaiso or Callao	7.50
Demerara	5.50@6.00	Marseilles	14.40@15.60

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Labor supply growing scant. Car shortages exercise important influence. Considerable export movement. Prompt prices about 5c. higher.

Labor supply has become still more a factor in coal trade. Not much difficulty has been experienced as yet in the Pittsburgh coal district, but the Connellsville region is distinctly short of men and it is claimed more ovens could be put in blast, with a market for their product, if men could be gathered. Some of the Pittsburgh district mines are a trifle short of men. At present car shortages are more important than labor shortages. At many of the mines operations are being governed wholly by the car supply and while fair outputs are obtained on an average the operation is quite irregular; operations average 70 to 75% of capacity.

The demand for coal for export both to Canada and through the Seaboard is increasing. Considerable mystery has attached to the coal export movement for months and a larger tonnage is doubtless going out than is generally reported. Indeed it appears that in some instances the business has been so handled that the coal operators themselves do not know that their coal is going into export channels. The market has undoubtedly stiffened in the past week or ten days and with no great change in the demand for local use the stiffening may perhaps rightly be attributed to export demand.

There is a little larger movement to retail dealers while the railroads are taking somewhat more coal. The iron and steel industry had already reached its maximum possible consumption, though there may be some stocking in the next few weeks. We quote free coal generally about 5c. higher, with Youghiogheny gas slack strong at 75c. and steam slack at a spread below, prices being in general as follows: Free coal: Slack, 60@75c.; nut and slack, $1@1.05; nut, $1.05@1.10; mine-run, $1.10@1.15; ¾-in., $1.20@1.25; 1¼-in., $1.25@1.30; on contract to Apr. 1. Slack, 85@95c.; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

BUFFALO

Market strong but not booming. Prospect of greater activtiy later. Many reports of car shortage. Some roads short of low-sided cars for the first time.

Bituminous—The former steady improvement continues. However, close observers say that home business is not yet up to the normal and except for the business that hinges on the war, the general volume would not be large. It is the export trade and the war orders that keep up our activity.

Still the condition of the railroads shows that an enormous volume of business is being done. Certain Pennsylvania roads are short of gondola cars for the first time in their history. The grain trade is taxing all roads in this vicinity to provide adequate motive power and that reduces their capacity for moving coal. There is not much complaint of coal on track unsold, but the mines would flood all markets if they could get the cars. It is impossible to get sufficient cars for more than a fair increase of output.

Bituminous prices grow stronger each week, though it is noted that certain Pennsylvania companies, are accused of putting out fictitious prices to stave off orders. Following are representative figures:

	Pittsburgh	Allegheny Valley	Penn. Smokeless
Lump	$2.65	$2.45	$2.55
Three-quarter	2.55	2.35	....
Mine-run	2.45	2.25	2.30
Slack	2.25	2.15	2.30

Prices are f.o.b. per short ton to Buffalo and Rochester points and per long ton east of Rochester.

Anthracite—The trade increases steadily, but has hardly reached the normal mid-autumn volume, on account of the mild weather. The demand will come with a rush after awhile, but there is a growing idea that it is not going to be enough to offset the dullness that prevailed all summer. It is noted that a great many families are doubling up for the winter to save fuel, especially in Canada, where business in much duller than it is here. Shippers of independent anthracite report some premiums received, but this is only in special cases. Prices are about on a par with the circular, as follows, per long ton, f.o.b. Buffalo: $5.60 for grate, $5.85 for egg and stove, $6.10 for chestnut, $4.30 for pea, $3.25 for buckwheat, $2.75 for rice, $2.50 for barley, and $2.25 for screenings, with 25c. extra for delivering on Lake vessel. Lake shipments for the week were 104,000 tons.

TORONTO, CAN.

Anthracite fair. Bituminous slow except on slack which is strong. Car supply short.

Anthracite for domestic purposes is in fair demand, but bituminous is not moving so freely. The principal feature of the market is the scarcity of slack, owing to the shortage of cars, which is holding back deliveries. The wholesale price of slack has advanced and is likely to go higher unless transportation conditions improve. There are abundant supplies of other grades in stock, as dealers are anxious to provide against a shortage. Quotations per short ton, for best grades, are as follows: Retail anthracite, egg, stove and nut, $7.75; grate, $7.50; pea, $6.50. Bituminous retail steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $8. Wholesale f.o.b. cars at destination, three-quarter lump, $3.79; screenings, $3.15.

COLUMBUS

Continued improvement in the Ohio trade. Steam trade is stronger and domestic demand holding up well despite the warmer weather. Prices strong all along the line.

Strength is still the chief characteristic of the coal trade in Ohio. With the continued expansion in manufacturing, there is a stronger demand for steam grades and despite the warmer weather there is also a steady call for domestic sizes. Strength is shown in the price list on all grades.

Iron and steel manufacturing is decidedly on the upturn and this is reflected on the coal trade to a marked degree. Manufacturing in other lines is also better and fuel requisitions are gradually increasing. Purchasing agents are showing a disposition to buy for the future and orders for shipment in November and December are noted. Railroads have about concluded stocking operations, although there is still a good demand for railroad fuel in certain sections. Contracting for steam tonnage is rather active.

Retail trade has been good in spite of the unfavorable weather conditions. Dealers have been busy making deliveries and householders are now in the market for considerable stocks. Retail prices are strong and there are indications of an advance some time after Nov. 1. Dealers stocks are light. Coke is stronger and the same is true of anthracite.

The Lake trade is still active and there are indications of a rush from this time to the close of navigation. Bottoms have been chartered until insurance is off and very few empties are available. Dock prices are unchanged.

One of the worst features is the growing car shortage which is interfering with shipments.

Prices in Ohio fields per short ton, f.o.b. mines, are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.60	$1.65		
Inch and a quarter	1.50	1.50	$1.35	$1.50
Three-quarter inch	1.35	1.40		1.35
Nut	1.25	1.30		1.25
Mine-run	1.15	1.20	1.05	1.10
Nut, pea and slack	.70	.75	.55	.60
Coarse slack	.60	.65	.45	.50

Mines have been working at about the following percentages of full capacity:

District	Week Ended				District	Week Ended			
	Oct. 2	Oct. 9	Oct. 16	Oct. 23		Oct. 2	Oct. 9	Oct. 16	Oct. 23
Hocking	50	50	55	60	Cambridge	45	50	60	60
Jackson	25	30	40	60	Massillon	45	55	60	45
Pomeroy	80	75	85	65	Eastern O.	80	80	85	85
Crooksville	40	45	50	85					
					Average	52	55	62	65

CLEVELAND

Warm weather has cut deeply into the immediate demand. Market rather soft at the opening of the week. Receipts light.

Domestic coal was at a low point Monday when Pocahontas lump and egg were sold on track here at $3.50 and mine-run at $2.75. These prices were due entirely to a warm day that prevented dealers selling domestic coal. Prices being asked by Fairmont operators are prohibitive so far as the local market is concerned and one or two jobbers who sold short are having considerable trouble covering at a price that will let them out.

Between 250 and 300 cars were received over Sunday, but the warm weather reduced the demand for coal as heating plants were not fired or, if they were, they were using the minimum amount of fuel. There was no sign of price cutting except on domestic fuel, the steam grades being a safe proposition to hold for a few days.

The Lake trade shows very little change. The car shortage is preventing much increase in shipping and orders from the Northwest are not pressing.

Jobbers are being quoted at the following prices f.o.b. Cleveland per short ton:

	Poca-hontas	Youghio-gheny	Fair-mont	Berg-holz	Ohio No. 8
Freight rate......	$1.45	$1.00	$1.15	$0.70	$0.90
Lump	3.60				
Lump, 6-in........				2.30	
Lump, 1¼-in.		2.40		2.10	2.15
Lump, ¾-in......		2.30	2.15	2.00	1.95
Egg..............	3.60				
Egg, 6-in				1.90	
Mine run.........	2.75	2.15	2.05	1.85@1.90	1.85
Slack............		1.80@1.85	2.00	1.65	1.65@1.70

DETROIT

Steam coal buying is steady. Demand for domestic sizes weak. Anthracite active. Lake movement still below normal.

Bituminous—Growth of business in various manufacturing lines is creating a broader market for steam coal. Orders continue mostly for small tonnage, but the business is expanding into a steady demand and regular buying, with fine coal especially active. Domestic demand has not been up to expectations, due to continued high temperatures.

Prices are in most instances maintained at close to the circular. For Hocking domestic lump, the mine price per short ton is about $1.50, with three-quarter lump at $1.25 and the mine-run at about $1. Jackson Hill domestic lump is $2.50; West Virginia gas three-quarter lump, $1; mine-run, 90c.; slack, 75c.; splint three-quarter lump, $1.10; slack, 60c.; mine-run, 85c.; Kentucky splint lump, $1.65; Pittsburgh No. 8 three-quarter lump, $1.10; smokeless lump and egg, $2.25; nut, $1.75, and mine-run, $1.40.

Very little difficulty is now reported from consignment stock, though sales of lump and egg sizes are made occasionally below list to clear tracks.

Anthracite—Retail dealers are having a satisfactory business. Stocks, however, are holding out well and they are still cautious in giving renewal orders. Delivery is being delayed by car shortage in the mining regions.

Lake Trade—Bituminous shipments are not up to those of previous seasons and are being handled very largely by vessels carrying iron ore down. The movement of hard coal is about normal. Reports from the Canadian and American head of the lakes denote larger shipments are being made from unloading docks to consuming points.

TOLEDO

Lake coal moving as navigation season draws near, close. Steam trade improved.

The market continues rather colorless. There has been quite a movement of Lake coal and the docks are fairly well loaded as the navigation season draws nearer to a close. Steam trade here is improved, due partially to the heavier operation of many factories and also to the improved situation on the railroads. Nut, pea and slack are in unusually good demand. Domestic coal is not as active as might be expected owing to the recent mild weather. Prices are unchanged as follows:

	Poca-hon-tas	West Virginia	Hock-ing	Pom-eroy	Jack-son	Mass-illon	Ken-tucky	Pitts-burgh No. 8
Lump......	$2.25	$1.40@1.85	$1.60	$1.65	$2.50	$2.50	$1.75	$1.25
Egg........	2.25	1.00@1.25	....	....	....	....	1.25	1.20
Mine-run...	1.40	.85@1.00	1.10	1.10	2.50	....	.90@1.10	1.00
Nut........	....	.90@1.15	1.25	1.25	....	2.50	.90@1.15	.....
Nut, pea and slack.	....	....	.65	.65	.60	....	.40@ .60	.60@.75

CINCINNATI

Labor and car shortage and improving demand the dominate features. Prices stiffening. Orders difficult to handle.

Continuance of constructive factors has stimulated the market materially and there is a rather noticeable shortage even with the comparatively small demand. While the weather has not yet been severe, there has been plenty of frost at night, which has served to bring consumers into the market for heating fuel. The continued improvement in the industrial situation, led by the steel and machinery trades, is expected to develop a normal demand for steam coal all through the winter, and all that the trade now needs is a sufficient supply of rolling stock and labor.

COKE

CONNELLSVILLE

Sharp advance in prompt furnace coke continues. Efforts to start additional ovens encounter labor scarcity. Foundry coke likewise higher. Production and shipments slightly increased.

The scarcity of spot furnace coke has become more pronounced and higher and higher prices have been bid, reports having it that $2.75 has already been paid in several instances, though bids at this writing are usually about $2.60. There has been an advance of nearly 50c. in a week and of fully 75c. in two weeks. Operators have been making strenuous efforts to get additional ovens into blast since this sharply advancing movement started, but have met with indifferent success, on account of the shortage of men. The Republic Iron & Steel Co., which was buying for a while at the rate of perhaps 2,000 tons a day, is said to require outside coke still as its additional 75 byproduct ovens are only being put in blast this week and it may be some time before their full output is realized, while the company's beehive plant in the Connellsville region was recently closed, to ship coal to the new plant.

Negotiations on furnace coke contracts are somewhat disturbed by the advance in prompt coke as operators are disposed to hold out now for higher prices. Foundry coke has stiffened sharply, for with fairly remunerative prices offered for furnace coke there is a disposition on the part of some operators to give less attention to the foundry coke trade. As high as $2.85 has been paid on carload lots of spot foundry in the case of the best brands. When contracts were made last May and June the operators were disposed to restrict the period to six months instead of the usual twelvemonth, and it is expected considerable contract demand will now develop for the first six months of next year. We quote: Spot furnace, $2.60@2.75; contract furnace, $2.25@2.50; spot foundry, $2.60@2.85; contract foundry, $2.60@2.85, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 16 at 421,091 tons, an increase of 3,367 tons, and shipments at 422,645 tons, an increase of 4,567 tons.

Buffalo—The prices on all grades of coke are strong. It is found so hard to obtain all the cars required that the actual demand cannot be supplied at all readily. The consumption increases steadily and promises to continue so for sometime yet. Most producers have withdrawn all quotations, but local jobbers still quote best 72-hr. Connellsville foundry at $4.40 and stock coke at $3.45.

New York—Prices for coke took a jump during the week and quotations for foundry coke were at $3 subject to quick acceptance.

Chicago—Furnace and foundry coke are still in a strong position. Orders for foundry coke have shown further gains. Domestic sizes are easier due to weather influences. Prices per net ton f.o.b. cars Chicago are as follows: Byproduct foundry, $5@5.25; byproduct domestic, $4.65@4.90; Connellsville, $4.85@5; Wise County, $4.85@5; gas coke, $3.90@4.15.

MIDDLE WESTERN

GENERAL REVIEW

Car shortages prevalent. Warm weather causes slackening in domestic orders. All bituminous prices firm. Anthracite active. Mines still behind orders. Screenings stronger.

Notwithstanding the continuance of warmer weather, which has prevented domestic coals from developing as rapidly as expected, remarkable strength is noted in the trade and the demand is well distributed on all grades. An increasing slowness in the movement, due apparently to car shortages, is causing many retailers considerable anxiety. Most country retailers are reported to be taking but little stock in the possibility of a miners' strike next spring.

It is difficult to buy any large quantities of the coarser sizes without paying full circular prices. No consignment coal is on the market. Current domestic shipments from the mines are all being made within the limits of price schedules, and what slight concessions are made apply only to shipments for the Chicago district. Some of the western railroads are finding difficulty in providing enough cars to load their contract orders.

Buying of steam coals is confined mostly in small quantities, though orders are so frequently renewed that the aggregate tonnage is considerably more than at any time since last winter. Western screenings have advanced 5c. to 10c. per ton and operators are receiving two to three times as much revenue for fine coal as they did at this time last year. Some Illinois operators are considering storing screenings on the ground if the demand continues below production.

CHICAGO

Mild weather causes a slowing up, but the market has not lost ground. No Eastern coals offered and some shippers behind on their contracts. Car and labor supply short. Anthracite active.

Shipments of all grades from Franklin County are keeping up at a steady rate. A slight recession has occurred in the domestic ordering due to warmer weather, but screenings and other steam coals are strong. Some heavy sales of Southern Illinois screenings for storage purposes have been made. Saline County screenings are exceptionally strong. Carterville mines have had poor car supply, some of the mines being closed down for one or two days.

Springfield district coals show little change. Screenings are averaging from 40c. to 50c. per ton, and domestic sizes have been well maintained in the face of the higher temperatures.

The Indiana domestic demand has slowed up somewhat. With the advent of cold weather again the retail trade will probably be in full swing, so that a great many dealers are piling up stocks. Buying of Indiana steam coals continues on a hand to mouth basis, and very few manufacturers have laid in a supply for winter use.

The small sizes of Hocking coal are eagerly sought Steam business is quite brisk, and the Lake trade is reported still active and is expected to continue so until the close of navigation.

Kentucky prices are firm. The car supply has become quite a problem and some of the mines have only been able to operate half time; a number of mines are behind on their contracts from a week to ten days, and the car and labor situation shows no prospect of improvement. It is confidently expected therefore that much higher prices will prevail for Kentucky production very shortly.

Anthracite demand is brisk, with a satisfactory increase in both mail and wire orders. Dealers report delayed movement and orders from far Western points are arriving in increasing numbers. Improvement in distribution is quite pronounced.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.
Lump	$1.75@1.85	$1.50@1.65	$1.50@1.70	$1.35@1.50	$1.40@1.60
Steam lump	....	1.20@1.30	1.15@1.30	1.25@1.30	....
2½ and 3-in. lump	....	..	1.40@1.50	1.15@1.25	1.30@1.45

DULUTH

Gradual and steady increase in shipments of commercial coal. Receipts light.

Shipments of the past week are fully up to the average, although the mild weather has curtailed retail business to a certain extent. Shipments for September amounted to 24,712 cars as compared with 24,347 cars for the same month last year, an increase of 365 cars over 1914 and 678 cars for the same month in 1913. These figures would indicate a gradual and steady improvement and the various managers of the dock companies are optimistic as to the future.

Receipts continue light, the vessel owners and managers find it more profitable to ship grain at the present rates, than to carry coal. Quotations per short ton, f.o.b. cars Duluth are as follows:

	Yough.	Splint	Hock.	Smokeless	Elkhorn
Lump	$3.40	$3.40	$3.40	$4.75	$3.75
Dock-run	3.10	3.10	3.05	3.25	3.25
Stove or nut	3.40	3.40	3.40	4.75	3.65
Screenings	2.40	2.40	2.25	2.75	2.40

The mild weather throughout this territory during the last ten days has caused quite a shrinkage in the shipments of anthracite, the retailers finding it impossible to induce their customers to stock up. However, it only remains for a few days of cold weather to start a regular buying boom in this commodity. Quotations f.o.b. cars per short ton, are as follows: Egg and stove, $6.85; nut, $7.10; pea, $5.55, and buckwheat, $4.

ST. LOUIS

Mild weather slows down the market. Screenings in good demand. Over-production of Standard grades.

The persistent fair and fine weather has caused a continuance of stagnant market conditions. There was only a light movement and that was mostly in the left-over output of the week before, when there was a touch of winter. Price changes were slight. The week closed with Williamson and Franklin County screenings short and tightening up and Standard and Staunton heavy on account of recent over-production.

Quotations f.o.b. mines during the past week have ranged on following basis per short ton:

	Frk. Co.	Wmsn. Co.	Staunton	Standard
6-in. lump	$1.50@1.75	$1.50@1.75	$1.25@1.35	$1.20@1.25
2-in. lump	......	......	1.15@1.20	1.10
3x6 egg	1.40@1.75	1.40@1.65	......	1.00
2x6 egg	......	......	......	.80@.85
No. 1 nut	1.50@1.75	1.50@1.75	......	.80
No. 2 nut	1.40@1.50	1.40@1.50	....	.55
No. 1 washed	......	1.65	1.50	....
No. 2 washed	......	1.25	1.10@1.25	....
No. 3 washed	......	1.25	1.10@1.25	...
No. 4 washed	......	1.20	1.05	
No. 5 washed	......	.60@.70	.50@.60	....
Screenings	.40@.50	.40@.50	.20@.25	.20@.25

Freight rates—Inner group, St. Louis 57½c., East St. Louis 37½c. Outer group, St. Louis 72½c., East St. Louis 52½c.

INDIANAPOLIS.

Indiana mines on about normal schedule. Railroads good buyers and industrial situation improved. Prices generally unchanged. Minimum quotation for screenings 55c. f.o.b. mines.

The weather has been too warm for a further improvement in the better conditions that have been prevailing recently, but the market has held its own. While the mines are not up to their maximum winter schedules, they are probably within 25% of it in the chief fields. The larger companies report that their surplus coal is well cleaned up notwithstanding the slackening in demand due to the higher temperatures.

Fair prices for slack are still obtainable, 55c. seeming to be the bottom for Nos. 5 and 6. The demand for No. 4 from gas producing plants and other users of high quality screenings is such as to maintain the price at 80c. Railroads continue to be good buyers and coal operators believe this is an indication that roads see better times ahead. They are still able to supply cars enough to meet current requirements, but there is considerable talk about a car shortage generally.

PRODUCTION AND TRANSPORTATION STATISTICS

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for September of the current year and the nine months of 1914 and 1915, in short tons:

	September 1915	September 1914	Nine Months 1915	Nine Months 1914
Anthracite	783,307	983,442	7,603,051	8,020,105
Bituminous	3,901,402	4,050,102	31,678,900	33,864,642
Coke	1,152,668	733,479	8,378,576	7,561,858
Total	5,837,377	5,767,023	47,660,527	49,446,605

FOREIGN MARKETS

GREAT BRITAIN

Oct. 15—There is no improvement in the general position of steam coals, which are weak for all descriptions, owing to the lack of ready steamers. Quotations are nominally as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$5.76
Best seconds	Nominal	Seconds	4.32
Seconds	$5.76	Best Cardiff smalls	4.08
Best dry coals	6.96	Cargo smalls	1.92

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is on restricted lines especially for the Mediterranean. Tonnage is still scarce and rates are strongly maintained. Rates are approximately as follows:

Gibraltar	$6.72	Naples	$9.60	St. Vincent	$9.12
Marseilles	8.68	Alexandria	10.80	River Plate	11.44
Algiers	8.10	Port Said	10.80		
Genoa	9.60	Las Palmas	7.92		

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
1485	Rock Falls Elec. Lt. Plant	Rock Falls	Ill.	1,800b	576
1487	Carnahan Tin Plate Co.	Canton	Ohio	24,000b	576
1498	Fall City Brewery	Louisville	Ky.	3 cars[1]	577
1566	Cuyahoga Bd. Comrs.	Cleveland	Ohio	30a	699
1566	Cuyahoga Bd. Comrs.	Cleveland	Ohio	3,000b	699
1567	Adams County B. Com.	Hettinger	N. D.		699
1575	S. Hosp. Injured Persons	Fountain Springs	Penn.		700
1582	County Controller	Erie	Penn.		700
1585	Board of Education	Montclair	N. J.	660a	700

a Indicates anthracite coal. b Indicates bituminous. [1] Or four.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

No. 990—Kansas City, Mo.—The previous notice regarding this contract (p. 76) erroneously referred to it as for the General Hospital instead of the German Hospital, as it should have been. Address Board of Directors, German Hospital, Kansas City, Mo.

+1262—Des Moines, Iowa—This contract (pp. 324, 489, 660), which provides for furnishing the local School Board with approximately 8,000 tons of steam coal, was bid on as follows: Through 1⅜-in. screenings, $2; mine-run, $3; lump, $3.25; range, $2.75. Steam coal is used mostly on this contract, the former price ranging from $1.60 to $1.80. Address Secy. A. L. Clinite, Bd. of Edu., Des Moines, Iowa.

1501—New Orleans, La.—The Crescent Bed Co. has decided to confine its purchases to the open market, instead of contracting, as previously noted (p. 577). Address Pur. Agt. Peter Jung, Jr., Crescent Bed Co., Inc., Gravier and Broad St., New Orleans, La.

+1549—Trenton, N. J.—All the bids have been rejected on this contract (pp. 617, 699), which provides for furnishing approximately 3,500 tons of bituminous coal to the city pumping station and municpal building. It is understood that the city will readvertise for additional bids. Address City Chemist A. Parobek, City Hall, Trenton, N. J.

New Business

1588—Quechee, Vt.—The A. G. Dewey Co. at this place usually contracts about Nov. 1 for its annual requirements of coal involving approximately 12,000 tons of bituminous, 30 tons of anthracite stove and 30 tons of nut. This company has a storage capacity of 400 tons and deliveries are made by railroad. Address Pres. John J. Dewey, A. G. Dewey Co., Quechee, Vt.

1589—St. Louis, Mo.—The Liggett & Myers Tobacco Co. will receive bids until Nov. 1, for furnishing their annual fuel requirements for the fiscal year beginning Nov. 15. About 2,000 tons per month of No. 5 washed or 2-in. raw screenings will be required. Address Vice-Pres. R. D. Lewis, Liggett & Myers Co., St. Louis, Mo.

+1590—Trenton, N. J.—A city commission will receive bids until 2:30 p.m., Nov. 10, for furnishing coal to the Department of Parks and Public Property as follows: For the Pumping Station, 7,000 tons of bituminous to be delivered as required; for the Municipal Building, 50 tons of bituminous to be delivered on the first of November, January and March, and 100 tons to be delivered on Feb. 1. Complete specifications and blank contracts may be obtained on application to the Director of Parks and of Public Property on and after Oct. 6. All proposals must be accompanied by a certified check for $500. Address City Clk. Frank Thompson, Municipal Building, Trenton, N. J.

+1591—New Rockford, N. D.—The City Government will receive bids until 3 p.m. Nov. 1, for furnishing carload lots of lignite coal as may be required during the coming season. Address County Audr. James MacLachlen, New Rockford, N. D.

1592—Cincinnati, Ohio—The Cincinnati, Milford & Loveland Traction Co. usually contracts for their annual fuel requirements, involving approximately 5,000 tons of demurrage coal, some time during the fall. The company has a storage capacity of 600 tons, and deliveries are made by railroad at the rate of 100 tons per week. Address Pur. Agt. A. C. Wenzel, Cincinnati, Milford & Loveland Traction Co., 510 Sycamore St., Cincinnati, Ohio.

1593—Chicago, Ill.—The A. H. Andrews Co. will contract about Dec. 1 for 6,000 tons No. 3 raw and No. 4 washed Illinois or Indiana nut coal. Address Pur. Agt. Merrill, A. H. Andrews Co., Chicago, Ill.

+1594—Arvilla, N. D.—The County Government will receive bids until 10 a.m. Nov. 23, for furnishing the County Hospital with approximately 100 tons of Hocking Valley lump coal. Bids should be made f.o.b. siding at Arvilla. Address County Audr. Hans Anderson, Grand Forks, N. D.

+1595—Hollidaysburg, Penn.—The County Government received bids until noon Oct. 27, for furnishing and delivering approximately 700 tons of bituminous coal at the heating plant in the jail yard at Hollidaysburg, and approximately 80 tons to the Industrial Training Home at Williamsburg. The successful bidder will be required to furnish a bond for $300 guaranteeing the faithful performance of the contract. Deliveries are to extend over the period ending Dec. 31, 1916. Address County Controller T. W. Tobias, Hollidaysburg, Penn.

+1596—Kenmare, N. D.—The City Auditor at this place will receive bids until 8 p.m. Nov. 1, for furnishing coal for the various city departments as may be required during the ensuing year. Each bid must be accompanied by a bond for $200. Address City Audr. Evan Griffith, Kenmare, N. D.

+1597—Steubenville, Ohio—The Board of Education at this place will receive bids until noon Oct. 30 for furnishing coal as may be required at the public schools during the year beginning Nov. 1. Address Clk. W. S. McCauslen, Bd. of Edu., Steubenville, Ohio.

+1598—New Orleans, La.—The Public Belt Railroad Commission is receiving bids for furnishing their annual fuel requirements. A proposal form and specification for purchasing 10,000 tons, was drawn up on Oct. 22. The specifications provide for furnishing mine-run coal f.o.b. New Orleans. Address Secy. F. H. Joubert, Pub. Belt Railroad Com., 7th Floor, Municipal Bldg., New Orleans, La.

+1599—Devils Lake, N. D.—The Ramsey County Board of Commissioners will receive bids until 2 p.m. Nov. 2, for furnishing approximately 100 tons of Hocking Valley, Youghiogheny or Pocahontas mine-run or anthracite, egg or stove coal, or 200 tons of lignite coal to be delivered in the bins at the Court House. Address County Audr. J. A. Kramer, Bd. of County Comrs., Devils Lake, N. D.

+1600—Warrensburg, N. Y.—The Board of Education at this place received bids until 3 p.m. Oct. 2, for furnishing the coal required by School District No. 1 during the coming school year. Prospective bidders were required to specify the grade and quality, together with the price per ton delivered in the school building. Address Board of Education, Union Free School District No. 1, Warrensburg, N. Y.

+1601—Cameron, Mo.—The City Government at this place usually contracts for the coal required at the Municipal Light and Water Plant, about Dec. 1. Approximately 3,000 tons of nut and pea, through a 1½-in. and over ½-in. screen is required. Business is done on a competitive basis and the customary price is about $1.10 per ton, f.o.b. Cameron. Address Clk. Clarence Staples, Cameron, Mo.

+1602—Hootinger, N. D.—The Board of Education at this place received bids until Oct. 28 for furnishing approximately 50 tons of North Dakota screened lignite coal. Address Clk. Alex. Stensby, Bd. of Edu., Hootinger, N. D.

+1603—Krumroy Station, Ohio—The Board of Trustees of the Springfield Lake Sanitorium will receive bids until noon Nov. 20, for furnishing approximately 15,000 tons of 1½-in. nut, mine-run and ¾-in. screened coal. Bids will be received only on Ohio, West Virginia, Pittsburgh and Youghiogheny coal. The contract is to become effective Dec. 1. Bids will also be received for delivering the coal at the Sanitorium. Address Secy. F. L. Allen, Bd. of Trustees, Springfield Lake Sanitorium, Canton, Ohio.

1604—Chicago, Ill.—The American Malting Co. will be in the market about Dec. 1 for a year's supply of Indiana 1¼-in. screenings. This company consumes 60 tons per day. Address Purchasing Agent, American Malting Co., Chicago, Ill.

+1605—Frankfort, Ky.—Sealed bids will be received until noon, Nov. 18, for furnishing the State Capitol power house with nut and slack coal, and other buildings with lump coal. Bids are requested on Pittsburgh, Kanawha, Kentucky, Raymond City, Plymouth and Old Lee anthracite, stove and nut sizes. Bids will be considered on a heat-unit basis. Address Custodian Samuel M. Lykins, Capitol, Frankfort, Ky.

+1606—Napoleon, N. D.—The Logan County Board of Commissioners will receive bids for furnishing and delivering lignite coal to the local court house. All bids must be accompanied by certified checks for $50. Address Audr. M. W. Kelly, Napoleon, N. D.

+1607—Secaucus, N. J.—The Board of Education received bids until Oct. 26 for furnishing and delivering approximately 50 tons of pea coal and 50 tons of stove coal. Address Dist. Clk. John Bremmer, Bd. of Edu., Secaucus, N. J.

+1608—Sedalia, Mo.—The City Government will receive bids until 5 p.m. Nov. 1 for furnishing the city with coal during the period beginning Nov. 2 and ending June 1 of next year. Address City Clk. W. E. Gold, Sedalia, Mo.

1609—Kokomo, Ind.—The Indiana Railway and Light Co. usually contracts for their annual fuel requirements involving approximately 32,500 tons of Indiana screenings, some time during the fall. Deliveries are made by railroad at the rate of about 100 tons per day, and the company has storage capacity of 2,000 tons. Address Pur. Agt. R. M. Blackmore, Indiana Railway and Light Co., East Sycamore St., Kokomo, Ind.

+1610—Gascoyne, N. D.—Sealed bids are being received for furnishing Fischbein School District with coal as may be required during the coming winter. Address Clk. Gus E. Deutscher, Fischbein School District, Gascoyne, N. D.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

1184—Roaring Spring, Penn.—This contract (p. 244), which provides for furnishing and delivering approximately 100 tons of steam mine-run coal, has been awarded to the **Planing Mill Co.** at $2.05 per short ton. J. E. Gilliland bid $2.06 per ton. Address Secy. F. K. Lorenz, Roaring Spring Sch. Bd., Roaring Spring, Penn.

1431—Braddock, Penn.—This contract (p. 490), which provides for furnishing the Rankin School Board with three-quarter mine-run coal, has been awarded to **McCready Bros.,** at 8½c. per bu. Address Secy. H. W. Peters, School Bd. Braddock, Penn.

1476—Cedar Grove, N. J.—This contract (p. 531), which provides for furnishing the Essex County Hospital with approximately 19,000 tons of coal during the year beginning Nov. 1, has been awarded to **A. H. Ross & Co.** at $3.55 per ton. Address Supt. George C. Bergen, Pur. Dept., Room 206, Court House, Newark, N. J.

1486—Cooperstown, N. D.—This contract (p. 576), which provides for furnishing the Griggs County Commissioners with coal for the local Court House, has been awarded to the **Erick Erickson Co.** on the following basis: anthracite, $10.50; Hocking Valley, $7.25; Pocahontas, $7.75. Address County Audr. H. S. Rearick, Cooperstown, N. D.

+1489—Trenton, N. J.—This contract (p. 576), which provides for furnishing the State Home for Girls with coal, has been awarded to the **Philadelphia and Reading Coal and Iron Co.** on the following basis, prices not including the State Tax of 2½% of the cost of the coal at the mines: 700 tons of buckwheat at $2.50; 50 tons of chestnut, $5.85; 50 tons of stove, $5.50. Address Supt. (Mrs.) E. V. H. Mansell, New Jersey State Home for Girls, Trenton, N. J.

1492—Vintondale, Penn.—This contract (p. 576), which provides for furnishing the local school buildings with coal as required during the ensuing year, has been awarded to the **Vinton Colliery Co.,** on mine-run coal at $2.50 per ton delivered. This company was the only bidder on this business. Address Secy. George S. Blewett, Vintondale, Penn.

1495—Ashtabula, Ohio—This contract (p. 577), which provides for furnishing the Ashtabula County Commissioners with coal during the year beginning Oct. 15, has been awarded to the **Fairview Mining Co.,** at $1.99 per ton on mine-run coal and $2.09¾ for three-quarter inch screened lump. This company was the lowest of a number of bidders on this business. Address Clk. B. E. Brainard, Water County Comrs. Ashtabula, Ohio.

+1497—Cleveland, Ohio—This contract (pp. 577, 616, 699), which provides for furnishing the City Water-Works with its annual fuel requirements, involving approximately 75,000 tons of slack coal, has been awarded to the **Valley Camp Coal Co.,** the gross consideration being $145,000. Address Comr. of Purchases and Supplies A. R. Callow, 511 City Hall, Cleveland, Ohio.

+1502—Bismarck, N. D.—Awards have been made on this contract (p. 577), which provides for furnishing the various state schools with approximately 6,000 tons of coal, as follows: **North Dakota Lignite Mines Co.** (Dickson, N. D.), 5,000 tons of steam coal for the Agricultural College at Fargo, at $2.47; same company, 100 tons for the State School of Forestry at Bottineau, $2.65. **Washburn Lignite Coal Co.** (Wilton, N. D.), 100 tons for the State School of Science at Wahpeton, at $2.42; same company, 100 tons for the State Normal Industrial School at Ellendale, $2.30. **Interior Lumber Co.,** of Fargo, was awarded a contract for a small car of blacksmith coal and a car of anthracite for the Agricultural College at Fargo, and **J. E. Morris,** of Wahpeton, was awarded approximately the same amount for the State School of Science. Address Secy. Charles Brewer, State Bd. of Regents, Bismarck, N. D.

+1509—White Rock, S. D.—This contract (p. 577), which provides for furnishing the Board of County Commissioners with approximately 100 tons of bituminous and 15 tons of anthracite coal, has been awarded to **O. L. Axness & Co.** at $6 per ton for bituminous and $10 per ton for anthracite. Address County Audr. O. E. Lien, Bd. of County Comrs., White Rock, S. D.

+1511—Bedford, Ind.—This contract (p. 577), which provides for furnishing the Lawrence County Poor Farm with approximately 100 tons of coal, has been awarded to **Gale L. Wilking,** at $2.55 per ton for Indiana lump coal delivered at the farm. Address Audr. E. W. Edwards, County Comrs., Bedford, Ind.

+1512—Portage, Penn.—This contract (p. 577), which provides for furnishing Miller vein or C prime coal to the local schools during the ensuing year as may be required, has been awarded to **E. M. Eicher** at $2.10 per ton delivered. Address Secy. H. D. Border, School Bd., Portage, Penn.

1517—Sioux Falls, S. D.—This contract (p. 577), which provides for furnishing approximately 250 tons of bituminous and 50 tons of anthracite coal, has been awarded as follows: **A. S. Johnson & Co.,** Hocking Valley, $6.95; **Sioux Falls Fuel Co.,** anthracite, $10.60. W. A. Mills Co. bid $6.98 on bituminous and $10.70 on anthracite, and H T. Parmley bid $7 on bituminous, $10.75 on anthracite. Address Audr. H. H. Howe, Minnehaha County, Sioux Falls, S. D.

1520—Akron, Ohio—This contract (p. 577), which provides for furnishing the Summit County Court House, Jail and County Infirmary with coal, has been awarded to the **Alages Coal & Ice Co.,** at $1.75 per ton for Youghiogheny slack coal. The Akron Coal Co. bid $1.80 for the same, and the Citizens Coal Co., bid $1.65 for Cambridge slack. Address Clk. U. G. High, Summit County, Akron, Ohio.

+1527—Flandreau, S. D.—This contract (p. 616), which provides for furnishing the local City Government with 12 to 13 cars of Youghiogheny lump coal for use at the city pumping station, has been awarded to **O. A. J. Aaker.** Address Clk. J. R. Coonrod, Flandreau, S. D.

+1529—Glasgow, Mont.—This contract (p. 616), which provides for furnishing the Valley County Board of Commissioners with coal for the Court House and Jail during the coming year, has been awarded to **W. W. Hurd,** at $7.75 per ton for Bear Creek lump. Address Clk., W. B. Shoemaker, Bd. of County Comrs., Glasgow, Mont.

+1538—Wellsville, Ohio—This contract (p. 617), which provides for furnishing the local Board of Education with 1¼-in. Pittsburgh coal, has been awarded to **D. A. Forbes,** at $2.27½ per ton. Address Clk. F. H. Eckfeld, Bd. of Edu., Wellsville, Ohio.

+1539—Woonsocket, S. D.—This contract (p. 617), which provides for furnishing the Sanborn County Court House with coal during the coming season, has been awarded to the **J. F. Anderson Lumber Co.,** at $5.98 per ton. Other bidders on this business were Colman Lumber Co., $6.22; C. H. Holonel (Alpena, S. D.), $6.20; F. N. Thisen, $6.25; S. D. Grain Co., $6.75; Farmers Elevator Co., $6.37. Address County Audr. C. B. Jacobson, Woonsocket, S. D.

Contract Notes

Hillsboro, N. H.—The Hillsboro Woolen Mills Co. consume about 125 tons of bituminous coal per month.

Woodbury City, N. J.—The contract for furnishing 45 tons of Lehigh coal to the City Hall and Fire Houses has been awarded to **S. A. Stewart,** at $6.04 per ton, delivered.

Noblesville, Ind.—The contract for furnishing the Hamilton County poor farm with approximately 100 tons of coal has been awarded to the **Noblesville Fuel and Supply Co.** at $3.95 per ton.

Dallas, Tex.—The J. W. Thompson Construction Co. has renewed its contract with the **McAlester Fuel Co.** for 8,000 tons of steam coal to be used in construction of the Union Terminal at Dallas, Tex.

Jeffersonville, Ind.—Contracts for county coal have been let as follows: 90 tons nut and slack, **F. M. Rose Coal Co.,** $2.45; 80 tons lump, **Drabelle-Yager Co.,** $3; 40 tons lump, **St. Bernard Mining Co.,** $3.35.

Lincoln, Neb.—The contract for furnishing the Police and Fire Department with coal during the year beginning Sept. 6 has been awarded to the **Easley-Graham Coal Co.** at $10.45 per ton for Pennsylvania anthracite nut.

Lockland, Ohio—The contract of the Philip Cary Manufacturing Co., involving 10,000 tons of coal, has been awarded through the **Kentucky Fuel Co.,** of Cincinnati, on the Loony Creek Coal Co.'s "Loony Creek" nut and slack coal.

Lewiston' Maine—The Lewiston "Journal" Co. has awarded a contract for furnishing 375 tons of New River coal to the **Pulsifer & Young Co.,** of Auburn. Of this, 200 tons is already delivered and the remainder will be delivered as needed.

Auburn, Maine—The Androscoggin Foundry Co. has awarded a contract for 16 cars of Jamison coke at $6 a ton to **Rogers, Brown & Co.,** of Boston. This contract expires in June, 1916. The coke will be delivered f.o.b. Auburn on M. C. R.R. tracks.

Fitchburg, Mass.—Crocker-Burbank Co., paper manufacturer, has awarded a contract for approximately 50,000 tons for the 12 months from Oct. 1, 1915, to the **Consolidation Coal Co.** on Georges Creek coal for delivery via water to Mystic Wharf, Boston.

Memphis, Tenn.—Memphis coal dealers recently announced a flat increase of 15c. per ton on Kentucky and Illinois coal, on account of the recent increase in freight rates. The increase will figure 15c. on 10 barrels to domestic users and 15c. per ton to steam users.

Houston, Tex.—Cargo of 2,800 tons of coal from Philadelphia on board the steamship Wilhelmina, consigned to J. H. Carroll, reached Houston on Oct. 23. The coal is for distribution to various coal yards in the interior of Texas, and will be shipped out by rail.

McAlester, Okla.—The contract for furnishing the local School Board with 500 tons of McAlester nut coal was awarded on Oct. 9 to **William Mullen** at $2.95 per ton. This is at 20c. below the contract price last year. Address Secretary School Board, McAlester, Okla.

Edmonton, Alberta, Canada—The contract for supplying the Civic Building with coal during the coming season has been awarded to the **Edmonton Standard Coal Co.** at $2.60 per ton for screened lump coal. Six bids were submitted on the business at prices ranging from $2.60 to $3.25 per ton.

Detroit, Mich.—The Detroit Copper and Brass Rolling Mills Co. has awarded to **Jewett, Bigelow & Brooks** the contract for supplying about 10,000 tons of nut, pea and slack to be delivered at the company's plant, Detroit. The price is not made public, but is understood to have been around $2.15.

Knoxville, Tenn.—The contract for coal for the City of Knoxville was not let by the old board, but has been brought over to the new board, just elected and installed. This new board has referred the matter to City Commissioners N. T. Little and J. G. Crumbliss, and it is said they will readvertise for bids.

Netherlands—Coal, selling prices Rotterdam, steam $7, gas $10; ocean freight, $9.50 per metric ton; imports materially reduced from previous years. Netherlands Oversea Trust will receive shipments for strictly Dutch firms. There is a so-called coal bureau which is designed to distribute to small consumers.

Ames, Iowa—The Electric Light & Water Department at this place consumes about 6,000 tons of steam coal per annum. The business is not done on competitive bids, and there is no contract. The usual price is about $2 per ton on track at Ames. Address Supt. Charles E. Warsaw, City of Ames, Electric Light and Water Dept., Ames, Iowa.

Detroit, Mich.—A contract for furnishing the United States Engineer Service at Sault Ste. Marie with 200 tons of three-quarter lump coal has been awarded to the **George Kemn Coal Co.** at $2.90 per ton. The Perry Coal Co. bid $2.90 and the Port Royal Dock Co., $3. Address Supt. L. C. Sabin, American Falls of St. Marys River, Sault Ste. Marie, Mich.

St. Joseph—The contract to furnish coal during the coming year for the Missouri State Hospital for the Insane at St. Joseph has been awarded to the **Pickering Coal Co.** of Richmond, Mo. It is claimed that this contract is awarded after an investigation as to the system of mining and a test of several car loads. The amount of coal consumed is about 10,000 tons.

Savannah, Ga.—Forty thousand tons of steam coal were bunkered from lighters in Savannah during the first six months of this year. Contracts are now pending whereby this business will be transferred to Charleston, N. C., the vessels taking bunkers from the new Southern Ry. coal terminals plant recently opened there. The greater part of this new Charleston fuel business will be done in Clinchfield coal.

Topeka, Kan.—The County Commissioners have let the contract for the coal supply for the ensuing year to the **Topeka Cold Storage, Ice and Fuel Co.,** at $3.24 per ton, and the **Topeka Coal Co.** on coarse mill at $2.85. It also contracted for Osage lump for the indigent poor to the **Topeka Coal Co.** at $3.72. For the poor farm, Osage lump coal to the **Jackson-Walker Co.** at $3.17. For the Crittendon Home to the **Southwestern Coal Co.,** on Osage lump, $3.80.

Toledo, Ohio—The Board of Control has awarded a number of small contracts for various city departments. The **Big Four Coal Co.** was given the contract for 500 tons of Pocahontas mine-run at $2.75 for the House of Correction, 50 tons of Hocking lump to the fire department at $3.25, and 180 tons of Pocahontas mine-run to the police department at $3.25. The **West Crescent Coal Co.,** Toledo, will supply 100 tons of Jackson lump to the county hospital at $4.25.

Auburn, Maine—The contract for the supply of coal for heating the Androscoggin County buildings was awarded to **W. E. Cloutier & Co.,** of Lewiston. Georges Creek coal was specified and about 500 tons are used during the year. There is storage capacity for 150 tons and this amount was delivered, the remainder to be supplied as needed. The contract price was less than $4.75. This contract expires in July, 1916, and is advertised for by the County Commissioners. George Pottle is chairman.

Boston, Mass.—It is understood that the Bay State Ry. has recently purchased an extra supply of low volatile steaming coal amounting to approximately 15,000 tons. For the regular contract of this company, involving about 156,000 tons, see contract 802, Vol. 7, pp. 1005, 1085, 1128. This latest purchase provides for 9,000 tons to be delivered alongside power stations, Quincy Point, Mass., and 3,000 tons each to Lynn and Chelsea, Mass. Deliveries are to be completed in 60 days. It is understood that the Quincy Point order was awarded to the **Chesapeake & Ohio Coal Agency** on New River coal and the Lynn and Chelsea portions to the **Consolidation Coal Co.** on Georges Creek coal.

Billings, Mont.—The contract for furnishing Yellowstone County with coal for the coming year was let to the **Hallowell Coal and Feed Co.,** their bid being the lowest. This contract calls for approximately 1,500 tons of coal. The successful bid follows: No. 1 lump coal, delivered at the court-house, county jail and poor in Billings, $4.40 per ton; delivered at the county poor farm and detention hospital, $5.25 per ton. The other bids were: Crystal Ice and Fuel Co., court-house and jail, $4.60 per ton; poor in Billings, $4.85 per ton; poor farm and detention hospital, $5.10 per ton. C. E. Tarr Coal and Ice Co., court-house and jail, $4.75; detention hospital and poor farm, $5.50; poor in Billings, $5.25. Billings Coal and Ice Co., court-house and jail, $4.75; detention hospital and poor farm, $5.50; poor in Billings, $4.90.

Kansas City, Mo.—The contract for furnishing the local City Water-Works with coal (p. 286), which was announced as being awarded to the Central Coal and Coke Co. at $2.20 per ton for mill and $2.05 per ton for slack, failed to be approved by the City Council, and is still being considered. Bids received on the contract were as follows:

	Slack	Mill Run	Nut	Cherok. M.-R.	Washed Slack	Screen. Lump
Central Coal & C. Co.	$2.05	$2.20	$2.54	$2.40	$3.05	$2.64
Cherokee Fuel Co..	2.05	2.30	2.45	2.30	3.05	2.55
Gray-Bryan S. C. Co.	2.05	2.25	2.60	2.45	3.05	2.70
K. C. Coal & Mat. Co..	2.05	2.30	2.55	2.55	...	3.05

For the fiscal year 1914 there was used 6,960 tons of slack, 24,607 tons of mill-run and 717 tons of nut coal. There were no other kinds of coal used. Address Pres. J. D. Eubank, Bd. of Fire and Water Comrs., Kansas City, Mo.

COAL AGE

ONE OF THE HILL ENGINEERING WEEKLIES

Vol. 8 NEW YORK, NOVEMBER 6, 1915 No. 19

To All Coal-Mining Men

AT PRESENT the coal industry is in a position to support only one large paper devoted to its interests. Careful observation and actual experience have proved this fact. Two papers were attempting to cover the field—**The Colliery Engineer** as a monthly and **Coal Age** as a weekly. Each accomplished much, and the total effort of both acting independently was considerable, but there was a large loss due to an overlapping of fields.

Those readers who were desirous of missing nothing paid for both papers and received in return a duplication of articles that was, to say the least, not pleasing. The subscribers to only one of the two papers necessarily failed to keep themselves fully informed.

The logical thing has happened—**Coal Age,** with its youth, aggressiveness, broader field and greater comparative investment, has combined with **The Colliery Engineer.** The younger journal needed the age and prestige of its staid and sturdy contemporary.

Of the ten men who now fill the more important positions on the editorial and business staffs of the new paper that results from the consolidation, five were formerly employed by **The Colliery Engineer,** which fact makes it plain that the combine was actually a consolidation and not an absorption.

The new plans of this enlarged paper cannot be stated on a single page. However, they call for a continuation of each and every good feature of both journals. Any added income will go toward covering the cost of a more detailed editorial campaign designed to make **Coal Age** and **The Colliery Engineer** as one paper the most complete and the most satisfying engineering and trade journal in the world.

We want you to say: "**If it wasn't in Coal Age** it didn't happen."

The new paper will have 39 regular and staff contributors. These men are located in every important American coal-mining and fuel-consuming center. Two of them are in Europe and two in Canada gathering news and covering important coal developments. One man is traveling in South America, materializing dreams of foreign circulation in a market that will soon belong to American producers.

One member of the **Coal Age** staff is a lawyer—he handles all legal questions. Another is a doctor versed in first-aid and competent to advise along medical lines.

Five editors are graduate mining engineers of varied experience. Another member of the regular staff is a mechanical engineer who devotes his time exclusively to questions along mechanical and electrical lines.

If you want to know about a problem in law as it affects coal mining, a lawyer will tell you; if it's a question in medicine as it relates to first-aid or resuscitation, you will be advised by a doctor. Pump problems go to a specialist; so do questions on ventilation, gases, surveying, roof support, sociology, mining and the like.

In behalf of **Coal Age** we warmly welcome readers and friends of **The Colliery Engineer.** We will please you if you are interested in coal literature. You will pay us very little more, and in return will receive annually about 2,200 pages of carefully edited information, which compares with less than 700 pages you have heretofore been receiving. We invite you to contribute to our paper and to enter into our discussions. There is no reason why you should not receive a share of the $20,000 we pay for articles and news each year.

You old readers of **Coal Age**—in behalf of **The Colliery Engineer,** we bid for your friendship. As the oldest of all coal papers, it brings you something in the way of ripe experience that even the enthusiasm of youth can't duplicate. It brings you its loyal friends, many grown gray in the service; and what can improve on the winning qualities of seasoned experience when it is combined with the courage, energy and freshness of youth?

Ideas and Suggestions

Efficiency Index for Coal Mines

By Sheldon Smillie*

After a mine manager has solved all the knotty little individual problems of the mines under his control and things begin to work smoothly, he begins to wonder how his mines compare with other mines in his vicinity, whether better or worse and how much so. A knowledge of this would offer a direct line of attack for the improvement of his operation. Costs may be compared, but the large variety of methods employed and in many places their crudity make them of rather uncertain value, and in most cases a company is rather loath to impart this information.

Labor represents by far the largest percentage of the cost of production, and the most important feature therefore for the manager to know is whether his labor returns him as much as does that of his competitors. A recent writer has suggested a "labor factor," the ratio of the number of company men to the tonnage produced. This gives certain valuable comparisons for the immediate vicinity where the labor conditions may be all the same, but is subject to fluctuations in comparisons between all pick, puncher, shortwall and longwall mining, according to the division drawn between miners and others.

Efficiency of the daymen may be high, but the miners and loaders may be waiting for cars and not working to the best advantage. An extra employee here and there inside may not in himself be working to the best of his time, but he may be helping the miners to double their output. A better basis of comparison would appear to be one involving the output per man employed inside.

An Interesting Comparison

Some time ago I made up the accompanying table showing a comparison between the largest producers in the central Pennsylvania field operating on the thinner seams of coal, the Freeports and Kittannings, from data taken from the state mine inspector's report. These figures may be inaccurate in minor details, but are probably equally correct for all. The collieries are arranged according to the thickness of the seam, and the final tonnage is divided by the thickness of the seam in feet, so as to put all on an even basis. While the thickness of the seam does not affect the day labor as much as the miner, it does to a certain extent affect the former, for the thicker seams make fewer cars to handle per ton.

It will be noticed that there is a wide variation in the tonnage handled by the men outside the mine. This is to be expected, as conditions vary more widely outside than inside, the matter of picking probably having more influence than any other. Some companies purchase power, but I believe most of those on the list are so large they have found it economical to produce their own or are producing it, because their plants were installed before it was convenient to purchase power. All employees engaged in the manufacture of coke have been eliminated. With a general knowledge of the conditions existing in each case, a fairly reliable comparison should be reached.

PRODUCTION EFFICIENCY OF VARIOUS COMPANIES IN CENTRAL PENNSYLVANIA

Compiled from Mine Inspector's 1912 Report

Thickness of Coal, In.	Company	Tons per Man per Day: Inside	Tons per Man per Day: Outside	Tons per Man per Day: Inside and Outside	Foot-Tons	Standing
38	A	....	....	2.27	0.72	12
40	B	3.45	19.3	2.91	0.87	6
42	C	4.43	21.3	3.60	1.28	1
..	D	3.56	28.1	3.16	0.90	3
..	E	2.72	30.4	2.50	0.71	13
45	F	3.96	45.2	3.65	0.97	2
46	G	3.68	43.3	3.40	0.89	5
48	H	4.06	31.7	3.60	0.90	4
..	I	3.53	87.0	3.39	0.85	7
..	J	2.92	11.1	2.31	0.46	18
56	K	4.67	25.8	3.95	0.84	9
58	L	4.73	14.3	3.56	0.73	11
60	M	4.12	36.5	3.70	0.74	10
..	N	4.15	16.4	3.31	0.66	15
66	O	5.53	30.3	4.68	0.85	8
67	P	3.90	25.7	3.40	0.61	16
72	Q	4.77	34.4	4.12	0.68	14
..	R	4.27	20.7	3.52	0.58	17
Average			30.1		0.79	

In offering the above table which I shall call an "efficiency index," I do not consider that an absolute basis of comparison is reached, but merely one more satisfactory than any I have so far seen, and I hope that by starting a discussion of the subject more light may be shed on it.

⁂

Mine Maps vs. Mine Sketches

By H. L. Fickett*

The laws of every state in which coal is mined require that periodically the operating companies file with the chief mine inspector certified maps of the workings of the mines operated by them. The object of such laws is obvious. These maps are the records by means of which the state will be able to estimate the amount of its mineral wealth consumed and to which posterity in time to come will refer for information.

The importance of these documents cannot be overlooked. Yet it is a well-known fact that many of the maps submitted are in reality but mere sketches, often beautiful from the viewpoint of the draftsman, but owing to abounding inaccuracies practically worthless to the operators.

In such sketches the letter of the law has been fulfilled, but the spirit has been neglected. Large companies have long since come to realize the value of accurate maps, because at some time in their career one of these sketches has caused the expenditure of thousands of dollars that would have been saved if the information had been reliable. Hence these suggestions are more to the small operator, with the hope that he may realize that to neglect or slight his maps is not economy, but extravagance in the long run.

Since the coal companies' stock in trade is the coal that lies beneath the ground, it is important that they, like the merchants, keep an accurate record of that which is taken out and that which is left. Their maps furnish the only means of taking an inventory. If they have been accurately made, at the end of their examination of the maps the operators will know as much concerning their assets as the merchant who has been able to see and to touch each article in his establishment.

---

*Indiana, Penn.

*Belle Ellen, Ala.

The nature of mining makes it impossible after a short time to inspect the workings, especially if there has been any robbing. Then it is that the map asserts its value and furnishes the best means for locating blocks of coal that have been left untouched. Such maps are also valuable in the location of new haulways and in the execution of other improvements. If the map is what it should be, no difficulty will be encountered in carrying out the plans successfully, but if it is not, the loss of time and money may be appalling.

Losses Owing to Incomplete Mine Plans

A poor map is often the result of the operator's idea that if a contracting engineer visits the mine only once or twice each year for a couple of days and makes a map that will pass the inspector he possesses something that supplies his needs. The requirements of the present have been met, and the average cost per ton of coal for the year has been reduced by not having a regular force to look after the mapping of the mine.

But the future has been neglected. Such methods were pursued by a certain small company. They had a number of men to make extensions on their map about once each year, always making it plain that the least time spent at the plant the better. When, after the mine had been in operation for a number of years, a new short-cut haulway had to be installed, it was found that their map was not worth the paper it was printed on. New surveys had to be made and a new map plotted of the area through which the new slope was to go. The price of the new work was a loss, since an accurate map would have furnished the necessary information.

Another instance was that of a company operating a block of coal on a lease. The engineering department was looked upon as a luxury and maps as an extravagance. After the mine had been worked out and the pillars drawn, the owners claimed that they had not received enough royalty and filed suit for a large amount. Tipple weights had been misplaced, and the only document upon which a settlement could be made was the map, which because of the views of the operators had been poorly kept. It was not even an approximation.

The attorneys, not knowing the accuracy of the map, agreed to leave it to competent engineers to figure from the map the tonnage obtained. This was done, with the result that the operating company paid out thousands of dollars in royalty for coal that was never mined owing to the existence of unfavorable conditions, but which was shown as extracted by a mere sketch that bore the dignified title of "mine map."

Blocks of coal have been left because there was no available information as to how to recover them. Money has been spent looking for pillars that have been drawn, but are shown to be in place. And instances of mines being drowned out by cutting into old workings not recorded or shown at a safe distance are familiar to all.

Keeping in mind the old adage that "anything that is worth doing at all is worth doing well," the engineer should take pride in making his maps accurate. It is the practice of too many engineers to go into the mines with but one idea in view—that of getting out as quickly as possible. Their haste causes the oversight of important details that ought to be recorded. They forget that their time is not their own, but is the property of the company which retains them. They run accurate transit lines in each heading, then offset their careful work by measuring rooms in a careless manner. Since by far the greater territory is worked by rooms, it is important that these be not only measured, but located carefully.

There is not an engineer who would go into a mine and be content with getting the bearing of each room and then plotting the bearings on his map. Still there are many who rush into the mine and are content with getting distances without bearings, never thinking that for the purpose of accurate work distances without bearings are as useless as bearings without distances. Bearings may be determined with the magnetic compass, but the results are always more or less unsatisfactory owing to the presence of attracting forces that cause the needle to vary. There is still a better method.

Some Suggestions

That method is to first decide upon a plan for working a mine or for working each section of a mine if such is necessary. Then have everything driven on centers according to the accepted plan. All rooms should be measured carefully shortly after they have been worked out. Offsets should be taken to the ribs at regular intervals, and also where irregularities in the working places demand them. If a place is stopped before it has been driven to its working limit, it is a good plan to note on the map the reason for stopping it. Then in the future anyone who examines the map may understand immediately why each block of coal was not taken out in the order of its development.

Where the mines are in a seam of varying thickness it is a good plan to note the thickness of the seam at regular intervals. Every bit of information that can be placed on a map will become more valuable as time passes, and the map will be more useful to those whose capital has purchased it. Service should be the watchword of every engineer. It is a good plan to take the map and a scale and check the tipple weights for a year, by finding the volume extracted and multiplying this amount by the weight of the coal per cubic foot. If the map is correct, it should check the output over the selected time within a small percentage.

In conclusion, let it be said that the mine map should be kept with all the care of a set of books, and each mark on a map, like each figure in a trial balance, should be correct and should have a definite meaning. The engineer should devote as much of his time to making a good map as to executing a piece of construction that is to serve the company for years to come.

Let there be more good maps and less sketches, for the difference in the cost of a good map and a sketch is small, while the difference in value between the two may amount to thousands of dollars. Let the small operator realize that a map is more than a parchment exacted by a tyranical legislature—it is something of tangible value, worth dollars and cents, to be prepared carefully, kept safely and consulted frequently.

Modern Mine-Plant Design--I

By M. L. Hyde*

SYNOPSIS—The most advantageous arrangement of surface works at a coal mine is a perplexing problem. This article, which is the first of two on this subject, advocates an arrangement of buildings which has many obvious advantages, but which is a decided departure from American practice.

These articles are addressed to the official who is facing the problem of designing, constructing and operating a modern mining plant—a plant to meet not only the exacting demands of today, but one with an elasticity that will allow of its conquering any phase of future market requirements.

A reasonable first cost, combined with the lowest operating and maintenance expenses, ease of extension, safety and sightliness, are to be secured; and in this day of radical improvements, it is indeed hard to feel that the accepted designs will prove efficient 20 years hence.

The line between good and bad design is a clearly marked one to the specialist, with fortunately a wide choice of properly designed and fabricated equipment, but with little margin so far as correct arrangement of units or assembly of elements is concerned.

Where equipment is to be purchased, it is often the custom to call in several manufacturers with the request that they furnish competitive designs and tenders. From these the best points are culled and a final design offered for bids. Such a proceeding is most unfair to the original bidders, is not good business and usually defeats its own purpose. Specifications while seeming to cover all points of each item as desired may yet prove far from satisfactory. As a rule it is safe to assume that any marked difference in first cost will be compensated by poorer workmanship, materials and details and will in the end prove an expensive bargain. Consultation with a specialist would have avoided such a result.

It is intended here to cover only the general features of plant design, but so far as possible all items of equipment will be specified to be of a given make or its equal. This is with no thought of influencing the purchaser, but merely that a standard of the highest type may be set.

In the layout described, a capacity of from 1,000 to 3,000 tons per day has been taken as covering the average mine output. The location of each unit represents careful study, and each has been set relative to its importance in the daily operative routine; for a mine is an organization of absolute routine, governed from beginning to end of shift by fixed laws, which must be observed in every detail. Men, coal and supplies are daily handled over specified courses, and in this process success calls for minimums in distances and in energy expended. Not only must the routine of operation be solved, but that of idleness as well, be the cause of such idleness lack of market, fire, strikes, accidents, or what it may.

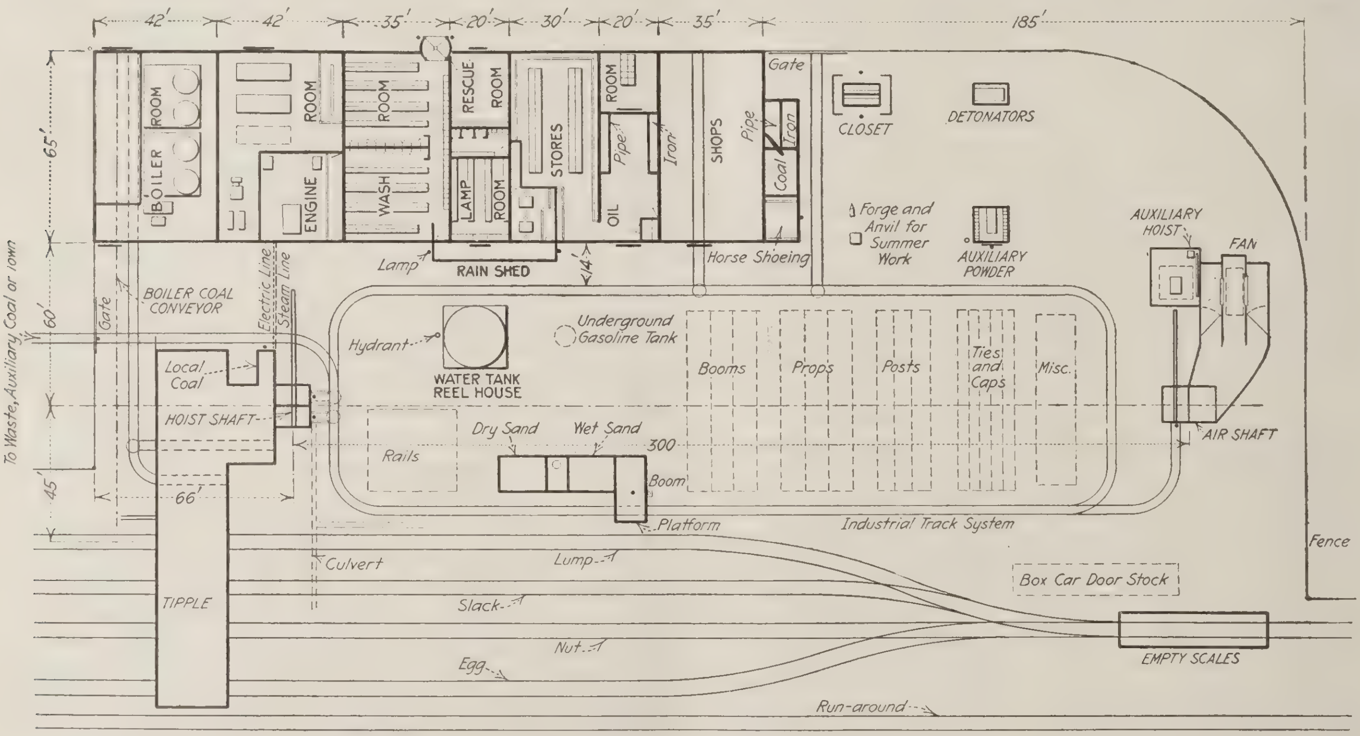

FIG. 1. GENERAL ARRANGEMENT OF MINE BUILDINGS

Concentration of Units Is Advantageous

Concentration is the golden rule to be followed in the general layout. Short distances allow of easier fire protection, inspection, upkeep and moving of men and supplies than can be realized from a haphazard, sprawled-out design.

---

*Pembina Coal Co., Evansburgh, Alta.

A rectangular yard with a central lane dividing it the long way meets nicely the conditions imposed. Lights and hydrants on this lane facilitate the watchman's duty, allow of lighting the entire plant at a minimum cost and force all travel over one course. A stout wire fence, 8 ft. in height, should surround the yard, with lights placed at each corner.

Two industrial track systems are required—an inside one for handling damaged cars, machines, locomotives, general supplies, etc., and an outside system for handling coal to the houses, ashes from the boilers, waste from the tipple or houses, powder from the magazine and for delivering store supplies. A boy with a gasoline locomotive on these systems displaces from one to two teams, with a corresponding saving.

The determining factor of a satisfactory layout is the handling of men, coal and supplies. All employees should enter the works through the washroom, where they change clothes, proceeding thence to the lamproom for lamp and check, to the overman's office for instructions, to the auxiliary powder magazine for powder canister, to the shop for sharpened tools, and finally to the mine, after hanging their checks on the tally board. During this time they should not have had to step off the lane.

Coming from the mine, a man first removes his check from the tally board, deposits check and lamp at the lamproom and gives in his time at the office, his dull tools at the shop and his empty or partly empty powder canister at the magazine. He then goes direct to the washroom for bath and change and from the washroom to the outside. This avoids confusion and encourages promptitude and cleanliness on the part of the men, in the care both of their persons and of the company's property. With one or two waste barrels on the lane, the necessity of throwing fruit skins, burned-out carbide or cigar butts on the ground is eliminated.

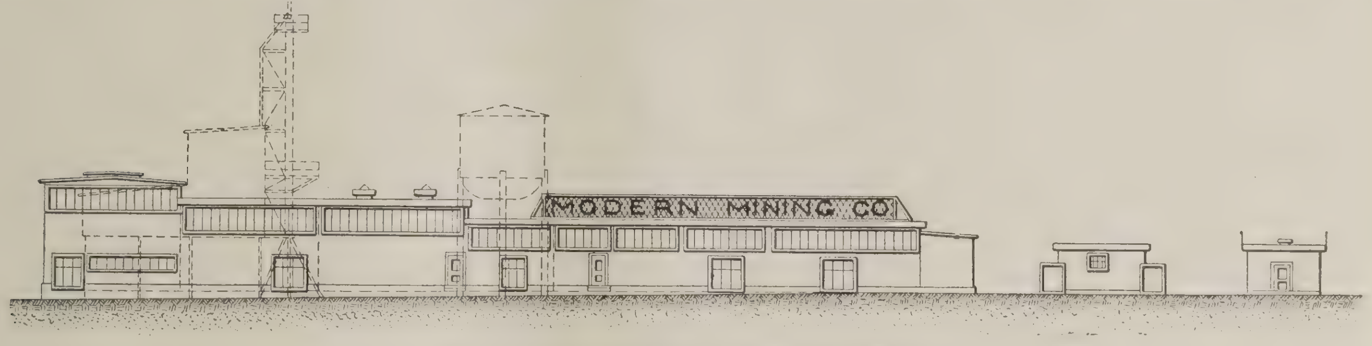

FIG. 2. SIDE VIEW OF MINE BUILDINGS

The outer door to the washroom should be open, and an attendant should be on duty at all hours. The inner door leading to the works must be locked during shutdowns and the key be placed in charge of the attendant. This man then sees every person attempting to enter the plant, and by having him appointed a deputy, perfect control is secured. Just off the central lane should be placed a water-closet for the use of men and officers.

The handling and preparation of coal for market has been covered in previous articles.

Power-plant coal for boiler or producer consumption should be taken by a cable conveyor direct to bunkers supplying these units.

Local or house coal should be discharged from the tipple direct to a car on the outside industrial track and thence be pulled by a locomotive to the house for which it is destined. Arrangements must also be made to allow of the tipple boss admitting and loading wagons for local supply. Whether cars or wagons are loaded, the bin should be so located that in getting their load these do not interfere in any way with the routine of the plant nor come in contact with any of the workmen.

Blacksmith and sand-drier coal should be unloaded first from the tipple to cars on the inside industrial tracks and thence transferred to bins.

Careful Arrangements Are Required

Supplies are generally purchased in much greater quantities than needed for immediate use and therefore require a minimum of two handlings—from car to storage and from storage to point of application. Here every facility should be afforded for economical work.

Rails are the heaviest commodity daily used, and their storage must be at such a point that they can be skidded from the car to stock and from stock lifted to the cage for lowering.

Next in importance are the mine timbers—ties, props, caps, etc. In storing these the element of fire hazard enters, and at least 100-ft. clearance between stocks and the hoist shaft is required. All timbers should be unloaded direct from cars to stock and thence to mine cars, with one handling in each case.

Moderately heavy supplies that are usually piled on top of one another—such as ropes, cement, lime, fireclay, roofing, etc., or bar iron and pipes which are stocked in racks—should be unloaded to a partitioned section of the storeroom, having overhead trolley service from the car to the warehouse interior. The same applies to barrels of oil, with the exception that a fireproof partition should separate the two stocks.

General supplies—such as paints, nails, waste, electric, mechanical and plumbing fittings, machine repairs, etc., that are carried in bins or on shelves—are handled from railroad cars to the inside industrial system and thence to the main storehouse.

Supplies that are seldom used—such as building lumber, heavy framing, brick, second-hand machinery, etc.—may be stored in one corner of the yard where they will not interfere with those more in demand and yet receive the benefit of industrial track service.

For unloading mine cars, machines, locomotives, heavy repairs, etc., a 12-ton mast and boom is required at the unloading platform. It should have sufficient swing to lift from the railroad car to the industrial track.

Sand for mine locomotives, if received in a wet condition, must go from the car to the wet storage with one shoveling; thence it passes through the drier to the dry bin enjoying the industrial-track service.

Scrap iron from the shop and ashes from the forge and drier are sent to waste or storage piles over the shortest paths. Ashes from the power plant are pulled out in cars running in a tunnel below the boilers or producers to the common waste track serving the waste bins under the tipple. The lump-coal boxcar-loader runner operates, during lulls in coal loading, a three-drum electric hoist placed adjacent to his loader. One drum on this hoist pulls ash cars from the power plant, another handles all cars on the waste-pile trestle, and the third is used for railroad cars in the yard. By means of turntables, cars conveying ashes or garbage from the houses may be sent to the waste pile.

The main powder magazine is located at the end of the waste yard, with industrial service for filling or emptying.

Carefully laid-out grades, ample drainage, 80-lb. steel with creosoted ties on 24-in. centers, heavy ballast, as few turns as possible against the locomotive pulling out trips of loads, switches coming together at given points, not over two switches to be thrown for spotting empties on any given grade track, and an average storage of four empties on each track under the tipple—all these are the essential features of a well-laid-out railroad yard. The ladder or scissors track layout at the tipple is not recommended.

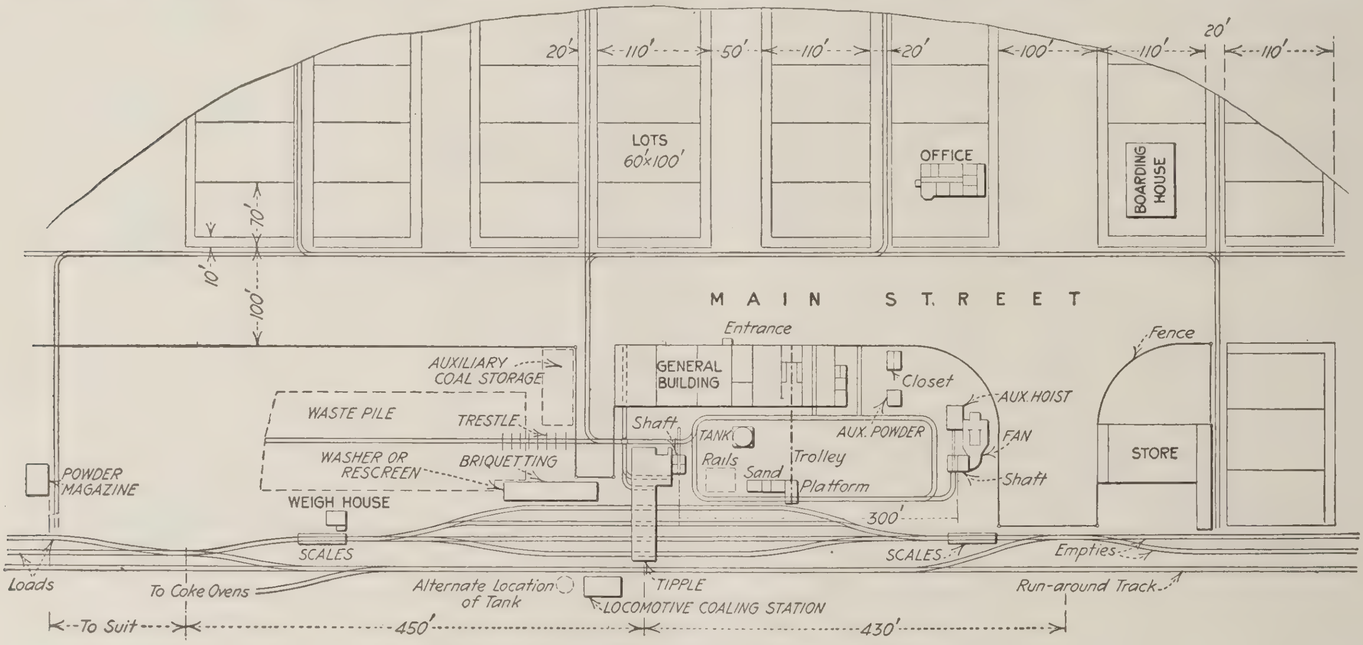

FIG. 3. ARRANGEMENT OF PLANT AND TOWN

The Store Should Be Served by Both Industrial and Railroad Tracks

The store, if run by the company, should be located adjacent to the empty storage yard for cars, enabling carload lots of merchandise to be handled direct. It should be accessible to men coming or going from work, be near to the main office and should enjoy service over the outside industrial track.

The mine office should overlook the plant, with the superintendent's room so placed that the entrance to the plant and the moving of cars may be seen from his desk.

Playgrounds, clubhouse, ballfields, etc., should be at the far end of the town, and every effort should be made to group the houses so that each employee has the shortest possible distance to traverse in his share of the daily routine. While winding boulevards enhance the beauty of a mining village, straight lines are just as pleasing and rent charges are materially in their favor.

The plant inclosure should be east and west, if possible, with the waste piles at the opposite end from the direction of prevailing winds. The townsite should extend either to the north or south.

All Building Units Should Be Under One Roof

Individual buildings housing individual units can no more compete with the low first cost and operating expense of the general departmental unit than can individual stores compete with the large department store.

Too much emphasis cannot be laid on this point: No operator should consider a layout in which, provided the ground surface is suitable, the boiler room, engine room, washroom, lamproom, rescue station, warehouse, overman's office, oilroom and shops are not under one roof; and, barring powder or detonator magazines, this applies to any other units required.

The first cost, space occupied, maintenance and operating expense are all less, while heating, ventilation, draining, lighting, plumbing, inspecting and protecting from fire or other damages are materially simplified.

For a long life, with low first cost and upkeep expense, pleasing lines and general desirability, a steel skeleton set on 8-in. concrete foundation walls, with flat roofs carried on beams, free of trusswork of all kinds, and covered, sided and partitioned with hy-rib and 2-in. cement plaster, is the solution. This construction requires no painting on the outside, is bright and cheerful on the inside, easily heated, cooled, cleaned or fumigated, is vermin-proof and fireproof, and in every way gives a combination ideally suited to the coal mine.

Foundation walls should be continuous and rise 12 in. above the highest grading on which the building is to stand, with a 6-in. vitrified tile drain placed outside of and along the base below the frost line.

Barrett specification roof laid direct on the plaster is recommended. The Sturtevant hot-blast system of heating and ventilating is of the simplest and most efficient variety. The hot-blast fan may be set on an elevated platform over the draft fan in the boiler room and driven from a secondary pulley keyed on the draft-fan engine shaft.

This system furnishes fresh warm air under perfect control, the apparatus is under the fireman's care and as the pipes carry only air at a low pressure, the risk from freezing, leaks, etc., resulting from steam or hot-water radiators is avoided. The washroom is particularly well served, owing to the uniform temperatures obtainable, the freedom from drafts and the continual replacing of the vitiated air with fresh, resulting in the quick drying of damp clothes.

The lighting should be of the best. Hinged sash placed just below the roof lines throws the light downward, with an even diffusion, the windows being so located that danger of breaking them is minimized. This arrangement, coupled with tungsten bulbs placed where needed, will meet both day and night demands.

Such units as the engine room, boiler room and washhouse, all of which require plumbing, should be placed adjacent to each other, while the shops should be so located that they are lighted from three sides. The building illustrated will house an equipment for a mine with a capacity up to 2,500 to 3,000 tons per day. For a larger tonnage the width may be increased. For unforeseen additions to the original capacity any or all rooms may be lengthened to suit.

To ascertain the size of plant necessary, a great many conditions must be studied. Among these are the average horsepower required by the shaft when hoisting; the number of mining machines to be used and the power required by each; the number of trolley locomotives, weight of trips, grades, etc.; the number of battery locomotives; the number of drills; the number of pumps and the capacity and lift of each; the power requirements of the fan, tipple, boxcar loaders, shops, deep-well pumps, power plant, coal conveyor, ash- and waste-handling systems, town lighting, etc.

THREE POWER SOURCES ARE AVAILABLE

The choice between steam, gas or a public power supply must be made. Strong claims are put forward by electrical engineers and others concerning the many advantages to be derived from purchasing current from a public supply as against manufacturing it at the mine. But before a public-supply contract is signed, the specialists in both gas and steam should be consulted and allowed an opportunity of showing the advantages of their respective powers.

Current is seldom sold at less than from ¾c. to 1c. per kw.-hr. It is invariably metered before passing to the motors, and because of the internal resistance of these machines, part of the current is absorbed in the machine itself. This gives a good motor about 85 per cent. actual efficiency and makes the cost 0.88c. to 1.17c. for each kw.-hr. available for useful work. This is the price that should be considered in any comparison made.

As competition grows stronger, economy in the use of the mine's product will grow greater. The market shows more and more a preference for the smaller grades of coal as new methods of burning them are developed. All this forces the conclusion that, to survive, the operator must install a system in which can be used either byproducts direct or such grades of coal as are unmarketable, preference being given to that arrangement which, other things being equal, can utilize either waste gases from the coke ovens or high-ash coal or bone from the picking tables.

The modern mine is in a position to maintain both day and night loads within fairly reasonable limits. During the day the tipple, fan and pumps offer a uniform load; and by running express trains on schedule, the trolley locomotives may be timed to minimize the peaks as far as possible. During the night the battery locomotives under charge, pumps, fan and lights are uniform, with the mining machines tending to create sudden fluctuations. As both trolley locomotives and mining machines do not have to be contended with on the same shift, but small difficulty should be encountered in handling such peaks as arise, be the power either steam or gas.

In making a comparison between steam and gas for mining work, the capacity of the plant is assumed to range from 400 to 1,000 kw. The gas equipment would then consist of the Smith Gas Power Co.'s updraft producers and cleaning apparatus and the Mather & Platt, Ltd., vertical double-acting valveless engines. A steam plant of the size assumed should embody the best type of water-tube boilers, fitted with superheaters and stokers, and steam turbines driving the electric generators.

COMPARATIVE EFFICIENCIES AND COSTS

In general the efficiency of a modern mine steam plant is somewhat less than that of a gas plant of the same size. A steam plant equipped as specified will cost slightly less than the gas plant, unless byproduct gas from the ovens may be used, doing away with producers, in which case the steam plant would be the more expensive.

Using the same coal- and ash-handling systems, operating costs will be approximately the same. One fireman on each shift can handle either four producers or four boilers, while one engineer can care for the engine room. In each case the gas attendant has the more pleasant job. Boilers require cleaning regularly; producers may go for two or three years without their fires being drawn. The valveless vertical engine gives no more trouble than the steam turbine, while the high-speed turbo-driven generator may be assumed to require more attention than the slow-speed engine-driven unit.

Oil and waste charges will be the same in either case. Depreciation should show in favor of the producer against the boiler and the turbine against the engine, balancing this item. Interest will also be the same. Coal and water costs will be in favor of gas.

Producers meet the requirements of the underwriters, and there is no more danger to be feared from them than from water-tube boilers; both require reasonable care.

There is no gas-storage tank, and the amount of gas contained in the pipes and coolers at any one time is not sufficient to cause a serious explosion, assuming an explosive mixture could get into the line and be ignited. If the water were shut off from the producer for one or two hours, no serious effect would be noticed other than the poorness in the quality of the gas.

A producer is nothing but a circular steel shell with firebrick lining. It has no tubes, is easier to fire than boilers, is much smaller and is more easily maintained.

The gas cleaning equipment of coolers, or condensers, tar and moisture extractors is made up of plain circular tanks, than which nothing could be simpler. The exhauster consists of motor-driven rotors in a heavy housing, smaller in size and just as simple as the draft fan for a steam plant. The piping carries a clean, cool gas at a low pressure, is relatively small, uncovered and requires no special valves or packing.

The turbine is undoubtedly the simplest prime mover obtainable, yet the gas engine designated is a close second in this respect. It has neither admission nor exhaust valves, cams nor gearing. The jackets are not cast on, and there is no danger from cylinder cracks.

Producers are guaranteed for 20 per cent. overload for two hours, and in many cases are run continuously at 50 to 75 per cent. overload. They cannot, however, carry the excessive overloads of 200 to 300 per cent. taken by the modern forced-draft boiler, owing to the high heats generated fusing the ash and requiring an increased amount of manual labor to break the clinker formed. Their range is sufficient, however, to meet the requirements of any well-regulated mine.

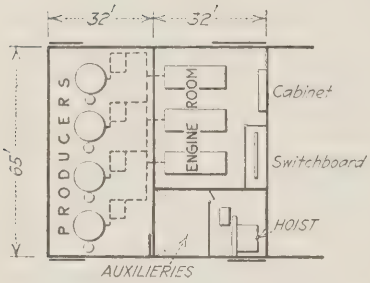

FIG. 4. PLAN OF GAS PLANT

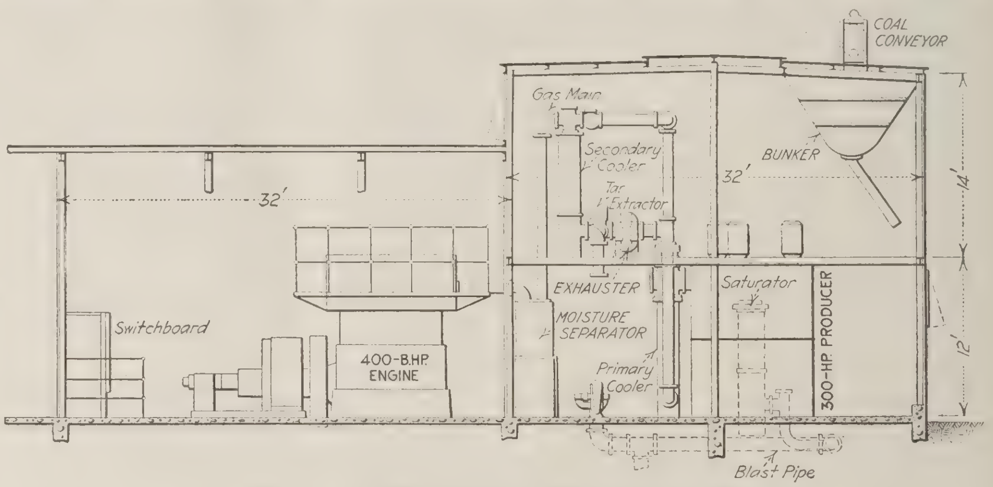

FIG. 5. CROSS-SECTION OF GAS PLANT

Standby Losses Are Less with the Gas Plant

When a producer is shut down the gas outlet to the atmosphere is opened, all inlets to the ashpit are closed, and 5 per cent. of the fuel used for rated load is required to keep the producer in shape for starting. This allows of keeping the fire reasonably hot and starting up in from 45 min. to 1 hr. Producers can stand for an indefinite period, provided coal is charged every 8 hr. to compensate the standby losses.

The lowest grades of lignite and the high-ash bituminous waste can both be gasified and a good efficiency realized. It may be said that, with the use of bone carrying from 25 to 30 per cent. ash, 1 hp. can be delivered from a producer with about the same quantity of fuel that a boiler would require of a good marketable grade.

In a plant such as described the ashes are withdrawn through low ash doors and shoveled to cars. No special system is necessary for the moderate sized plant. Assuming 1,200 hp. at 1½ lb. of poor coal with 15 per cent. ash per horsepower-hour, operating 16 hr. at full load and 8 hr. standby, 15 tons of coal will be used, giving 2½ tons of ashes, or from two to three cars only. The ashes would be withdrawn but once in 24 hr., just before starting up in the morning. When 5 to 10 tons of ashes per day must be handled, any labor-saving system suitable for boilers may be advantageously installed.

Two and one half gallons of water per pound of coal gasified is required for cooling the gas and 4 gal. per brake horsepower-hour for jacket cooling in the engines. One pound of water is required per horsepower-hour for saturating the air used in the producer; this is taken from the engine-cooling system. After passing from the cylinder jackets, the water passes through a heater placed in the engine exhaust line and thence to the saturator.

The total water required for 1 b.-hp. per hr. at 1½ lb. of coal is therefore 7¾ gal. This water can be used over and over again by providing cooling ponds, and the amount needed to make up the loss owing to evaporation would not exceed 3 per cent. of the whole. The water used does not require treatment, and a quality practically out of the question for boilers would be satisfactory.

While the gas-cooling water will gradually accumulate considerable quantities of tar; this does not affect its efficiency nor prohibit it from being used repeatedly if a cooling system is furnished, this system being separate from the one used for the jacket water. The cooling pond required is by no means as large for a given capacity as where exhaust steam from a turbine is to be condensed.

Byproduct Recovery May Be Profitable

Where the fuel consumption reaches a ton of coal per hour, or more, a recovery plant becomes profitable. From 10 to 12 gal. of tar per ton of coal used is recoverable, as well as from 70 to 80 lb. of ammonium sulphate. The latter sells the world over for between $65 and $70 per ton. It is employed as a fertilizer and is especially valuable for the cultivation of beets. No skilled attendant is required for the recovery plant, the receipts from which should go far toward counterbalancing the operating costs of the plant as a whole.

In estimating the amount of sulphuric acid used in the recovery of ammonium sulphate, 1.1 tons of acid per ton of sulphate will be required. The cost of this acid delivered at the plant may be ascertained at the nearest distributing center and will run from $10 to $17 per ton.

Not only is the width of both the producer and the gas-engine room less than that of the boiler and steam-engine room, but the height of the producer room is also materially less than that of the boiler room. The cubical contents of a building to house a steam plant will be about 50 per cent. larger than in the case of a gas plant.

To sum up: At no higher cost the gas plant may be installed in a smaller building; the same output will be realized with less coal to furnish and handle and less ashes to remove. Water may be used that is unfit for steam raising, and where a pond is installed, but a small amount of makeup will suffice to replace the losses due to evaporation. No stack is required, no special foundations, and there is no smoke. The reliability, safety and maintenance are favorable to gas as compared with steam. It would therefore seem that if the loads can be kept anywhere near uniform the gas plant appears an attractive proposition.

Extracts from a Superintendent's Diary

For some time we have felt pretty sure that a labor agent has been enticing our men away, but not until today have we been able to get any positive evidence. Early this morning John Towne, our camp deputy, came by the office and remarked that unless all signs failed he would have a labor agent in the toils before night.

Sure enough, about 2 o'clock he came in, leading a crestfallen-looking individual manacled to him.

John Towne's reputation is so well established in our community that he is never obliged to use force in making an arrest. To offer resistance to him is equivalent to courting a terrible beating, and people who are familiar with his habits are not willing to take chances. The man under arrest was evidently not acquainted with John's peculiarities, as one of his eyes was swollen nearly shut and blood was still flowing from a wound on his right cheek.

It is about impossible to convict a man for the crime of enticing away labor, but it is easy enough to arrest a suspect on some charge and thus get him out of the way temporarily. If the matter is handled cleverly, he will probably have no desire to return. That is the plan our deputy follows whenever he encounters labor agents.

John brought his prisoner into the office and sat him down in a corner in the rear to await the next train for our county seat. While waiting for the time to pass, he procured water and a towel and tried to make the man's face more presentable.

People passing through the office invariably stopped to stare at the stranger, but he seemed to pay no attention to them, nor for that matter to anything that was going on around him. His every action seemed to say: "I am in the hands of the enemy, and no one realizes it more than I do. But I'll be game to the last."

However, he didn't remain game to the last, neither did our deputy.

About an hour before train time my 3-year-old son came over to take a look at his "Daddy," as was his wont on occasions, and he immediately discovered the prisoner at the other end of the office.

He had to get close to him, but he looked him over from head to foot before he opened his mouth; then he started out with questions that demanded answers.

At first the stranger paid no attention to him, but that could not last long. When my boy inquired about his boy, he lost control of himself. "Little boy," he said, "I haven't seen my kids in months, and the good Lord alone knows when I will see them again. I can't hear from their mother because I can't let her know where I am, except when I am in jail, and then I don't want to let her know my whereabouts."

Somehow up to that time it had never occurred to any of the audience that this man was just a human being, but his remarks seemed to change everyone's line of thought.

John Towne was the first to put his thoughts into words. "Say, man," he said, "why in the name of Sam Hill didn't you tell us that you were trying to make a living for a wife and kids?"

As I was leaving the office tonight I noticed John and the stranger walking down the street together, arm in arm, and they were going in the direction of John's home.

They were no longer bound together by manacles, but were bound together nevertheless

French Coal Output in 1914

French coal production in 1914, says *Commerce Reports,* amounted to 29,786,505 metric tons, compared with 40,843,618 tons in 1913. The coal output for the first half of 1914 amounted to more than half of the total production for the year 1913. The detailed figures for the coal-mining regions of France are as follows for 1913 and 1914:

Coal Basins	1913. Tons	1914, Tons
Nord and Pas-de-Calais	27,389,307	17,800,308
Loire and Haute-Loire	3,966,618	3,487,644
Gard and Herault	2,332,091	2,045,378
Tarn and Aveyron	1,974,804	1,810,466
Isere	362,662	317,351
Saone-et-Loire	2,210,091	2,048,200
Bouches-du-Rhone	694,054	619,313
All other	1,913,991	1,657,845
Total	40,843.618	29,786,505

In 1914 France imported from Great Britain 10,759,058 tons of coal, 18,883 tons of coke and 116,549 tons of manufactured fuel (*agglomérés*).

Loyalty via Appreciation

Yes, I work for a man, or rather a corporation, an institution. And I work, as a cog in a great machine—to be sure a small cog, a cog that can easily be renewed by another; but nevertheless while I'm there I help to keep the machine going. Of course the corporation pays me wages that supply my bread and butter—lubrication so to speak, to keep me working smoothly as I do my share to grind out the golden dollars to swell its coffers.

And I do not vilify, I do not condemn, and I do not eternally disparage. I am part of the order of things as they are. But one word I would say:

You man, you institution, who would have the loyalty of your employees, why don't you speak well of them? A pat on the back, a little word of encouragement, a look of appreciation will bind your men to you with threads of loyalty far stronger than chains of tempered steel—a bondage that will not be broken by the lure of higher wages or shorter hours.

An ounce of appreciation is worth a ton—aye, a hundred tons—of browbeating an employee.—Baltimore & Ohio R.R. Co. Employee Magazine.

Accident Prevention During Construction Work*

Probably no other class of work is so productive of accidents as the construction of industrial plants. This is due, primarily, to the fact that the conditions under which the work is done are constantly changing, and that it is generally impracticable to make the working places as safe as they would be made under more stable conditions. Another matter that has a great effect upon the number of accidents is the fact that most construction work is a "rush" job. Foremen and men get out to break records and are keyed up to work at the highest rate of speed, so that the taking of a chance that might cause an accident becomes a matter of comparatively slight importance to them.

Improperly built scaffolding is one of the most important causes of such accidents. Scaffolds are frequently built of any sort of lumber that is quickly available for the purpose, whereas only first-class material that is free from knots should be used.

The proper design of such erections is just as important as that of permanent structures, but in general anything from a single board up that will meet the need of the immediate moment is considered sufficient. Accidents are on record that were caused by a number of ironworkers, who had with them heavy tools and equipment, attempting to use a single-plank staging that had been built for the use of one man who had no heavy tools with him. Scaffolds that are raised 10 ft. or more above the ground should be provided with toe boards to prevent accidents caused by falling tools, and when light swinging scaffolds, such as used by painters, are employed, all tools and materials should be removed from the scaffold when it is not in use.

Keep All the Working Floors Clean

Working floors should be kept as clean as possible, and all permanent openings should be closed in with planking fixed in place, as workmen who may happen to need a plank for any purpose are not particular where they get it and are likely to take any plank that may have been used to cover such an opening if it is not secured in place. These floors should also be made as tight as possible in order to prevent tools and material falling through onto men below. In many cases planks are left so that a man stepping on one end may tip the plank up, and the falls that have been caused by these "traps" are almost innumerable. Those responsible should be disciplined.

Where hoists are used for raising material, the landings should be properly guarded. We have on record an accident that was caused by a man walking under the cage as it was being lowered, no barrier having been provided to prevent him doing so. It is best to close in the sides of the cage or shaft with a solid sheathing, as tools may project and be caught in the framing.

Construction men frequently find electrical wiring that interferes with their work and sometimes handle and move it without proper authority or knowledge of what they are doing. In one case an ironworker held an iron bar against a high-tension wire to find out whether or not it was "live." Fortunately for him, it was not; otherwise he would never have known the difference.

Ironworkers engaged in the erection of steel framing have a particularly hazardous class of work to perform, but in a desire to "show off" some men take chances that are entirely unnecessary. In connection with this work it is also important that the rope slings and tackle that are used should be of the best quality and in good condition. Pieces of rope and cable that have been badly strained and are unsafe for further use are laid aside for the moment until they can be destroyed. Then some man who needs a rope for some purpose comes along and takes such a piece because it happens to be the first thing he sees. He has no knowledge of the condition it is in, and the result is an accident.

When material is being raised and lowered, care should always be taken to keep men away from underneath. A cylindrical tank that was being lowered slipped from the tackle and fell on a man who was working below and caused a serious injury. Many accidents would be prevented if the work were done so that one gang would not have to work below another, and such arrangements should be made whenever possible.

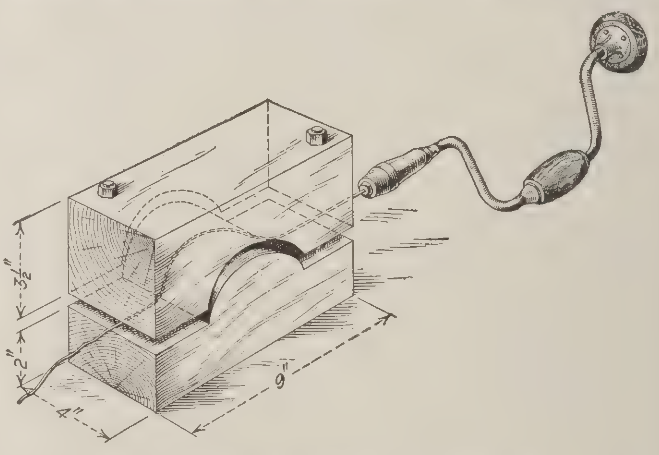
Handy Wire Straightener

By W. C. Eyl*

One is sometimes confronted with the apparently hopeless task of straightening an old, crooked, kinked wire. To many this is no easy job, but to those who become familiar with the straightener here described the problem will be a comparatively simple one.

To make this straightener first procure two blocks of hard wood, each about 3½x4x9 in. Cut the two ends of one piece down from 3½ in. to 2 in. in thickness for a distance of 2½ in. from either end. This will leave a rectangular projection in the center of the piece. Round the two ends of this projection off as shown in the accompanying illustration. Now from the other block and on a 4x9-in. face cut out a concave depression to fit over the curved surface of the other block. Now, placing the two blocks together, bore two holes, one in either end and in opposite corners, as shown in the diagram.



WIRE STRAIGHTENER IN OPERATION

By means of two bolts clamp the two blocks onto the wire to be straightened, near one end. Fastening a brace or something similar to the short end, turn the wire, drawing it through the block at the same time. The result will be a straight wire. This device will straighten a wire of any diameter.

Insuring the Coal Supply

By Henry J. Edsall*

SYNOPSIS—The storage of coal is insurance against either excessive fuel prices or a shutdown. Certain precautions must be observed in stocking bituminous coal, and the means to be employed will vary widely with circumstances, each installation being a separate problem. Many varieties of stocking and reclaiming apparatus are here described.

While it has become almost universal practice among business men to carry insurance against fire, accidents to employees and other possible happenings beyond their definite control, the carrying of an ample coal supply as an insurance against delays or a possible closing down of the plant is apt to be neglected by the coal consumer. The advisability of this kind of insurance is not hammered at him by the insurance man as are the other kinds, and he is apt to have a feeling that he can always get coal somehow, even though there is a shortage.

Every once in a while, however, there is a strike of the coal miners, congested conditions on the railroads, an unusually severe snowstorm, an especially heavy demand for coal, along with a business boom and a car shortage, or something else happens to disturb the equilibrium between the available coal supply and the demand. At such times the prices soar, and the man with a good-sized coal pile pats himself on the back for his foresight, while the one who neglected this precaution is bidding against other consumers, in the same predicament, for enough coal to keep his plant running and to avoid an interruption to business at just the time when business is booming and any delay would be disastrous.

The consumer with ample storage facilities is also in a position to take advantage of special prices which may be offered him at certain seasons of the year or of a special offer of some dealer because of a combination of circumstances affecting him. Better coal can also be obtained at certain times, and the main supply can be laid in under favorable weather conditions instead of having to handle coal all through the winter, with its snow and sleet storms and zero weather.

Where small anthracite steam coal is used, the storage problem is comparatively simple, since the small size makes it easy to handle by machinery, and it can be piled to any depth without danger of spontaneous combustion. Since, however, the majority of the coal used for steam purposes is bituminous, it is this kind as a rule for which storage facilities have to be provided.

Bureau of Mines' Investigations

The United States Bureau of Mines has made some investigations of the deterioration and spontaneous heating of coal in storage and expects to carry on further experiments and publish further data later on. Technical paper No. 16, published in 1912, gives points of information obtained from individuals who have had experience in storing coal under various conditions. It also gives results of tests made by storing different kinds of coal, both exposed to the weather and submerged under fresh and salt water in different localities. The following quotations are from this paper:

> The results show in the case of the New River coal a loss of less than 1 per cent. of calorific value in one year by weathering in the open. In two years the greatest loss was at Key West, 1.85 per cent. There was practically no loss at all in the submerged samples in one year, fresh or salt water serving equally well to "preserve the virtues" of the coal. There was almost no slacking of lumps in the run-of-mine samples. In all tests the crushed coal deteriorated more rapidly than the run-of-mine.
>
> The Pocahontas run-of-mine coal in a 120-ton pile on the Isthmus of Panama lost during one year's outdoor weathering less than 0.4 per cent. of its heating value and showed little slacking of lumps.
>
> Gas coal during one year's outdoor exposure suffered practically no loss of calorific value, measurable by the calorimetric method used, not even in the coal forming the top 6-in. layer in the bins.
>
> Submerged storage is an absolute preventive of spontaneous combustion, and on that account alone it may be justified when the coal is particularly dangerous to store and when large quantities are to be stored; but unless the storage period is to be longer than one year, there seems to be no ground for storing any coal under water merely for the sake of the saving in calorific value to be obtained by the avoidance of weathering.
>
> Losses of value from spontaneous heating are a much more serious matter than the deterioration of coal at ordinary temperatures. Oxidation proceeds more rapidly as the temperature rises. The oxidation, beginning at ordinary temperatures, attacking the surfaces of particles and developing heat is probably in some degree an absorption of oxygen by the unsaturated chemical compounds in the coal substance. In a small pile of coal this slowly developed heat can be readily dissipated by convection and radiation, and very little rise in temperature results. If the dissipation of the heat is restricted, however, as in a large pile densely packed, the temperature within the pile rises continuously. The rate of oxidation of the coal platted against the temperature makes a curve that rises with great rapidity. When the storage conditions are such as to allow warming of the coal to a temperature of about 100 deg. C., the rate of oxidation becomes so great that the heat developed in a given time ordinarily exceeds the heat dissipated, and the temperature rises until, if the air supply is adequate, the coal takes fire. Evidently, therefore, it is important to guard against even moderate heating of the coal, either spontaneous or from an external source. Increased loss of volatile matter and of heating value occurs with a moderate rise of temperature, even though the ignition point is not reached.
>
> Spontaneous combustion is brought about by slow oxidation in an air supply sufficient to support oxidation, but insufficient to carry away all the heat formed. The area of surface exposed to oxidation by a given mass of any one coal determines largely the amount of oxidation that takes place in the mass; it depends on the size of the particles and increases rapidly as the fineness approaches that of dust. Dust is therefore dangerous, particularly if it is mixed with lump coal of such a size that the interstices permit the flow of a moderate amount of air to the interior. Coal differs widely in friability; that is, in the proportion of dust that is produced under like conditions. In comparative tests samples of Pocahontas, New River and Cambria County (Pennsylvania) coals produced nearly twice as much dust (coal through a ⅛-in. screen) as coal mined from the Pittsburgh bed in Allegheny County, Pennsylvania. This variation in friability is a factor in affecting the liability to spontaneous heating.
>
> Ideal conditions for such heating are offered by a mixture of lump and fine coal, such as run-of-mine with a large percentage of dust, piled so that a small supply of air is admitted to the interior of the pile.
>
> High volatile matter does not of itself increase the liability of coal to spontaneous heating. A letter of inquiry sent by the bureau to more than 2,000 large coal consumers in the United States brought 1,200 replies. Of the replies 260 reported instances of spontaneous combustion, and 220 of the 260 gave the name of the coal. The 220 instances were distributed as follows: 95 were in semibituminous low-volatile coals of the Appalachian region, 70 in higher-volatile coals

of the same region and 55 in western and middle-western coals.

Freshly mined coal and the fresh surfaces exposed by crushing lumps exhibit a remarkable avidity for oxygen, but after a time the surfaces become coated with oxidized material, "seasoned" as it were, so that the action of the air becomes much less vigorous. In practice, coal that has been stored for six weeks or two months and has even become already somewhat heated, if rehandled and thoroughly cooled by the air, seldom heats spontaneously again.

OVERHEAD STORAGE USED WITH MECHANICAL STOKERS

Where mechanical stokers are used, it is almost universal practice to provide an overhead storage bin for at least part of the coal supply, this bin being located either right in the boiler room or at a convenient point close by. This coal is either spouted direct to the stoker magazines or drawn from the bin into a traveling larry or weighing hopper running on an overhead track above the stokers, the coal being delivered from the larry to the magazines.

Where the firing is done by hand, the coal is shoveled from the floor or from a charging car, so that the overhead bin does not show such a decided advantage over a ground-storage bin. The overhead bin is often used, however, for the sake of neatness and on account of the possibility of arranging it so that the greater amount of the coal can be spouted by gravity to convenient points within easy reach of the fireman without having to keep a lot of coal on the boiler-room floor or constantly bringing it in from the outside.

Without the overhead bin it is customary either to pile the coal against the outside of the boiler-room wall, in front of the boilers, and leave openings in the wall so that it will flow through onto the floor within easy reach of the fireman, or to pile it at as convenient a point as possible for transfer to the boiler room.

On account of the expense of construction the amount of overhead storage is usually kept down to what is considered a minimum for satisfactory operation, and some cheaper type of storage is arranged for the reserve supply, with a means of transfer from the reserve storage to the active storage.

The justifiable amount of investment for reserve storage and transfer facilities depends on the size of the storage that is considered advisable, on the amount of coal which will be delivered to the storage and transferred from it in a certain time and on local conditions. In some cases coal is as a rule received regularly, and the reserve supply is simply an insurance against unusual contingencies, to be called on only at infrequent intervals. In such cases it may pay better to use hand labor partly or entirely for the storage and transference rather than to invest much money to eliminate this hand labor when it does not figure as a large yearly expense. In other cases the coal supply may be so irregular that it is necessary to call on the reserve storage at frequent intervals, and the amount of hand labor which it is possible to eliminate justifies quite a large investment.

RUN-OF-MINE COAL IS USUALLY CRUSHED

If the coal is received as run-of-mine and is to be used in mechanical stokers, it is usually passed through a crusher before it is delivered to the stokers. At small plants it is sometimes passed through a grating over a feeding hopper or the large lumps are broken up in some other way, instead of the expense being incurred of installing a crusher with its driving arrangement. Where the coal is to be fired by hand the crushing is not considered necessary as a rule; but if it is to be handled by machinery, it must be crushed or the machinery must be made capable of handling the largest lumps.

When a crusher is used it can be placed at the receiving point, so that the coal is passed through it as soon as it is unloaded and before storing. On the other hand, if a reserve storage is employed, the coal may be stocked as run-of-mine and passed through a crusher just before it goes into the active storage for the boiler room.

This means collecting from the reserve storage and bringing all coal to the fixed point where the crusher is located, unless this machine is made to move along on wheels, as is sometimes done. Where the coal is handled entirely by conveyors, it simplifies the problem to crush it first, so that it is easier to handle, though this necessitates the storing of crushed coal in the reserve supply as well as in the active storage.

THE RESERVE STORAGE MAY BE RUN-OF-MINE

Where a grab-bucket arrangement is used for the reserve supply, it is usually just as easy and sometimes easier to make this a run-of-mine storage and crush the coal just before it goes into the supply for the boiler room. Since the coal mines are fast becoming equipped with screening and picking arrangements for sizing and preparing the coal, it is now entirely feasible to buy coal of the size required for use, though the sized coal costs a little more than the run-of-mine.

In considering the different types of reserve-storage plants, the simplest case is undoubtedly that where a moderate amount is unloaded from railroad cars and piled on the adjacent ground without any provision for reclaiming mechanically. The most economical machine for this work is a chain-and-bucket elevator or an inclined scraper conveyor, technically known as a flight conveyor. A pit is built under the railroad track at the unloading point so that the coal can be discharged from hopper-bottomed cars into the pit and fed through a gate to the elevator or conveyor. With the elevator the buckets pick the coal up, elevate it and discharge it at the head to a chute to the pile. With the inclined conveyor the flights scrape the coal up in a steel trough and discharge it in a similar manner at the head.

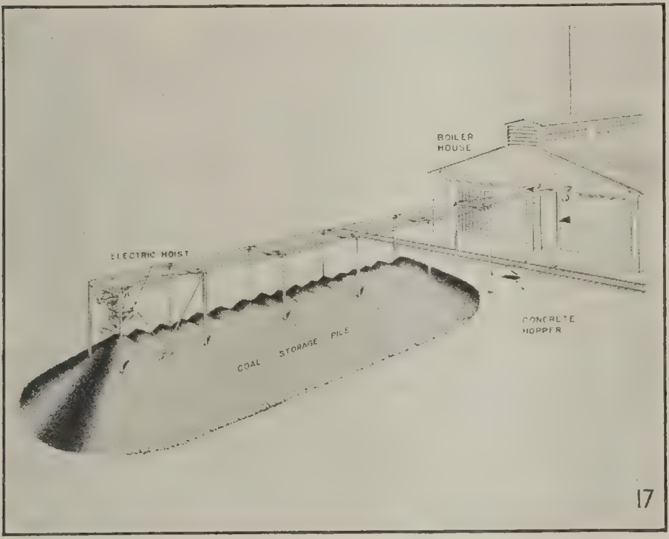
The coal can be handled as run-of-mine or a grating can be placed over the track hopper and the larger lumps broken on it, thereby making it possible to use a somewhat smaller and cheaper equipment. For a pile of 500 or 600 tons, the machinery, including a motor for driving, can be purchased for about $600; and in addition to this there will be the cost of the pit and machinery supports, also the cost of installing the equipment. Machines of this kind usually handle coal at the rate of about 30 or 40 tons per hr., providing the coal can be unloaded from the cars at this rate. This depends on the type of railroad car, the percentage of lumps in the coal and the number of men used to unload the cars.

Where a cart is available for hauling the coal to the boiler room or where it can be transferred by small industrial cars, a portable wagon loader is an excellent way to pick it up from the ground. A standard machine of this type will handle anthracite or run-of-mine bituminous coal at the rate of a ton a minute. They are built both hand- and power-propelled, the hand-propelled machines costing about $550 and the power-propelled ones $850, complete with electric motor or gasoline engine for operation.

Fig. 1 shows a bucket elevator delivering to a ground-storage pile and a portable wagon loader handling the coal from this storage to carts. Fig. 2 shows an inclined flight conveyor handling coal from the railroad cars to a ground-storage pile, the pile in this case being adjacent to the boiler room so that part of the coal flows through openings in the boiler-room wall to the floor directly in front of the boilers.

A Conveyor May Both Store and Reclaim Coal

By going a step further and adding a reclaiming feature, a conveyor can be made to deliver the coal to the storage, also take it from the storage and deliver it at a desired point. For this work a gravity-discharge type of machine is often used because it will both elevate the coal and convey it along horizontally or at an incline, and by bringing the buckets back in a tunnel underneath the pile, the same machine can be used as a reclaiming conveyor. These machines have V-shaped buckets carried between two chains and properly attached to them. When elevating, the coal is carried up in the buckets. When it is being conveyed, the buckets act like the flights of a flight conveyor and push it along in a steel trough, through which it can be discharged at the desired points by means of gates.



THE CLAMSHELL BUCKET AND MONORAIL STORAGE

Fig. 3 shows an arrangement like this for handling coal from railroad cars and delivering either to a small overhead bin or to a ground-storage pile, also taking from the pile and delivering to the bin. The conveyor encircles the bin and pile, the lower run being located in a tunnel underneath the pile. When the stored coal is wanted, it is fed through gates to the lower run of the machine and taken up to the pocket. In this case there are three boiler rooms in the plant, and the coal is loaded into carts and delivered to the boiler rooms in this way.

A Combination Is Often Employed

Frequently in piling coal a combination of bucket elevator and flight conveyor is used, the elevator taking the coal up to the proper height and the flight conveyor distributing it along in a pile of any desired length that is not excessive for a conveyor. A combination of this kind is shown in Fig. 4. The maximum depth of the coal is about 18 ft., and the length of the conveyor is 200 ft.

Without resorting to hand-trimming of the coal—that is, simply allowing it to take its natural slope as it is discharged from the conveyor—it is possible to store about 3,000 tons of anthracite coal or 2,000 tons of bituminous, the difference being due to the difference in the natural slope of the two kinds of coal. This sort of an arrangement is quite similar to a railroad-trestle storage, but is much cheaper in first cost as well as in maintenance and depreciation, unless the railroad trestle is built of permanent and therefore expensive construction.

Where the reserve storage is at some little distance from the boiler room, a flight conveyor in combination with a gravity discharge machine with the reclaiming feature is sometimes used. The gravity-discharge elevator-conveyor takes the coal up and delivers it to the flight conveyor for immediate transfer to the boiler room or delivers it to the storage pile. The stored coal can be taken from storage, the same as in Fig. 3, but in this case it is delivered to the flight conveyor, which serves instead of carts to transfer the coal to the boiler room.

This kind of an arrangement is shown in Fig. 5. In this plant the amount of coal consumed per day is about 20 tons, and the amount that can be stored is about 600 tons, or 30 days' supply. Fig. 6 shows a somewhat similar arrangement. In this case the elevator is located about 65 ft. from the end of the boiler room, and the space between it and the building is used for storage, being served by the flight conveyor to the boiler room.

In the opposite direction there is a flight conveyor encircling the pile and having a horizontal length of about 150 ft. When coal is being delivered to this pile, it is elevated by the elevator and carried out on the upper run of this flight conveyor. When it is being taken from the pile, it is fed to the lower run of the flight conveyor in a tunnel underneath the pile, delivered to the elevator, then taken into the boiler room by the other flight conveyor. As the firing is done by hand the coal is simply deposited on the boiler-room floor.

A Pit May Be Used for Storage

The arrangement shown in Fig. 7 is for small anthracite coal. The storage space was excavated so as to form a pit, the coal being stored in the pit and also piled up above the regular ground level. Over 11,000 tons of coal can be stored at this plant, and all except a little that is used in some boilers in an adjacent building is carted to the main boiler room of the publishing plant, a mile or so away. The machinery includes a gravity-discharge elevator-conveyor, a stocking-out flight conveyor and two reclaiming flight conveyors in tunnels under the pile. The gravity-discharge machine elevates the coal and delivers it to the wagon-loading pocket or to the pile, and also transfers coal from the pile to the pocket. The stocking-out conveyor serves to pile the coal on out in the storage area away from the pocket, and the reclaiming conveyors take it from points out of reach of the gravity-discharge machine and transfer it to this machine. The rate of handling is about 40 tons per hr.

For low maintenance cost and reliability the pivoted-bucket carrier type of conveyor excels all others for handling coal, ashes and similar materials. Some makes of these machines have been carefully perfected, so that they represent a high degree of development in the conveying art. With this type of machine the material is carried along in the buckets, which do both the elevating and distributing. The material is discharged by tilting the buckets with a tripping arrangement at the desired points, and the weight of chains, buckets and coal is supported on the horizontal runs by large well-oiled rollers traveling on T-rails. These rollers are confined between T-rails on the vertical runs, so as to guide the chains and buckets.

Two ways of using these machines in connection with reserve storage are illustrated in Figs. 8 and 9. The former has overhead-storage bins directly over the reserve storage, with the carrier encircling both the overhead and ground storage, also encircling an ash pocket. When the overhead storage is depleted, the coal in the reserve storage can be fed to the lower run of the machine and transferred to the overhead bins.

With a reliable machine of this kind to transfer the coal, the overhead-storage can be made quite small and the first cost thereby reduced. Even though the replenishment of the overhead supply is dependent on the frequent operation of the carrier, there is little danger of lack of coal in the overhead bins owing to trouble with the machinery, as breakdowns with a first-class carrier are almost unknown, and repairs which may be necessary at long intervals can be made with little or no delay in the operation.

The other design is quite similar to this, except that the main or reserve supply in this case is placed in a bin at one end, instead of being underneath the overhead bins. This particular carrier has a horizontal run of about 275 ft. and a vertical lift of about 42 ft., or a total length of about 630 ft. Only a little over 8 hp. is required to operate it.

Conveyors Are Cheaper Than Trestles

In many cases, and probably in most cases, where railroad trestles are built for storing coal, a better and less-expensive arrangement could be obtained by having the railroad track at ground level and using conveyors to elevate and distribute the coal; and where an overhead supply is desired, the conveyors can usually be arranged to transfer the reserve coal to the overhead bins. A case where the design was changed from a railroad trestle to a conveyor arrangement is shown in Fig. 10.

The railroad track comes in at a level considerably above the boiler-room floor and the coal-storage area, and it was the intention to continue the railroad track out on a trestle so that the coal could be dropped underneath for the reserve storage and delivered to a conveyor arrangement which would deposit it in a bin in the boiler room for the supply to mechanical stokers.

It was found, however, on further investigation, that the conveyor arrangement, illustrated in Fig. 10, would be cheaper in first cost and would handle the coal more automatically so that there would be less labor cost, and the amount of storage was also largely increased over that which could be conveniently obtained with the trestle. The distributing conveyor takes the coal out along the light trestle and delivers it to the ground storage or takes it directly into the boiler room and delivers to a conveyor over the overhead bin. A feeder is provided at the track hopper to feed the coal regularly to the distributing conveyor, and provision is also made for a possible future crusher installation, though for the present it is the intention to purchase coal already sized.

Underneath the coal pile is a concrete tunnel with a reclaiming conveyor to which the reserve coal can be fed and taken up to the conveyor over the boiler-room bin. The delivery from the overhead bin to each of the three mechanical stokers includes an automatic-weighing hopper which will automatically weigh all the coal which is delivered to each boiler. The capacity of the overhead bin in the boiler room is about 120 tons, and about 2,000 tons can be stored in the outside reserve storage. The daily coal consumption of the plant is about 60 or 70 tons.

In Fig. 11 is illustrated what might be called a combination active and reserve storage all in one, since the overhead bin is made very large instead of putting part of the coal in an outside reserve pile. This of course is expensive construction, but in this case appearance was an important consideration, and an outside coal pile would have been considered unsightly.

The overhead bin is really a large room on the second floor, extending the full width of the boiler room. It will hold in the neighborhood of 5,000 tons of coal. The amount consumed per day is about 60 tons, so that the storage should last nearly 80 days. While this coal is all stored overhead, on account of the large area of the bin there would be a considerable percentage of it which would not flow out of the chutes without being trimmed over to them by hand.

There is also the danger of spontaneous combustion with such a large and deep pile, and steam pipes have been built into the coal bin so that live steam can be discharged into the coal pile in case of fire, though the effectiveness of this method of providing against fire has yet to be proved.

Both the coal and ashes are handled by a single pivoted bucket carrier, with a feeder and crusher at the track hopper, so that the machinery arrangement is about as simple and ideal as it is possible to make it. The handling of the ashes and feeding them to the conveyor are all done in the basement, so that the dirt and confusion of this operation are avoided on the boiler-room floor. This secures about as neat and shipshape a boiler room as it is possible to get.

Weighing Hoppers Are Often Used

Coming now to the equipment, which includes a self-filling bucket for handling the reserve coal, Figs. 12, 13 and 14 show boiler rooms with overhead bins and traveling weighing hoppers for handling the coal. Fig. 12 has the bin outside the boiler room, with chutes through the wall to a 2-ton weighing hopper. As the coal is unloaded from railroad cars it is passed through a crusher and then taken up to the distributing conveyor over the bin by means of a double-strand bucket elevator.

The distributing conveyor delivers either direct to the overhead bin or to a traveling chute which can be moved along the roof of the bin and which discharges the coal into a pile along the railroad trestle. When the reserve coal in the outside storage is to be reclaimed, this is done by means of a clamshell bucket on a standard-gage locomotive crane, the coal being picked up and delivered to the track hopper for transfer to the overhead bin. Fig. 13 shows a storage on a water-front property, the coal being unloaded from boats by means of a locomotive crane equipped with a clamshell bucket and then transferred by means of a weighing car or larry, which is pushed by the crane, the car delivering either to the outside storage or to a track hopper for transfer to the bin in the boiler room.

From the track hopper the coal is fed by means of a reciprocating feeder to a crusher, and then goes to a pivoted bucket carrier which runs up an incline and delivers to another pivoted bucket carrier that distributes the coal in the overhead bin. The weighing hopper in the boiler room has a platform near the floor upon which the operator can ride, but which is near enough to the floor so that he can easily get up and down any time he wishes.

Fig. 14 shows an outside reserve storage served by a locomotive crane traveling on a circular track. When the coal is unloaded from the railroad cars, it either goes through a crusher and up into the overhead bin in the boiler room or into a pit alongside the track hopper, from which the clamshell bucket picks it up and delivers it to the outside pile. When it is being reclaimed, it is handled from the pile back to the track hopper and up into the bin. This makes an excellent type of locomotive-crane storage.

Fig. 15 shows the possibility of using a locomotive crane on a track along a wharf and piling the coal directly back of the railroad track as it is unloaded from boats. In this case there is a conveyor to the boiler room at one end of the storage area, and the coal is either taken out of the boats and delivered directly to the receiving hopper for the conveyor, or if it comes from the storage it is picked up from the area near the receiving hopper and delivered to it without moving the crane, or if this area is all cleaned up, as is frequently the case, the crane takes the coal from farther along the wharf and travels with it to the receiving hopper.

This is not such a slow operation as it might seem, as the crane has a traveling speed of from 400 to 500 ft. per min., so that it can go 200 ft. down the wharf and back in a minute or less; and with this as an average length of travel, a rate of 30 tons per hr. could easily be obtained with a 1-ton bucket.

When a large storage capacity for soft coal is desired, say over 5,000 or 10,000 tons, the cheapest way to obtain it is to use a large radius locomotive crane and store the coal in a circular pile, as shown in Fig. 16. This shows a crane with 100-ft. radius traveling on a double circular track with 20 ft. from center to center of the two tracks. With one circular track for the crane and a pit at the center for the buckets to take the coal from, it is possible by this method to store over 70,000 tons of coal. The buckets ordinarily used with a crane of this size will hold 3½ tons, and handling-capacities as high as 240 tons per hr. have been obtained with them.

Storage by Clamshell Bucket and Monorail Trolley

Clamshell buckets handled by electric hoists running on overhead monorail tracks have been used more or less for storing coal and taking it into the boiler room. Such a machine is shown in Fig. 17. The operator travels along with the electric hoist in a small cage and controls both the hoisting and the traveling motors. The coal is picked up from a pit to which it is discharged from the railroad cars and taken either directly into the boiler room and delivered into the stoker magazines or piled on the ground underneath the monorail track.

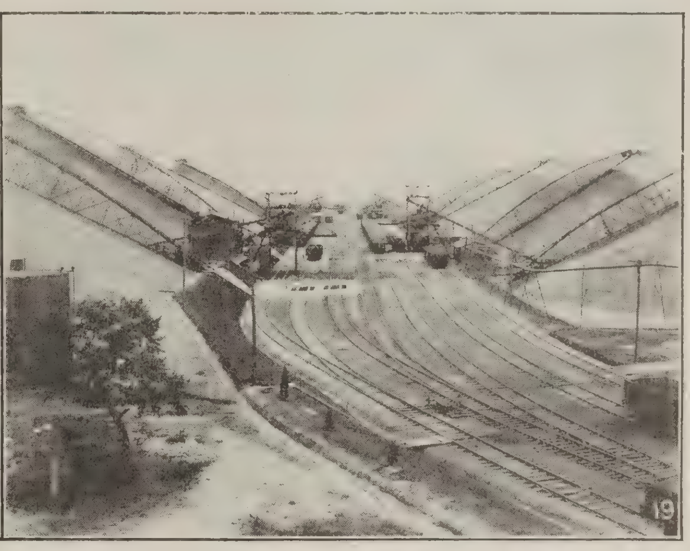
THE SHADYSIDE PLANT OF THE NEW YORK EDISON CO. OPPOSITE NEW YORK CITY



19

PHILADELPHIA & READING COAL AND IRON CO. STORAGE PLANT AT BRIDGEPORT, PENN.

This makes a simple, and usually not very expensive type of storage and delivery to the boiler room, but it necessitates keeping an operator continuously at work handling the coal, and if there is any trouble with the hoist or the operator is not there all the time it means getting the coal in by hand.

This arrangement also complicates the crushing of the coal if it is to be received as run-of-mine and crushed before it is delivered to the stokers. A crusher can of course be placed under the track hopper, so that the coal will go through it before it goes to the pit and then to the boilers, or to the outside storage, but this necessitates a deep pit unless the local conditions are such that the track is elevated.

The storage plant of the New York Edison Co., at Shadyside, N. J., across from New York City, is shown in Fig. 18. This plant has two 100-ft. radius locomotive cranes and a cable railway for distributing the coal along the length of the plant and taking it back. It also has both unloading and loading machinery for transferring the coal from and to boats. The storage capacity of this plant is 225,000 tons.

DODGE SYSTEM IS ADVANTAGEOUS WITH ANTHRACITE

For storing sized anthracite coal on a large scale, by far the most successful method is by means of the well-known "Dodge system," wherein the coal is piled in large conical heaps by conveyors running up inclined trusses and the reclaiming is done by pivoted conveyors which are swung around at the ground level on circular tracks and take the coal back and deliver it to the railroad cars. The Philadelphia & Reading Coal and Iron Co.'s plant of this type at Bridgeport, Penn., is shown in Fig. 19.

This plant has a capacity of 480,000 tons of coal in eight piles. The capacity of the stocking-out conveyors is 1,800 tons per day of 10 hr., or a total stocking-out capacity of 14,400 tons per day. There are four reloading conveyors with a capacity of 2,500 tons per day each, or a total capacity of 10,000 tons per day, or 10 hr.

In designing a reserve-storage plant the local conditions and requirements have to be studied carefully, as each installation is a different problem. There are also almost unlimited combinations of different types of machines to obtain the results desired, so that expert knowledge and long experience are necessary in order to select the type of plant which will give the best satisfaction and which will be cheapest in the long run.

Pages from a Miner's Notebook: Prohibition and Coal Mining

I am not a prohibitionist, neither do I patronize the saloon. Therefore, perhaps, I am qualified to set down here impartially an example of the evil (?) which will be wrought by the eventual closing of the saloons by laws enacted at the behest of pestiferous meddlers.

During the day Jim Bates is a miner. His place is close to mine—so close in fact that I often hear the heated words that pass between Jim and the pitboss and frequently catch a glimpse of the troubled face of the latter official after one of his many daily visits to Jim's place.

During the night Jim Bates is chief oracle at the bar of the saloon. There is no argument for the liquor traffic which Jim hasn't at his tongue's tip and which he will not hesitate to advance, under stimulus of a drink or two, in a loud voice for the edification of those who occasionally patronize the place.

There is nought but evil in prohibition, according to Jim. And he can prove it. He can prove it to the satisfaction of the bartender who plies him with drinks "on the house" and after an evening's session has proved it to himself as he staggers home.

Night before last there must have been an extra hard-headed bunch for Jim to convert. He went directly from the mine to the saloon, where he stayed until the place closed. With some three hours' sleep and with the grime of the previous day still visible on all but the high spots, he went to work yesterday morning. I argued with him that he was in no condition to enter the pit. He was shaking with racked nerves, his tongue was thick and his eyes were cloudy, but my arguments were in vain.

I heard the pitboss call him down, not roughly or unkindly, but with a stinging sarcasm that was lost upon the alcohol-soddened brain. Then there were instructions as to a prop Jim should set immediately. The pitboss left, and Jim kept on loading the car. In another minute or two I heard a fall. Three of us lifted the rock from Jim's unconscious body. Four of us carried him home.

Today an unofficial committee solicited funds to buy Mrs. Jim a wash-boiler, tubs and soap and a supply of groceries to last until she can take in a few washings.

Jim, with a wrenched back and broken leg and arm, will have the best of care and the family will not suffer even though there isn't much washing to be had, as a considerable fund was raised.

Many of the men gave five dollars and pledged themselves for more if necessary. The proprietor of the saloon grudgingly gave 50c. It may be that he was engaged at the time in pondering the "evils" that will befall him should nation-wide prohibition become established.

Ballads of a Coal Miner--IX

Written expressly for Coal Age

Peace

BY BERTON BRALEY

Six weeks of strike an' now the row is ended,
We're back to work an' gettin' out the coal;
Our leaders say our victory is splendid
An' things is rather better, on the whole—
But say, somehow the whole blame thing seems foolish
With all its loss an' trouble, wrath an' hate;
If only people wouldn't be so mulish
There wouldn't be no strikes—we'd arbitrate.

If men could only learn to KNOW *each other*
An' realize each other's point of view,
Instead of lettin' prejudices smother
Their common-sense the way they seem to do;
If boss an' men would only get together
As human bein's, not as bitter foes,
We might be done with fightin' hell-fer-leather;
We might have peace—we need it, heaven knows!

BUT NO, *the owners think we're only cattle; we think they're worse than tyrants of the past;*
An' so the row goes—battle after battle, strike after strike—an' will go, to the last.

Steel Mine Timbering

By Samuel Fray, Jr.

The consistent application of steel to mine timbering in the United States dates from 1907. It is conservatively estimated that in the year 1914 steel mine timbers of various kinds were utilized to timber 20 mi. of headings, and this despite the fact that the year 1914 was by no means an active one in the coal-mining industry.

Among the large operators in the bituminous coal fields of western Pennsylvania is W. J. Rainey, with general offices at Uniontown. This company operates seven slope and drift mines and four shaft mines. Its output of bituminous coal is about 3,000,000 tons per year, much of which is utilized in the manufacture of coke.

Within the last three years this company has installed some 2,200 sets of steel mine timbering in approximately 2 mi. of headings. Installations are to be found in several mines of this company, but the views herewith may be considered as representative of practice in this district. They were taken in the Royal Works mine, Fayette County, Pennsylvania.

Fig. 1 shows an underground mine stable. This houses 38 horses and mules. It is not a temporary makeshift, but a structure intended for permanent use and convenience and compares favorably with first-class structures on the surface.

The stable is constructed alongside the main haulage way. The roof is carried on 12-in. I-beams, between which are sprung concrete arches. The ends of the beams rest on concrete side walls. About middle length 4-in. steel H-beam posts are placed under each I-beam roof support. These posts serve as a partial support to the roof beam, and also form the back part of the stalls, which are separated by concrete partitions. The broad flanges of the H-beam permit concrete to be molded between them, thus insuring permanent anchorage. The stable shows, both from a sanitary and a mechanical point of view, the progressive character of the management and its endeavors to make underground conditions for both men and animals as favorable as those on the surface.

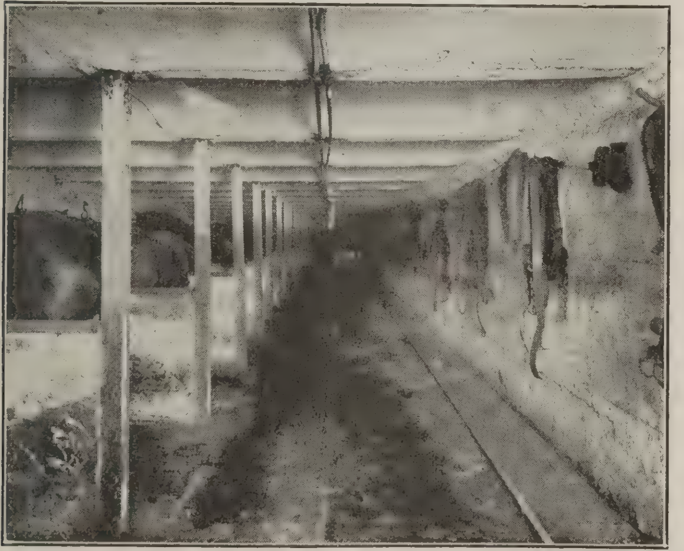

FIG. 1. STEEL TIMBERING IN AN UNDERGROUND STABLE

Fig. 2 shows a portion of the double track main haulage way. This is 18 ft. wide and 8 ft. in height. It is framed with three-piece gangway sets consisting of 12-in. steel I-beam collars and 5-in. H-beam posts, the latter resting on concrete side walls. The collars are separated by wood spacers and lagged overhead by plank. Trolley wires are fastened to the I-beam collars by Ohio Brass Co. trolley-wire hangers, particularly designed for the attachment of trolley wires to steel timbers. The power lines and light wires, as shown in the view, are attached to collars and posts on wooden insulator blocks secured by hook-bolts.

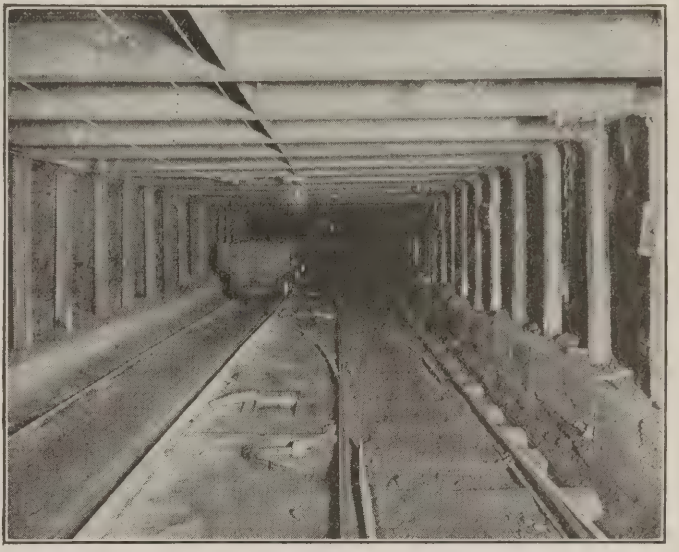

FIG. 2. A PORTION OF THE DOUBLE-TRACK MAIN HAULAGEWAY

The appearance of this main haulage way commends itself to mine superintendents desirous of excellence in mine timbering. One is impressed also by the great contrast in the amount of labor connected with the placing of such sets as compared with the handling of the large sticks of wood timber of sufficient strength to serve for the proper support of the loads carried by the steel timbering, and also with the security which results from the omission of a center line of posts which would probably have been necessary if the haulage way had been framed in wood.

The installation at the Royal Works reflects great credit on the management. The expenditure for steel has proven beyond question a satisfactory and economic investment.

BY THE WAY

The man who laughs outside when he is crying inside, who wears a smile on his face when tears fill his heart, has mastered the greatest of all arts—self-control.

⁂

Some coal-mine officials have one kind of religion for Sunday and a different brand for Monday. The only kind that's worth while is the kind we can wear every day in the week.

⁂

Every man who has attained great heights has been an idealist; for if he were not, his ultimate aim or goal would soon have been reached and the race finished. There must always be a further outlook on the highway leading to success.

The Labor Situation

SYNOPSIS—An uneventful meeting of the Shamokin district of the United Mine Workers of America was held at St. Clair, Penn. The miners declare that the Colver wage rate cuts heavily on the scale adopted for central Pennsylvania. The miners in Ohio are now working more steadily except in the mines of the Sunday Creek Coal Co.

On Oct. 19 the delegates from district No. 9 of the United Mine Workers of America met in the Columbia hose company hall at St. Clair, a small town near Pottsville, Penn. This meeting while large did not arouse much interest because the tridistrict convention had already been held, and consequently none of the matters brought before the district had reference to the threatened strike.

Of course the usual resolutions were passed calling for a pardon for Patrick Quinlan, the labor leader of New Jersey, and another blaming John D. Rockefeller, Jr., for the conditions in Colorado and asking that the report of the Industrial Relations Commission be published in full. But the important resolution was one in which it was proposed to hold meetings biennially instead of annually and to elect the officers of the union for two years. This is intended to save much unnecessary expense. After much discussion the matter was referred to the committee on the constitution. It was eventually decided to make the election of officers biennial, and the president will hereafter draw $167 a month and expenses.

A resolution called for the separating of district 9 from the tridistrict organization, but that motion was declared unconstitutional. The Butler controversy, which has been carried to the courts and made the subject of injunctions, seems to have lost some of its bitterness. A resolution was submitted stating that the district officers had erred in taking up the case against Butler and containing a clause forbidding the district from using any further money in the matter. It was tabled by a large vote. The convention concluded its session on Saturday, Oct. 23.

Miners Raise Salaries and Honor Their Founder

The miners who are demanding an increase of wages of 20 per cent. took a dose of their own medicine and voted the officials of the organization 10 per cent. increase and the two stenographers 20 per cent. For efficient service in preparing for the opening of the convention, during which the force worked overtime, these ladies were granted an allowance of $25. The miners, it will be remembered, are asking in their third demand for time and a half for all overtime and double time on Sunday and holidays. They showed in this vote an excellent disposition to do as they are done by.

A wreath was placed by the delegates to the convention on the grave of John Siney, Sr., the man who is regarded as the founder of the union. He was a resident of St. Clair and his family still lives in the town. His body was interred in St. Boniface cemetery at that place. District President Matthews made an address, followed by Daniel Duffy. A monument was long ago erected to John Siney, this tribute to his memory being unveiled on Nov. 1, 1888.

The convention decided to publish the by-laws of the district in Polish, Slavish, Lithuanian, Greek and Italian, as 87 per cent. of the members are of alien extraction. Though at one time Butler declared that the convention was "packed," meaning not representative, in the end harmony prevailed, and everyone is working to further the progress of the union. The convention next year will be held at Mt. Carmel, Penn.

Colver Scale Said To Be Lower Than Union Rates

The Colver mines are working steadily, but the union leaders continue to make complaint that the wages paid by the Ebensburg Coal Co. need upward revision. In a reply to General Manager E. S. Saxman, Charles O'Neill, the vice-president of the district, states that the district price for pick mining is 72c. per ton and the price at Colver is only 52c.; that cutting by machine and loading should be paid for at the rate of 56c. per ton, whereas at Colver the rate is 47c.

The district price for inside day labor is 33c. to 42c. per hr. At Colver that hourly rate is only 25c. to 30c. However, the rate for loading after machines is 42c. in both Colver and in mines working under the district scale. O'Neill claims that there is no checkweighman on the tipple. He declares that because of the low rate paid and the reopening of union mines nearby, the village of Colver has now 60 idle houses and has lost 400 miners.

The miners in Ohio are for the most part at work. The operators slowly and with no great degree of good grace have put in the weigh scales in accord with their contracts, and so there is no longer any reason for strikes. The house rent which was in arrears is probably largely paid and furnishes no longer any excuse for disagreement. Thus strike activity is on the decrease, and concurrently the improved condition of the coal business has made it expedient to reopen the mines which were closed, though owing to the long period of idleness no small amount of expense had to be incurred in making them fit for operation.

In the northern field of Ohio there is much discontent with the results of arbitration, and the miners of subdistrict No. 5 want to hold a convention to discuss the wage scale, but little can be done by such a meeting as the contract will remain in force till next spring.

In the Hocking field improved conditions have caused almost all the small plants to resume, but the Sunday Creek Coal Co. continues obdurate. It seems likely that if prices improve even that operation will be disposed to take advantage of the bettered demand, continuing however to protest, with some justice, that only unusual conditions make operation feasible. At present the number of miners drawing strike benefits in the Hocking field is reduced from 6,000 to 2,000. A large number of men have left for other fields, some having gone to the nonunion mines of Kentucky and West Virginia.

⁂

New Sales Plan for the Central Illinois Operators

The principal coal producers of Fulton, Peoria, Tazewell and Mercer Counties in Illinois have formed a sales plan similar to the one followed by the operators of Franklin County, Illinois. The following companies at present compose the organization, while a few others not yet parties to the arrangement will likely join later: Alden Coal Co., Big Creek Collieries Co., Crescent Coal Co., Eagle Mining Co., Logan Coal Co., Monmouth Coal Co., National Coal Mining Co., Star Coal Company of Galesburg, Silver Creek Mining Co. and Simmons Coal Co.

W. J. Spencer has been elected secretary, with headquarters at Brereton, Ill. It is said that these producers have agreed to report to the secretary, for purposes of comparison, the prices at which all shipments are sold and that schedules will be adopted later setting forth the minimum figures at which the different grades or sizes will be sold in the territory served by these mines. The sales territory will be divided into zones and prices fixed for each zone.

COMING MEETINGS

Illinois Mining Institute will hold its annual meeting on Nov. 20, 1915, at Springfield, Ill. Election of officers will be held and the day will end with a banquet.

American Society of Mechanical Engineers will hold its annual meeting Dec. 7-10, 1915, New York City. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

Coal Mining Institute of America will hold its winter meeting Dec. 21-23, 1915, at the Fort Pitt Hotel, Pittsburgh, Penn. Secretary, C. L. Fay, Wilkes-Barre, Penn.

Engineers' Society of Western Pennsylvania holds its monthly meeting third Tuesday of each month; section meeting, first Tuesday. Secretary, Elmer K. Hiles, Oliver Building, Pittsburgh, Penn.

Western Society of Engineers, Chicago, Ill., holds its regular meeting first Wednesday of each month, excepting July and August. Secretary, J. H. Warder, 1785 Monadnock Block, Chicago, Ill.

Kentucky Mining Institute will hold its winter meeting Friday and Saturday, Dec. 3 and 4, 1915, at Lexington, Ky., with headquarters at the Phoenix Hotel. Secretary, Ivan P. Tashof, Lexington, Ky.

United Mine Workers of America will hold its annual convention in St. Louis, Mo., beginning Jan. 17, 1916, and continuing for three weeks. Secretary-treasurer, William Green, 1102-1109 Merchants National Bank Building, Indianapolis, Ind.

Who's Who in Coal Mining

John Lloyd

John Lloyd is not the kind of efficiency engineer the magazines have made familiar in the past few years. He has not made a specialty of motion study or of the arrangement of machines in a shop, though he knows all about the shop and how men should work. He did not take the title and then try to find out what he knew about efficiency, but after he had grown to be an efficiency engineer in reality the position and title were made for him.

He was born in North Wales, not far from Chester, England. His father was a miner there, but came to America early in life and took up work in the anthracite mines, where he was killed by an accident in 1875. There are two other sons—one president of the Coxe Traveling Grate Co. and the other in charge of part of the electrical equipment of the Central Railroad of New Jersey. The mechanical instinct and aptitude are inherited from the mother whose father and grandfather were successful mechanics.

JOHN LLOYD
Efficiency Engineer, Lehigh Valley Coal Co.

John Lloyd had three years of schooling before he went to work at the age of 9. His first job was that of doorboy. Work of this kind is not hard, but the boy has to be there and stay on the job, and in those days the hours were longer than they are now. John Lloyd spent the next 11 years at inside work, running hoisting engines and pumps, putting up brattice and mining coal—in fact, doing almost everything in the line of underground work.

In these 11 years the mines were idle for two periods of nearly six months each, on which occasions young Lloyd went to school. The rest of his education was gained when there was time to spare for it, mostly at night. Sometimes he had the help of tutors and sometimes he worked alone. His first diploma was from the International Correspondence Schools for a course in mechanical engineering. At one time while he was erecting the great sand wheels for the Calumet & Hecla Mining Co., he had as assistant a graduate of Cornell, and the two helped each other. The Cornell man gave Lloyd the advantage of his training, and Lloyd gave in exchange the benefit of his experience. John Lloyd did not have much time for school, but he has made himself a well-trained, well-educated man.

After working in the anthracite mines, Mr. Lloyd went to Mexico and to Colorado and worked as a miner in the bituminous mines, and for a short time he was in the Bessemer Steel Works at Pueblo. Then he went back to Pennsylvania to work for the Dickson Manufacturing Co. at Scranton. This company made locomotives and stationary engines, and Mr. Lloyd had the advantage of special training in the shops. Before long he was made superintendent of erection and had charge of a large number of important contracts. One of these was the sand wheels used by the Calumet & Hecla to elevate slimes. These are 54 ft. in diameter. They were erected in 1890 and are still in use.

He spent seven years with the Dickson company, and then went to the Vulcan Iron Works and later became head machinist for the Temple Iron Co. Next he was chief draftsman for the Jeanesville Iron Works, and after 13 months with this company he became assistant to the mechanical engineer of the Lehigh Valley Coal Co. After three years, in 1906 he was made inspector of equipment. His duties became very extensive, and in February, 1914, the position of efficiency engineer was created to fit the work and the man. In this position Mr. Lloyd looks after the condition and performance of all equipment and makes the necessary tests. He also has charge of the first-aid and rescue work. There is a corps of three assistants who handle such work as Mr. Lloyd cannot attend to personally.

With the aid of one of his brothers he invented the Wyoming automatic eliminator to remove water from steam. For a time he devoted himself to developing this and placing it on the market. It was patented in 1898. It is manufactured in this country by W. H. Nicholson & Co., of Wilkes-Barre, and by other companies in Canada and England. The device has been frequently improved and in every way kept up to date; additional patents have been granted from time to time.

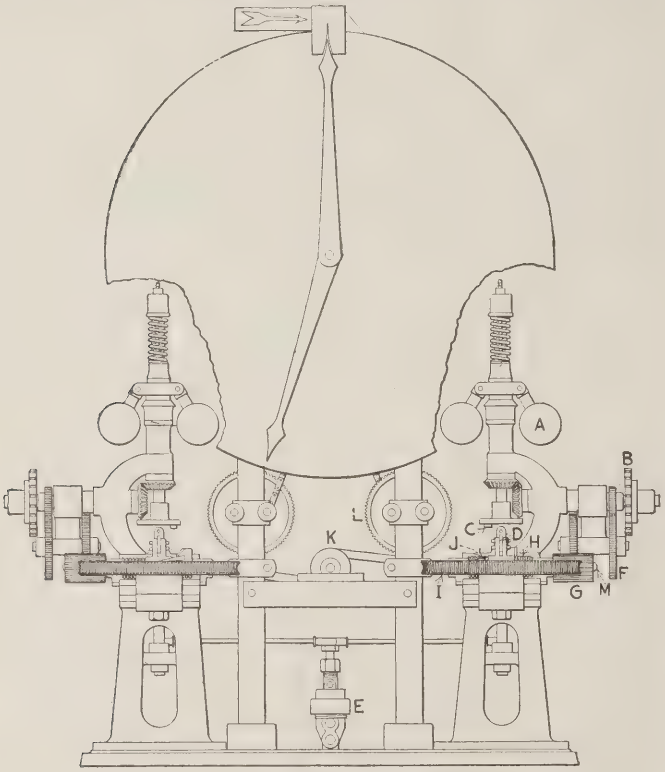
Playing is not much in Mr. Lloyd's line, because he never had much time to learn how, but he admits that he likes to drive his auto. Occasionally he fishes a little, but as far as is known he does not tell stories about it. He is a member of the American Institute of Mining Engineers and of the Engineers' Society of Northeastern Pennsylvania. All of which is a pretty good record for a boy who went to work at 9 years of age.

New Apparatus and Equipment

New Safety Governor

An improved type of overwinding and overspeeding apparatus for use in connection with hoisting engines serving either shafts or slopes has recently been developed and placed on the market by Royer & Zweibel, of Wilkes-Barre, Penn. It is known as the Roybel emergency governor.

The construction and operation of this machine are extremely simple. Referring to the accompanying drawing, the flyballs *A* are driven by the sprocket *B,* which in turn is driven direct by chain from the drum of the engine. The stem of the governor, which carries two separate springs, terminates at its lower end in a disk carrying the pin *C.* As the speed of the engine increases and the balls fly out, the stem descends, and at a predetermined maximum allowable speed the pin *C* clears the lever *D* by a small amount. The flyballs are now opposing only one of the stem springs. If the speed is increased, exceeding the predetermined amount, the flyballs compress both springs, and the pin *C* strikes and throws the lever *D.* This immediately applies steam to the brakes through the three-way valve *E.*

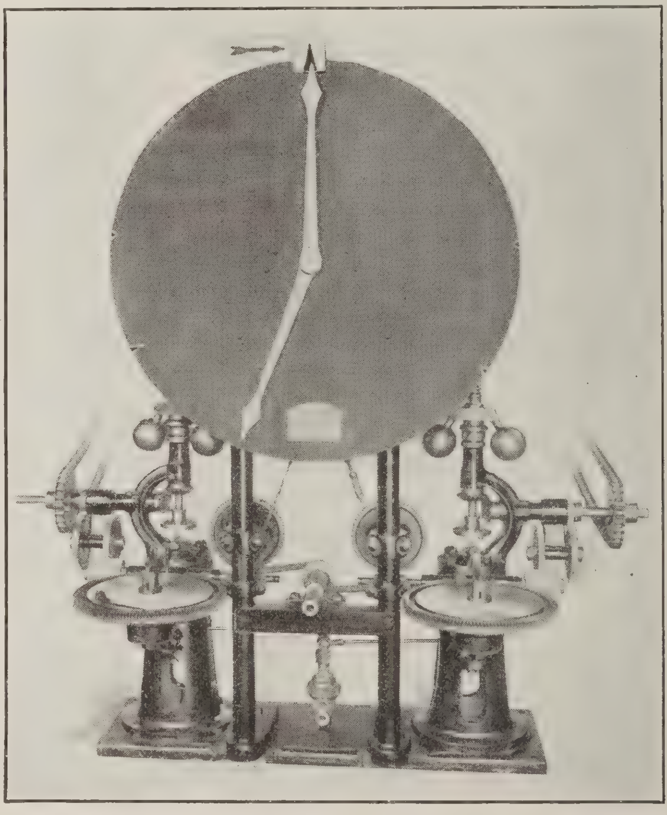


DETAIL OF ROYBEL EMERGENCY GOVERNOR

Motion from the sprocket wheel *B* is transmitted through the intermediate shaft and gears *F* and the long pinion *G* to the worm *H,* which drives the wormwheel *I.* Near the rim of this wheel, at a point adjustable to suit the conditions, is placed a double or graduated incline *J.* The arrangement is such that, when the landing is approached, this incline lifts the lever *B* into close proximity to the pin *C,* and unless the speed is properly reduced and the pin *C* allowed to rise with the disk and governor stem, the lever *B* will be thrown and the engine brought to a standstill.

When the hoist is complete and the cage stands in the dumping position, the steep portion of the incline *J* is touching the lever *D,* and any further movement of the cage in an upward direction will apply the brakes. Overwinding, overspeeding and moving the cage in the wrong direction are thus impossible.

The machine is equipped with a dial provided with double pointers—one connected with and controlled from the tight drum and one from the loose drum. The relative position of the pointers then indicates the level being served. As the cage leaves the dumping point the red semaphore at the top of the dial swings down, while when the other cage approaches the dump, a semaphore on the other side appears. This gives a visual indication to the engineer of which cage is to be lowered. This dial thus indicates at all times the exact position of each cage and which landing it is serving.



FRONT VIEW OF THE GOVERNOR; NOTE LANDING MARKINGS ON DIAL

When the signal to hoist men is given, the engineer gives a return signal by throwing a lever. This not only gives the bottom cager a visual signal (usually an electric light), but by revolving the crank disk *K* moves endwise the worm shaft carrying the worm *H* and pinion *G,* thus revolving the wormwheel *I* until the incline J takes a position corresponding to the ground landing. It now becomes impossible for the cage to approach the ground landing at too great a speed or to pass it. A second worm on the same shaft as the worm *H* operates the wormwheel *L*, which through a sprocket chain actuates the pointers on the dial.

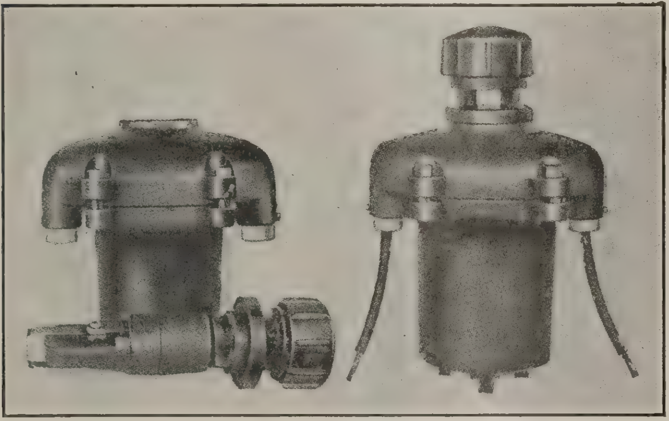
As may be seen from the accompanying illustrations, this machine is extremely simple in design, while its operation is positive. Machines of this type have been in use for some time at various mines in the anthracite region and thus far have given satisfaction.

⁂

An Oil-Immersed Fuse

An oil-immersed fuse cutout for high-tension work has been placed upon the market by the D. & W. Fuse Co., of Providence, R. I. The unreliability of inclosed fuses on high-tension work is generally known, and a study of the problem involved induced the company to place this oil-break fuse before the public.

There is nothing new in the idea of a fusible wire placed in oil and used as an electric protective device. In the past, however, the design of this piece of apparatus has been crude and its operation as a general thing unsatisfactory. The new type of cutout has eliminated many of the defects in the older forms of this apparatus and has proven satisfactory under severe conditions and over considerable periods of time.



FUSE WITH CARRIER REMOVED FOR FUSE RENEWAL; ALSO APPARATUS ASSEMBLED

In the new apparatus the fuse and its carrier are immersed in a special oil that prevents the formation of an arc. The body of the device is provided with an effective venting system that prevents any accumulation of pressure within the casing and the loss of any appreciable quantity of oil through blowing out.

The oil container has at its bottom a plug that permits the drawing off of the oil when this becomes necessary. Under ordinary conditions of service, however, this would not require drawing off and replenishment more than once in one or two years.

These cutouts are equipped with flexible cable terminals, to which the line terminals may be soldered. This eliminates the necessity of making complicated connections within the device itself.

At present three capacities of cutouts are on the market, all designed for overhead line construction and being in capacities of 50, 100 and 200 amperes at 2,500-volt pressure. The fuse pieces proper are made from a carefully prepared special alloy of low melting point and high conductivity.

A commercially practicable protected device of this nature is limited as to dimensions and consequent overload capacity. Special precautions have been taken to design the apparatus so as to render re-fusing safe for the operator. A new fuse may be inserted even when the line is short-circuited without risk to the repair man, as the whole device is especially locked against the ejection of the carrier and the oil in case of the unexpected blowing of the fuse during the operation of re-fusing.

This is effected through automatically locking the cover before contact is made with the fuse terminal. The cutout is not intended as a switching device. It may nevertheless be depended upon to open moderate loads when used in this manner.

Recent Legal Decisions

Proving Relationship of Employer in Injury Suits—When defendant in a suit for injury to a miner denies the relationship of employer to the injured man, any evidence, however slight, tending to show who was operating the mines on the day of the accident is properly admitted. (Alabama Supreme Court, Amerson vs. Corona Coal and Iron Co., 69 Southern Reporter, 601.)

Contributory Negligence of Driver—There can be no recovery for death of or injury to the driver of a coal wagon who drove his team at a rapid pace along a street while one wheel of the wagon was in the gutter, although the city may have carelessly permitted the obstruction to exist in the gutter, which, being concealed by snow, caused the accident. (Pennsylvania Supreme Court, Short vs. City of Carbondale, 95 Atlantic Reporter, 254.)

Authority of Corporate Officers—A company engaged in buying and selling coal is entitled to repudiate a purchase of bank stock made by its manager with funds of the corporation, without express authority. Persons dealing with the manager of a business corporation have no right to assume that he has any authority to enter into a transaction beyond the scope of the concern's regular business. (South Dakota Supreme Court, Porter vs. Lien, 153 Northwestern Reporter, 905.)

Discrimination by Railway Company in Furnishing Cars—The fact that coal is sold by a mine owner f.o.b. the mines does not prevent him from securing redress before the Interstate Commerce Commission for unjust discrimination in furnishing cars for shipment of the coal if the shipments are of interstate character. But after he has obtained a ruling from the commission to the effect that the carrier has been guilty of unjust discrimination, it is too late to maintain suit in a state court to recover damages under a state statute on account of the same transaction. (United States Supreme Court, Clark Bros. Coal Mining Co. vs. Pennsylvania R.R. Co., 35 Supreme Court Reporter, 896.)

Effect of West Virginia Mining Laws—The West Virginia Mine Foreman Law does not relieve an operator of the duty of maintaining motors and motor tracks in reasonably safe condition, that duty not being devolved upon the foreman. An operator's failure to adopt or post a rule regulating the number of cars that may be hauled by a motor renders him liable for injury to a miner directly attributable to such failure. A report of a district mine inspector respecting the condition of a mine as to safety is not legal evidence in a suit for injury to a miner, although of course the inspector may testify to conditions found by him. (West Virginia Supreme Court of Appeals, Jaggie vs. Davis Colliery Co., 84 Southeastern Reporter 941.) An operator is liable for injury to a minor employee resulting from failure to warn him against dangers of which he cannot reasonably be expected to know. Such an employee may rely upon his superintendent giving him instructions concerning dangers naturally attending work to which he is assigned, unless by reason of his capacity and experience and knowledge of the hazards of the work he fully appreciates the dangers and proper means of avoiding injury therefrom. (Dillon vs. United States Coal & Coke Co., 84 Southeastern Reporter, 956.)

Editorials

Mr. Dean's Remarks Upon the Output of British Mines

Americans have for a long time wondered at the low output of European mines. When a visitor comes from across the water and the matter is discussed, he usually is quite unable to explain why the countries outside Europe secure larger tonnages per man than do the mines in the confines of that continent.

In a recent paper read before the North of England Institute of Mining Engineers, Samuel Dean, an Englishman, now with the Colorado Fuel and Iron Co., who has traveled extensively in Great Britain, France and Germany and has visited the mines there, states that he has found the answer in the small equipment, especially the small mine cars, in use in those countries.

His advice to the British is the same as that of Michelangelo to Raphael—"amplius"; that is, larger. After being thus admonished Raphael produced those wonderful cartoons that made him famous, and the advice of the artist is scarcely less applicable to the needs of all Europeans who are engaged in trade. They with their interest in embellishment have built beautiful plants; with their instinct for minutiae have developed the preparation of coal for the market to a wonderful degree of perfection. But in the larger matters they seem to fall behind. There is always something hinders them from a large concept of business.

The railroad cars in Great Britain, for instance, have a capacity of only about 10 tons, because the heavier material goes by sea and not by land, because the turntables and bridges would have to be rebuilt if the equipment were made larger, because the local shipper wants a small car and will not willingly combine with his neighbor to take a part of a "goods waggon," and also because the horse-switching would have to be abandoned at the local stations if the cars are made larger. All of which are excuses, not reasons, if the railroads would only see it.

In the mines, the "tubs" must be small; for is not the coal low? do not women in many cases have to dump them? is not the equipment already standardized? are not the ponies too light to haul heavier loads? and so on *ad infinitum*. These also are not reasons as we see them.

The foreigners who visit here are shown our finest mines with the thickest coal. If they were taken to the workings where coal under 3 ft. thick is mined, they would find the roof taken down or bottom lifted and room made for a fair-sized car of great width and suitable gage. They would see that low headings do not involve rats of mules or ponies, but electric haulage.

There are other causes than pigmy equipment for low production in Europe. One is the attitude of the unions, based not so much on pure resistance to authority as on a false political economy. They do not believe a man is paid in what he produces. They believe the company pays what it will and that small production will not involve low pay if union activity is only sufficiently intense. Americans know differently and realize that the baker must bake bread if he would feed many children and the miner must mine much coal if he would have any large measure of prosperity. His brain has not yet been addled by a century of false reasoning.

Moreover, the mines of Great Britain are often extremely warm and enervating, and this fact tends to reduce the tonnage. This can be met partly by a more generous coursing of air, which is in many mines not even equal to that common in the best American practice. The relations between capital and labor can be solved by a sympathetic discussion of the question of wages and profits, and the matter of small units can be corrected by ordering new and larger equipment and giving more attention to the larger problems of production than to the grading of product and the building of mammoth power houses. These latter details are important, but they take second place compared with volume of output whereby marked economies can be secured.

The Colorado Settlement

The settlement between the miners and the Colorado Fuel and Iron Co. is a great triumph for everybody. Peace, harmony, the reëstablishment of industry are blessings not to be regarded lightly, but it is absurd for the organizers of the strike to claim it in any sense as a victory of their arms. The true success has been the renewal of the order they destroyed and the peace which they violated.

At best the company has made a contract with its men to deal with them under that instrument as it dealt with them before without it. Wages have not been raised; the hours, which were already 8 hr. per day, have not been shortened; checkweighmen, not denied before the strike, are permitted by contract now.

The four achievements were the bringing of Rockefeller to Colorado, the formation of the arbitration committees, the provision which practically secures that men shall not be discharged for incompetency or any other reason than the violation of a recognized offense and the promise to raise wages synchronously with competing fields. For none of these things was the strike started. Unless the recognition of the arbitration committee is considered as tantamount to an acceptance of the union, which that organization vigorously denies, there is nothing in the instrument covering those demands of the union to which the company had refused to concede.

The best policy of the union will be to leave the coal mines of Colorado severely alone for the present. If the existing arrangement is loyally followed by the Colorado Fuel and Iron Co., and other operating concerns imitate it, the men will have all the union promises, and Colorado competition will not make other states reduce their mining price. If the agreement is not followed, then the union will have some reason to try to invade Colorado again.

But so long as the men in Colorado are getting their just dues the union may well keep away, remembering that the purpose of the union is not, or should not be, to promote strikes and can never rightly be to seek its own aggrandizement. Its excuse for being can only be found in its promoting the interests of the workingman when those interests are assailed. Like many other organizations, the union is apt to be started for a well-defined purpose, and ultimately its work is extended, not so much for that purpose as for the good of the order.

Meanwhile the operators of Colorado will do well to watch their conduct and not give the union an excuse for anything but a merely perfunctory activity. And the union men allowed to remain within the camps may prove by their conduct that the union button is not a badge of disorderliness, but a mark of honor. There is too much talk of the "eternal conflict," as if war between capital and labor were an end in itself, instead of an abnormal condition only existing when one or the other is at fault.

⁂

West Virginia's Trade Prospects

Any paper one may pick up from West Virginia assures us that the state is about to go into bankruptcy as the result of an increase in freight rates that will make it impossible to operate the coal mines. Such a volume of untruth has been unloosed about this matter that it really becomes any paper having a duty to the coal industry and to the public to print the truth of the situation without fear or favor.

Really *Coal Age* cannot believe that the change is going to do any more than prevent a certain undesirable condition from continuing any longer. For a long time the operators of Ohio and Pennsylvania have been transferring their capital from those states to West Virginia. Year by year they have closed down their plants in manufacturing states, where coal and the means of its utilization are located side by side, to open up in a state where a lower wage scale prevailed and a lower ton-mile freight made access to outside markets easy.

These conditions have built up West Virginia. No one wishes to see that state idle; no one desires to see its plants abandoned. But conversely no one would desire that the people in the neighboring states be unemployed and their mining improvements rotting to the ground.

The action of the railroads passing through West Virginia being more generous to that state than to other states adjoining has had this latter effect. Bankruptcy and dormancy are normal conditions for plants in both the Buckeye State and the Keystone State.

Some of the operators in West Virginia who are strongest in defending those conditions in the state that have injured other commonwealths have idle holdings in Pennsylvania and Ohio, and they know that these are facts that have just been stated, and their former employees also know it, for until the recent generous accession of business these miners were idle nearly all the time.

But it cannot well be expected that West Virginians would willingly see the locust pass over that state as it has passed over Ohio, if it could be possibly avoided, no matter what may have happened in the past. People must be willing to see justice done *now* and pass a ready statute of limitations to cover the past. No group of industrial workers must suddenly be deprived of work; no tipples, shafts or villages must be allowed to decay by a too-sudden righting of unnatural conditions.

But if Col. J. W. Dawson it to be believed, that is just what is going to happen in West Virginia. In his address before the State Board of Trade at Fairmont he asked, "What would happen to the banks if $75,000,000 annually, or $250,000 daily, should be hereafter cut off?" The question is insincere, for no one believes, and certainly not Colonel Dawson, that the whole coal trade of West Virginia, east and west, is going to be utterly destroyed by an increased freight rate of 15c., or barely 10 per cent., which moreover affects only the western trade.

The new freight rate will not affect the New England business. It will not modify the condition of the bunkering market at Tidewater. It will not affect any of that European trade which West Virginia so cheerfully anticipates. In most places the only effect will be to increase the cost of coal to the consumer 15c.

In some places perhaps Ohio coal, securing by the new freight rate a larger price of 15c., or even a part of it, will be able to do business and compete with West Virginia coal, but for the most part the West Virginia people will add the freight to the cost of coal, and they should be grateful that they are allowed to do that. If they came to New York City like the anthracite operators, they would be apt to be told by the newspapers that increases of wages, of freight rates and of taxes and the imposition of new working conditions should not cause them to change the cost of coal one iota.

Col. J. W. Dawson alleges conspiracy, but the operators of the states which neighbor West Virginia, while not so ready to quarrel among themselves, are by no means so anxious to combine. There has been little enough unity among these operators, who have a common need. But when they went to convention and met the miners they told the latter that if the union compelled them to grant an increase the union must compel the West Virginia operators to be as generous. And the union promised to do so.

Such a demand is only right and just and no crime. The whole convention between miners and union is a like conspiracy; for do they not one and all declare that the changes in the agreement in one part of the unionized field shall be like those in every other?

It is stated by a press agency, which is spreading Mr. Dawson's remarks for the enlightenment of the public, that "Mr. Dawson also showed that if West Virginia could market her coal on as favorable conditions as Pennsylvania, the values of coal lands would grow from $100 to $200 per acre, their present values, to $1,500 to $2,000 per acre, the value that obtains in Pennsylvania."

Now there is no reason why a state remote from the market should be granted such rates as will put her on a perfect parity with another state having a market at the point of mining. The operator does not have a right to charge the same price for coal delivered to the merchant in Morgantown as he does to the dealer in New York. But overlooking that matter, the statement that coal land sells in Pennsylvania for $2,000 per acre is probably only true of part of one county. Little of it sells at any such figure. Much of it is selling for from $25 to $150 per acre.

Nor is it true that all the coal in West Virginia sells from $100 to $200 per acre. Some of it is held at even lower prices while some is not on the market at all. Some few years back a large area in the Pocahontas field could be leased only on paying a lump sum of $25 per acre for a lease, which conferred merely the right to mine coal for 15c. per ton. This coal had to be extracted according to a prescribed method, and as the seam was 10 ft. thick it could not fail to produce 15,000 tons to the acre. Thus the ultimate return per acre would be $2,275. So, after all, owing to the gracious consideration of the railroads by which the state has been developed, the conditions in West Virginia, despite its youth and geographical isolation, have not been unfavorable.

The average operator in West Virginia is like those in every other part of the Union. His notions of right and wrong are broadly based on justice and common-sense. He smiles and must continue to smile at the hotheads who misrepresent him. And indeed perhaps they smile altogether too much at men who do the State of West Virginia little credit by their unfair representation of its case.

The reputation of the state is worth something. When the word of the operators is once disregarded as a negligible thing, they will not be heard later, cry they never so lustily in their own defense. It is time that the sober-minded operators take a strong hold on the wheel and direct the campaign of the operators of the state along the lines of reason and self-respect.

⁂

Mr. Foster Comments Upon the Consolidation and Expresses Appreciation to Friends

Practically every coal-mining man familiar at all with the fuel industries at large is acquainted, either personally or otherwise, with Rufus J. Foster, who has managed *The Colliery Engineer* for so many years. It is fortunate that the new and enlarged paper will have the good-will and frequent advice of Mr. Foster. It would be difficult to imagine the perpetuation of *The Colliery Engineer* without his name and personality closely linked with its conduct, no matter in what form that might be. Mr. Foster says:

RUFUS J. FOSTER

"The consolidation of *The Colliery Engineer* with *Coal Age* means the production of *one* superlatively good coal-mining periodical in place of two.

"It means that the former subscribers to both *The Colliery Engineer* and *Coal Age* will receive in one periodical all of the best features of the two papers. Thus there will be no duplications of articles on technical mining subjects or of other coal-mining information.

"It means to advertisers one medium filling the field formerly occupied by two, and that one medium reaching the entire field in the most desirable manner.

"While the consolidation means so much for both the subscribers and advertisers in *The Colliery Engineer* and *Coal Age,* I cannot help a feeling of sadness and sincere regret that the many years of pleasant relations that have existed between me and the friends of *The Colliery Engineer* are, to a certain extent, officially terminated; the only compensation being that I know the consolidation means a benefit to the patrons of both papers and that it allows me more time to devote to important duties as an executive officer of the International Textbook Co. and the International Correspondence Schools.

"While I shall not be officially connected with the new and enlarged journal, I will be in a measure connected with it in an advisory capacity and as a contributor, and I sincerely request that my many friends in the coal-mining industry will continue to give to Mr. Parsons, his assistant editors and the advertising representatives the same consideration that has always been extended to me and my assistants." RUFUS J. FOSTER.

⁂

Mr. Young Continues His Editorial Connection

The new weekly that results from the combination of *The Colliery Engineer* with *Coal Age* will be represented by C. M. Young in the anthracite field. Mr. Young has been persuaded to continue his editorial work as an associate editor of the enlarged journal; thereby bringing to the consolidated paper all the experience, plans and incompleted effort that he has initiated in behalf of *The Colliery Engineer* in recent months. Mr. Young will concentrate his attention principally upon the hard-coal fields, which plan will afford the new paper better service than has ever been possible with either of the old papers singly. Mr. Young's good work on *The Colliery Engineer* made for him many strong friends throughout the country, and especially in the anthracite field. His ready understanding of editorial duties and his broad conception of this class of educational work leave no doubt that readers of the consolidated journals will profit by his editorial efforts. He says:

C. M. YOUNG

"The consolidation of *The Colliery Engineer* with *Coal Age* makes possible the publication of a coal-mining periodical which can satisfy the needs of everyone connected with the production and marketing of coal and coke.

"*The Colliery Engineer* was preëminently a technical magazine. Founded in the anthracite district of America, its interests had extended to all parts of the world. Now that it has been joined to *Coal Age,* its new publishers are entitled to the friendships that it had won, and the opportunities of the combined papers for service are greater than those of either alone and greater than the sum of these.

"I am personally glad to retain connection with the combined papers as the representative in the anthracite field. I hope that the friends of *The Colliery Engineer* will realize that the new publishers desire to retain their good will, that all that was good in either paper will be continued in the new form and that the new paper will serve them better than either of the old papers alone could do." C. M. YOUNG.

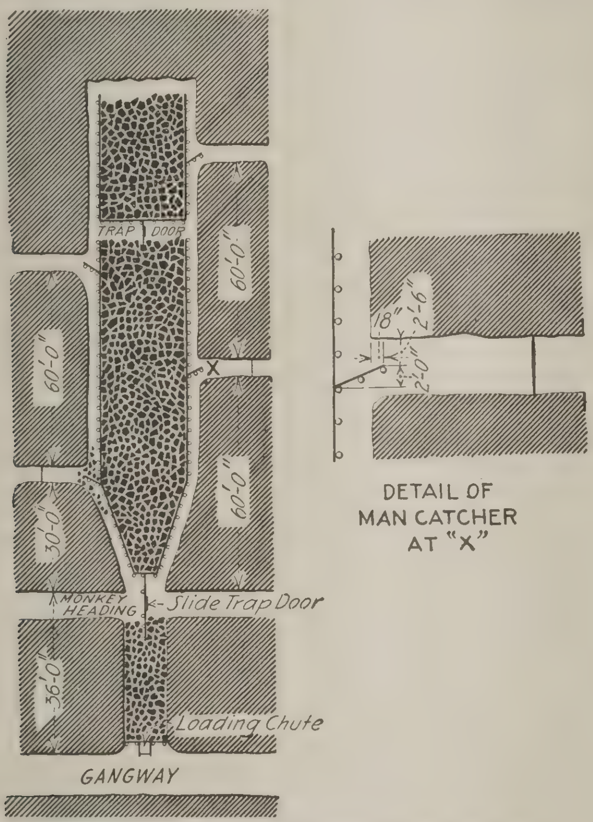
Susquehanna's Safety Methods

By R. Dawson Hall

SYNOPSIS—The Susquehanna Coal Co. has, with gratifying results, carefully investigated all the conditions at its collieries with the intention of reducing accidents. Some of its methods are here detailed. Especially interesting is the "man catcher" for steep pitches.

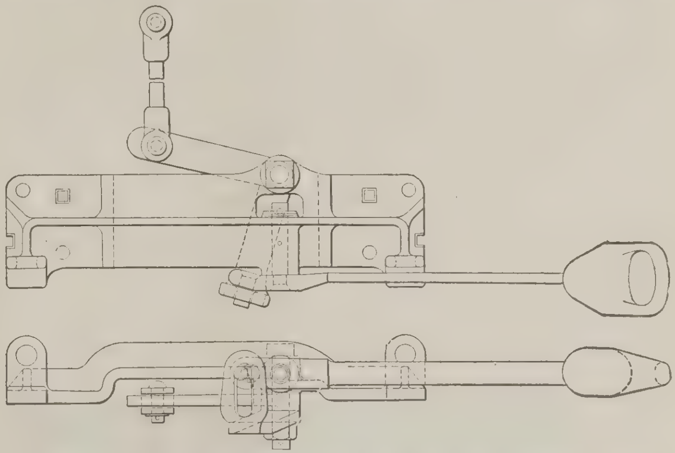
The Susquehanna Coal Co. has carefully utilized all its native talent to ascertain unsafe conditions in its mines, but it has not been content with this. It is well known that the coal company was formerly affiliated with the Pennsylvania R.R. Owing to this earlier connection it has been enabled to draw on the resources of the parent company, and in that way has been able to learn much that does not readily enter a mining company's experience.



MANCATCHER AND SAFETY BATTERIES

A company mining coal is duly impressed with its accidents from haulage and roof falls, but its men so rarely have eyes put out by flying steel or their clothes caught in gears or setscrews that matters of that kind get less consideration than they deserve. Still such accidents are liable to occur where there is unprotected machinery; and any superintendent from a large railroad shop would be sure to note such conditions, whereas a mine superintendent would be apt to be utterly indifferent. He could see the danger, but he would not have had the experience that would force the importance of the matter upon him. So the Susquehanna, desiring to find all the dangers possible and to learn as little as necessary from so expensive a teacher as experience, has sought to get all the light it could from people who are experienced in kindred lines and who have paid for their knowledge often in terms of human lives.

There is always a disposition to get mining men to criticize mining methods, whereas in the matter of machinery at least the outsider is often better qualified to throw an entirely new light on the problem of safety, both by his larger experience in the type of accidents to be avoided and by his acquaintance with other books and people. This new angle of view, or even an element of remoteness and lack of acquaintance with the dangers to be avoided, has its value. A man who has experienced any particular line of dangers repeatedly does not react as readily to them as one who sees them for the first time.



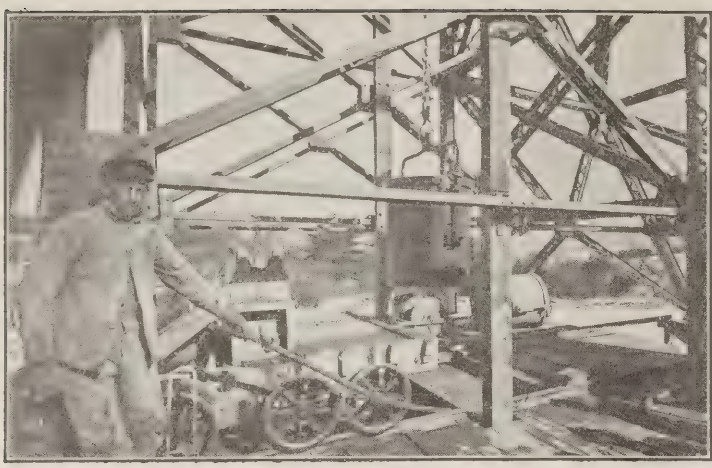
A SWITCH WHICH THROWS PARALLEL WITH THE TRACK INSTEAD OF AT RIGHT ANGLES

The investigation by all classes of experts has not been without actual results. The fatality rate has fallen from 32 in the first eight months of 1914 to 17 in the same period in 1915, or nearly 47 per cent.

Device to Protect Men Falling in Manways

Among the new safety developments is one at Williamstown colliery in the Lykens division of the Susquehanna Coal Co. This is illustrated in this article. It is designed to reduce the seriousness of a fall down a steep manway and is called the "mancatcher." Another feature illustrated in the same plan is the "safety battery," which is placed every 100 ft. Mancatchers are built in at every crossheading, so that if a man falls he does not hurtle the full length of the battery, but only to the nearest mancatcher, which is located at the adjacent crossheading and is in no case over 60 ft. below him.

These mancatchers also protect the miner or laborer when he is traveling up the manway from anything which



SINKING BUCKET TRUCK AND SAFETY GATE AT NANTICOKE NO. 8

The safety cover is pulled over the shaft by the rope in the hand of the head tender

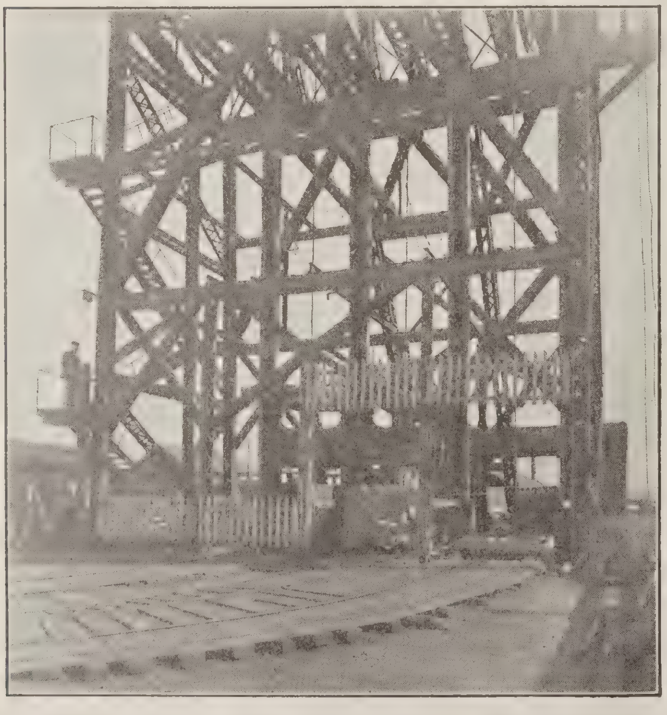
The third wheel on each side spans the gap in the rails left for the shaft guides

may start to fall down on him. The mancatcher extends from the filled battery out 18 in. into the crossheading. This passageway is only 5 ft. wide, but the miner is readily able to pass around the mancatcher in climbing into his place. The device is simply constructed of three props which are planked from top to bottom.

The safety battery is placed every 100 ft. and is so contrived that if anything goes wrong a man can take a shortcut through the sliding trapdoor instead of traveling up to the face of every room in order to reach a place of safety. It is the end of the room which is most likely to be dangerous. Where there is the support of the broken coal, as in the center of the room, the danger is not so imminent as at the working face; so the trapdoor at every 100 ft. gives a real assurance of safety to every workman.

The company expects to reduce track accidents by using the switch stand illustrated herewith. In throwing the switch, as will be noted, the switchtender throws the lever in a direction parallel to the track instead of at right angles to it. Consequently, if he pitches forward in doing so, he does not fall over the rails, but alongside the track. He consequently does not run nearly so great a risk of falling into the cars and being killed.



SAFETY GATES AT HEAD OF SHAFT AT NANTICOKE COLLIERY NO. 7

They prevent the miners from entering cage from both sides of shaft

Care to Avoid Accidents in Shaft Sinking

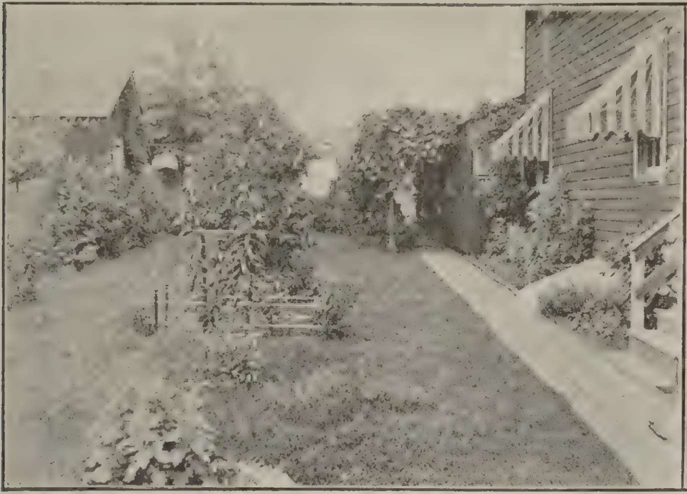
Shaft sinking has an unenviable reputation as a source of danger when the small number of men engaged in that work is considered. The fatality rate is high in percentage even though the actual loss of life from that source is not great. As a shaft in process of sinking is not a mine the records hardly reflect the fatality rate as they should.

The definitions of the law in many states relieve new shafts from the official visits of mine inspectors. New projects often do not employ the required number of men, they are not producing coal and therefore are not mines, and they are so remote that frequent visits to them would occasion much loss of time and the expenditure of much trouble. Hence, records of shaft-sinking accidents are probably not complete.

The Susquehanna Coal Co. has adopted many means for preventing these accidents at the new shaft No. 8 being sunk near Nanticoke at Nanticoke No. 7. There is always risk of a piece of rock or a tool falling on the men working at the bottom of the shaft. To prevent this a safety cover is pulled over the shaft opening by a rope, which in the illustration is being held by the head tender.

This cover is put in place after the bucket is lifted and before the safety truck is pushed into place. In addition there is another pair of safety covers under the one shown. The shaft is being sunk without the use of any naked lights, electricity being used exclusively for lighting. The reel by which the lights are raised and lowered can be seen under the hanging bucket. There are contacts on the side of the reel which provide a continuous lighting current in the system regardless of the length of wire that has been unwound.

The dumping truck for the shaft-sinking bucket is shown in another illustration. The bucket is hoisted high enough to allow the truck to be pushed under it. As soon as the shaft doors are closed the bucket is low-



YARD OF A SHAFT ENGINEER AT SCOTT COLLIERY WHICH TOOK FIRST PLACE

The award was made not only for the flowers and lawn shown but for the vegetable garden in the rear. John Moore, the tenant, is an employee of the Susquehanna Coal Co.

POSEY GARDEN OF FRANCIS SCHUCK, A MINER AT PENNSYLVANIA COLLIERY

Rear part of garden devoted to vegetables and poultry coops and kept in neat and sanitary condition. Second place was awarded.

ered, unhooked and pushed on the truck to the edge of the platform, where it can be dumped. The truck has three wheels on each side so that it can span the gap in the rails necessarily left for the shaft guides and the passage of the billy. The wheels are so disposed that the truck always rests on four wheels and is not tilted even when it is passing over the gap in the rails.

Safety Gates and Their Shrouded Counterweights

Another illustration shows the head of the shaft at No. 7 colliery, Nanticoke; and the reader has his attention called particularly to the safety gates which are placed so as to prevent men from getting on the cage from both sides of the shaft. They are thus obliged on entering the cage to pass by the head tender. The foreman on the left is pointing to the gaspipe guard surrounding the counterbalance weights which prevents the latter from injuring anyone should the counterweights break loose.

Excellent living conditions go hand in hand with safety. If a company's towns are undesirable places, the best men do not come to work in its mines and those that are there leave. The better element of citizenship is not present in a rough-and-tumble village to control the less amenable members of the community. For after all, the restraint of the good workingman on his fellow is worth all the company discipline which can be imagined.

GARDEN OF FELIX WITCOPSKI, A MINER AT LYTLE COLLIERY

This garden took third place, not because of its beauty but because of its great productivity

Probably reasoning partly in this manner the Susquehanna Coal Co. has encouraged gardens, and the towns no longer look like their former selves. The work is not done for money prizes, but competitions are held, and gardens are rated not alone for beauty but also for productivity. Some of the lost time of our colliery villages is redressed by the work done in the gardens, and many a wanton action is prevented because the gardening work consumes energies which have to find a vent somewhere.

Accident Prevention and First Aid*

By H. S. Salmon†

SYNOPSIS—The author questions which is the more important, safety first or first aid, and whether the emphasis on the first of these should be laid on the education of the workman or on the provision of safeguards. He designates first aid as "picking them up as fast as they fall" instead of saving them from falling.

The ancients regarded lightning as a demonstration of the wrath of the gods whom they worshipped. They sought no further explanation, but piously put out the fire and repaired the damage done by the thunderbolt or, in the case of the early Romans, walled the place about and consecrated it to the god of lightning.

It has taken many centuries to turn the eyes of man from the effects of lightning to its cause, to prove its identity with electricity and to use that knowledge for the good of humanity. In other words, as regards damage from lightning, it has taken a long time to see that the lightning-rod and the fire department are the ounce of prevention and the pound of cure.

And in other similar matters the same misjudgment has been made. The results of accidents have made such a strong impression that they have overshadowed the causes. We are apt today to see similar events occur time after time before we associate them with a common cause. Safety organizations and individuals interested in safety must carefully guard against this error. In the conservation of men the study of the causation of accidents must certainly precede every other phase if we are to have any success in reducing fatality and accident rates.

---

*Article read before the Alabama Safety Association, Birmingham, Ala., entitled "Accident Prevention and First Aid—Their Relative Importance."

†Safety inspector of ore mines, Tennessee Coal, Iron and Railroad Co.

Our problem is not short-lived, but is of as long duration as the occupations which we follow, and will constantly become more complicated with the development of machinery and with changes in methods. The advent of labor-saving machinery was met with violence and disapproval for fear it would displace the workman, but today he is as necessary as he ever was. It is vitally important, therefore, that we determine the proper lines of endeavor and classify them in the order of their importance.

How seldom when an accident happens do we give the result our entire consideration. Our attention is turned to the man who is hurt, and later perhaps to his needs or those of his family. We lose sight of the cause of the accident or, like the Romans, wall the particular spot about with a safeguard and consecrate it to the god of bad luck. Yet there still remains unsolved the problem of protection for the thousands of other men who must work in that mill or ride that train or go into that mine.

Safeguards in Mill; Education in Mine

To each of us safety first has a different meaning. We look at it in the light of the problems we are called upon to solve, but all safety problems have a great many elements in common. The principal factor of solution in the mine where conditions are constantly changing may be education; in the factory, where machinery and men have fixed positions, safeguards; yet education and safeguards are important in both places. What the other fellow has to contend with and how he does it is going to have a bearing on the general problem and will interest and broaden all of us.

The best way to determine which subject is the more important for study is to determine that which renders to the individual workman the more valuable service. Take the case of John Smith, a workman of average intelligence and with a number of years' experience. He does his work as he learned to do it. He has had first-aid instruction. In the course of his duties he passes by a piece of board with some nails protruding from it. He is in a hurry, and if he thinks of it at all probably says that he will not have to pass that way again. In this he is only human. How many automobilists, having safely passed such a board on the road, would return and throw it aside? Another workman follows Smith who is naturally less alert or perhaps has kept late hours the night before. He steps on the nails and is injured. Smith hurries him to the hospital, and in consequence the man is laid up for only a few weeks.

Later the management introduces a safety campaign, and Smith gradually becomes accustomed not only to noticing but to looking for and removing dangerous conditions. The other workman could follow him now without accident and has himself absorbed enough of the spirit of the movement to avoid dangers unconsciously. The result is that Smith is put to much less trouble in removing or reporting dangerous conditions than he was in taking his fellow-workman to the hospital. The fellow-workman not only does not have to suffer pain, but will in time be one of the army of Smiths who make things safer for the men who follow him.

Every accident is either the result of unusual conditions or the result of some irregularity such as carelessness, fatigue or stupidity within the man himself. The terrible mine explosion which now and again strikes the industrial world like a thunderbolt can often be traced to a careless or stupid miner coming in touch with abnormal gas conditions. When a man, careless, indifferent or untrained in safety, comes in contact with an unusual situation an accident is almost bound to happen. A plan of thorough safety education is the only lightning conductor which will make that contact without danger and without damage.

This paper does not attempt to answer the question as to the relative importance of first aid and safety first. It is merely intended to invite discussion of it. But if we are to have an ideal which we are going to strive to attain it must certainly be based on the principle that thorough and perfect preventive measures will eliminate the necessity of first aid.

The following poem from the "Travelers Standard" tells this same story so well that it is here given in full:

THE PARABLE OF THE DANGEROUS CLIFF

'Twas a dangerous cliff, as they freely confessed,
Though to walk near its crest was so pleasant,
But over its terrible edge there had slipped
A duke and full many a peasant.
The people said something would have to be done,
But their projects did not at all tally.
Some said, "Put a fence round the edge of the cliff";
Some, "An ambulance down in the valley."

The lament of the crowd was profound and was loud,
As their hearts overflowed with their pity;
But the cry for the ambulance carried the day
As it spread through the neighboring city.
A collection was made to accumulate aid,
And dwellers in street and in alley
Gave dollars or cents, not to furnish a fence,
But an ambulance down in the valley.

"For the cliff is all right if you're careful," they said,
"And if folks ever slip and are dropping,
It isn't the slipping that hurts them so much
As the shock down below—when they're stopping."
So for years, we have heard, as these mishaps occurred
Quick forth would the rescuers sally
To pick up the victims who fell from the cliff,
With the ambulance down in the valley.

Said one, in his plea, "It's a marvel to me
That you'd give so much greater attention
To repairing results than to curing the cause;
You had much better aim at prevention.
For the mischief of course should be stopped at its source
Come, neighbors and friends, let us rally;
It is far better sense to rely on a fence
Than an ambulance down in the valley."

"He is wrong in the head," the majority said;
"He would end all our earnest endeavor.
He's a man who would shirk this responsible work,
But we will support it forever.
Aren't we picking up all just as fast as they fall
And giving them care liberally?
A superfluous fence is of no consequence
If the ambulance works in the valley."

The story looks queer as we've given it here,
But things oft occur that are stranger.
More humane, we assert, than to succor the hurt
Is the plan of removing the danger.
The sensible plan is to safeguard the man
And attend to the thing rationally;
We should build up the fence and thus try to dispense
With the ambulance down in the valley.

Discussion by Readers

Valuation of Coal Lands

I want to thank Francis G. Welles for presenting in a different form a clear analysis of the operating figures used in my article published in *The Colliery Engineer,* September, 1915, p. 64, entitled "The Valuation of Coal Lands." Mr. Welles's objection to my manner of using these figures appears to be directed at the extension I have given to the usual definition of the term "profits." Mr. Welles states, in part, as follows: "There is only one state of affairs when interest on the investment may properly be charged against operating cost, and that is when a portion of the capital has been borrowed."

In the balance sheet under discussion I have simply carried this state of affairs a step farther and assumed that all of the capital has been borrowed. Such a state of affairs is by no means uncommon in the coal industry, although it seldom occurs at the beginning of operations. Later, when adequate production is assured, it happens with some frequency. However, if it had never happened, I think it would have still suggested itself to an engineer as a ready means of determining the commercial status of a given mining proposition.

The risks inherent in any coal-mining proposition demand profits in excess of the rate of interest current in the locality in which it is found, for the reasons set forth in the article. It is the excess with which my balance sheet concerns itself. While technically it shows only the profit of the *entrepreneur,* known as the operator in the coal industry, practically it shows and names as profit that portion of income without which the proposition is valueless. Profit is necessary, not only as a reward for the experience, enterprise and business sagacity of the operator, but as an inducement to capital to turn aside from investments that promise far greater security.

I think that, without impairing the value of the method to the engineer for trying out the working value of mining propositions, I may agree with Mr. Welles's contention that, as industrial operations are customarily financed, my balance sheet covers up some of the technical profits.

Pittsburgh, Penn. W. E. Fohl.

⁂

Handling Explosives in Mines

Letter No. 3—When reading the short editorial that appeared in *Coal Age,* Vol. 7, p. 937, inviting discussion by men of experience in the handling and use of explosives in mines, I concluded that this would make a very interesting and instructive subject:

Practice in the Cahaba Coalfield

Having had some years of experience in the handling of all kinds of explosives, I want to offer a few comments on the general practice of blasting coal in the Cahaba coalfield, in what is known as the "Eureka Basin," 18 mi. from Birmingham, Ala. Here, the main slope entries are driven to the full dip of the seam and water levels turned to the right and left off the main slope. The rooms are driven to the rise of these levels, on all inclinations from 5 to 75 deg.

The seam known as the "Helena seam" will average 4 ft. in thickness, and the general practice has been to shoot the coal off the solid, using black powder and fuse. Except in one or two places, squibs are not used to fire the shots. The miners claim that fuse works better, owing to the wet condition of the holes in this seam. The attempt to use permissible powder, in this seam, has only met with partial success. The miners claim that, first, it is too expensive and, second, it does not give as good results in breaking down the coal. Many of the operators also claim that, by the use of black powder, better grades of coal are obtained for domestic use. The mines load three grades of coal—namely, lump, nut and slack—the slack being much used for steam purposes.

System of Handling Explosives

The system adopted for the handling of explosives at the mine is as follows: The miner gets his powder at the magazine in the morning, from 6 to 7 o'clock. Each miner, before going into the mine, leaves his supply of powder at the tophouse, marking the powder with the number of his heading and room. The drivers deliver to each man his supply of powder, which is placed at once in his box, and the latter is locked. A miner is allowed to keep on hand only one keg of powder or one carton of stick powder. They make their own cartridges, using a stick 1½ in. in diameter for this purpose.

Blasting the Coal in Two Benches

The Helena coal seam is composed of two benches of coal, which are separated by a 4-in. parting. The bottom bench being the hardest and strongest coal, it is the general practice to shoot the top coal first. The work is carried forward, thus, in two benches or steps, the face of the top coal being kept a short distance in advance of the lower bench. The general practice in blasting the coal is to drill a hole not over 6 ft. in depth and so inclined toward the loose end that the shot will not measure over 4 ft. at the heel. At times, shorter holes are fired, depending on the coal to be broken down. Clay is furnished the men for tamping.

Bad Practices in Shooting Coal

There is a bad practice among heading men, who quite generally adopt what is known as a "cracker shot." The hole is drilled straight in the solid coal a distance of 6 ft. In some cases, two such holes are drilled one above the other, and this is known as a "double cracker." The coal is then mined or sheared 3 ft., leaving the other 3 ft. of the hole in the solid coal. When this shot is fired with "monabel" the coal that is mined or sheared is broken down, while the coal behind this is cracked by the explosion of the charge, which is located in the solid.

This practice, while dangerous, affords the miner easy cutting for the next shot. The mine inspectors have condemned the practice and are striving hard to bring about its disuse; but, as one of them stated to me not long since, it is difficult to enforce discipline in the mine. It is easy to see that if both the operators and the miners would take the precautions suggested by the inspectors, accidents resulting from blasting would be reduced to a minimum.

There is always danger of a windy or blownout shot when blasting coal off the solid, or whenever the powder is not given an opportunity to perform its work. Blasting off the solid requires the best judgment of an experienced miner, having a thorough knowledge and acquaintance with the kind of coal blasted, in order to avoid what is known as a "tight shot." An inexperienced miner will often increase the charge of powder, with the result that the shot blows its tamping or pulverizes the coal, producing much fine dust.

Another bad practice in this district is the firing of two or more dependent shots. It frequently happens that the second shot goes off before the first or the first shot may fail altogether. In either case, the result is almost sure to be a blownout shot.

Let me suggest the precaution of making up all cartridges outside of the mine, these cartridges to be carried into the mine in canisters. I would also recommend that every hole should be examined, charged and fired by a competent person. When miners charge and fire their own holes, they frequently tamp these with coal dust, which produces a large amount of flame when the shot is fired and burns up the oxygen of the air to such an extent that the place is unfit for work the next day. I have often had my light extinguished when examining a place owing to this practice of miners.

Maylene, Ala. ROBERT GIBSON.

⁂

Efficient Mine Foremen

Letter No. 11—In discussing the efficiency of the mine foreman, the question should not be limited to his proficiency in the ventilation of a mine, as would appear from the first letters written on this subject. There are many other things that an efficient mine foreman must know that will measure his capability for filling successfully that position.

VENTILATION AND EFFICIENCY

It is true that good mine ventilation forms an essential part of the work of a successful foreman; but, however thorough the ventilation of the mine, if other important things are neglected, the foreman in charge could not be styled "efficient."

To illustrate this point, while district mine inspector I visited a small mine where the ventilation was very defective, owing to the neglect of necessary doors and brattices in the mine. The foreman in charge had been there but a few days and promised that he would improve the ventilation in a short time, which he did in a satisfactory manner. A little later I had occasion to call the attention of an operator of another small mine to the need of better ventilation and, in doing so, referred to the improvement that had been made in the mine I have just mentioned. The superintendent asked the name of the foreman who had made the change and, on being told, replied: "Yes, I know that fellow. He is certainly good in ventilation, but a complete failure in everything else connected with a mine." Later developments proved this to be the case.

A mine foreman may improve the conditions in regard to ventilation and at the same time permit the mine to become dry and dusty to a dangerous extent. Or he may look closely to the ventilation and keep the mine free from dust as well, but neglect his haulage roads and the drainage of the mine, until the output of coal is so reduced that the mine is no longer operated on a paying basis.

WHAT EFFICIENCY IN MINING MEANS

A good definition of the word "efficiency," in reference to the operation of a mine is the ability to accomplish what one undertakes and thereby reduce the cost of production. An efficient mine foreman is one who has attained a high average in all things pertaining to safety and economy in mining. In the operation of the mine the efficient foreman looks both to the interest of his employer and that of the men in his charge. He neglects no duties that pertain to his office and, as far as possible, permits no condition to exist in the mine that will endanger the life or impair the health of the men in order that the output of coal may be increased a few tons or the expense account reduced a few dollars. He is a close observer of what goes on in the mine, a student of conditions and a hustler. He is well qualified to deal successfully with the problems that arise.

FOREMAN NOT ALWAYS TO BLAME

In considering the high standard of efficiency required of mine foremen, we are prone to forget that many of his acts are directed by his superiors in office, in opposition to his own best judgment. The foreman is often adjudged inefficient because of the delay in making improvements that are greatly needed when, in fact, if the material was at hand and he was permitted to follow the dictates of his practical judgment, the needed work would have been performed and the conditions improved. In such cases it is the man higher up that should be censured and not the foreman.

I was pleased with Letter No. 5, by Thomas Hogarth, in which he urges the telling of the plain truth in answer to the questions of the superintendent or general manager in regard to conditions existing in the mine. This can be done in such a manner as to testify to the efficiency of the foreman. As a rule neither of these officials makes frequent visits to the mine, and consequently knows little of what is needed underground, except by the reports of the foreman and his assistant. The manager's aim and desire is to increase the production while decreasing the cost of operation.

A PRACTICAL ILLUSTRATION

Several years ago an inside foreman persistently pointed out to the superintendent of a certain mine the unfavorable conditions that prevailed in sections of the mine. The foreman insisted that these dangerous conditions should be arrested at once as a precautionary measure of safety. The general manager, knowing nothing of those conditions existing in the mine, was pushing the superintendent for a greater output of coal and a reduction in the cost of operation. The superintendent, not having the courage to inform the general manager of affairs existing underground, postponed from day to day the work recommended by the foreman and urged as necessary for the safety of the mine. The conditions grew gradually worse, and it is clear to every practical mining man that had this superintendent made plain to the general manager the necessity of making the changes needed, even though the work should curtail the output of coal, the disaster that occurred in that mine later would have been averted and lives would have been saved.

JOHN ROSE,
Dayton, Tenn. Former District Mine Inspector.

Gaining a Maximum Tonnage

Letter No. 1—In working out the problem of securing a maximum output of coal per ton per man, the coal-sheet on the tipple is a good starting point. For instance, note the check numbers of the loaders who put out less than the average number of cars on the preceding day. Then go into the mine and ascertain from each of these men the reason why he loaded less coal than the average the previous day.

By extending these inquiries in this manner over a period of several months and arranging the reasons given for loading less coal, it will be found that these can generally be classified under the following heads: (1) Cars come too slow. (2) Place not cut by machine. (3) Track not fixed in room. (4) Bad air and smoke. (5) Place working badly. (6) Quit on account of sickness.

SLOW DISTRIBUTION OF CARS

Delay in getting cars to the working face for loading may be owing to a number of different causes, such as poor roads, balky mules, incompetent drivers, a poorly arranged system of haulage, rooms widely scattered, motor troubles and derailment of cars. When everything is working properly underground, the delay may be owing to congestion on the sidetrack or at the shaft bottom because of a cessation of dumping at the tipple owing to lack of railroad cars.

Most of the causes mentioned can be eliminated by proper attention on the part of the mine foreman and his assistants, whose duty it is to see that the roads are in proper condition, that good rolling stock is mantained and that good mules, competent drivers and motormen are employed. If the work of the drivers is scattered over a considerable territory, this can generally be avoided by giving proper attention to the turning of rooms off the headings, in such a manner as to provide a sufficient number of places to keep a driver busy on one entry or pair of entries.

Where it is necessary to work the entries back on the retreating system, the first rooms can be turned and worked up a short distance, when the miners from these places are shifted ahead as quickly as the entries are advanced sufficiently to permit new rooms to be turned. In this manner, a sufficient number of rooms can always be kept working to keep one driver busy on a single entry or pair of entries. Special attention should always be given in the development of a mine to the consolidation of the work.

WORK OF THE DRIVERS

There is great need of systematizing the work of drivers in a mine. The driver works by the day, while the loader is paid by the ton or the number of cars loaded. As a result loaders generally finish their work and quit the mine before it is time for the drivers to leave. This gives the drivers a chance to clean up the coal and to distribute the empty cars in the rooms, ready for loading in the morning. It frequently happens, however, that there is a disposition on the part of drivers to leave this work to be done in the morning, which causes much delay in making a start the next day.

To insure a good day's run, there should be plenty of coal on the bottom or at the tipple ready for dumping when the whistle blows in the morning, and each miner should have his supply of empty cars at hand ready for loading when he enters the mine and proceeds to work. It will often be difficult for a foreman to enforce this system, inasmuch as he is busy on top getting things started and cannot enter the mine for an hour or more in the morning. He must therefore delegate this work to the boss driver or other assistant and hold him responsible for putting the coal on the bottom in time for hoisting each morning. As mine foreman I have made many trips through the workings after hours to satisfy myself that the drivers were doing their duty and that the empties were placed ready for loading in the morning.

WORK OF THE LOADERS

The loader generally has his little whims, which it is better perhaps to respect than to attempt to analyze for correction. He likes to start early and load his coal rapidly, and any delay in getting cars breaks the charm, and his work is then done in a half-hearted way, with the result that he quits early, determined to get a better start the next day.

Again, nothing is gained by overloading a driver by putting more men on his run in hopes of increasing the number of cars hauled. A foreman should know how many cars a good driver can haul on his run in a single shift, and this should limit the number of men that can work in his territory and give satisfaction all around. Overloading a driver's run will generally produce confusion and interfere seriously with the systematic hauling of the coal, and this in turn will affect and dissatisfy the loaders, who will cease to put out their regular supply of coal. What I have said about the charm under which the loader works may seem pure sentiment to many, but it is nevertheless the deep philosophy of the men who load the coal at the working face. Attend, therefore, to the placing of the first car in each room in the morning.

WORK OF CUTTING THE COAL

Where the coal is cut by machine, it is important that each miner should square up his place ready for the machine-runner. If this is not done, the loader is very apt to find his coal is not cut when he comes to work the next day. A machine-runner who cuts coal by the ton or car will give the most attention to those places that are properly squared up and ready for cutting. The best results are obtained when every loader understands the importance of being ready for the machine. Many loaders give this matter little or no attention. Instead of arranging their work accordingly, they will continue to load all their loose coal until the last car is loaded, before starting to square up in readiness for the machine.

WORK OF THE DAYMEN

Although contrary to the modern policy of division of labor, it will frequently be found of advantage to have a crew of daymen available for any kind of work that may be required of them, from laying a track to driving a mule. It is possible for loaders to devote much of their spare time to cleaning up the track in their rooms and repairing it when necessary, which would be to their own advantage as it would facilitate the movement of the cars in and out of the rooms. By so doing, men can do much to increase their regular daily output of coal. A working place is not in good shape when it requires handling the coal two or three times before it can be loaded into the car, because the track does not reach the face of the room.

Again, in the operation of every mine there are good and bad places, and the mine foreman often finds it expedient to make allowances in the working of hard places. The best of judgment is required in doing this, in order to treat all men fairly and with equal justice. The bad places must be worked, and it is often better policy to pay a good miner something extra to work the place than to give it to a less experienced miner or the last man on the job. In my opinion it is a bad policy to put a newcomer into the worst place in the mine. These men should be given an even chance with the old loaders, in order to secure permanent recruits and maintain a good force of loaders that will be always available when conditions require.

There is a certain knack in shoveling coal, and it will be found worth while to employ an experienced man whose duty it will be to train green loaders and to show them how to handle a pick and to shovel coal. A good loader can handle a pick or shovel equally well in either hand. He knows how to use both his back and legs when shoveling, instead of doing all the work with his arms. Such a training as I mention here will develop a good class of loaders who will be able to mine and load more coal in a day than is possible without such training.

The course of training should include the location, drilling, charging and firing of shotholes so as to produce the best results. I have seen men who weigh not over 125 lb. load eight 2-ton cars of coal by 4 o'clock and be ready to do the same thing the next day. I have seen other men, husky fellows, who were hardly able to finish loading six cars because of their inexperience in the handling of pick and shovel.

Digging is an important part of the work of the loader. All cutting machines leave a bottom coal to be taken up, and no shot brings down all the coal. For this reason, the work must be squared up as the face is advanced, and made ready for a new cut with the machine. The loader must be trained and shown the best manner to perform all this work.

GEORGE STOCKDALE.

Study Course in Coal Mining

By J. T. BEARD

The Coal Age Pocket Book

The Year—A year is the period of time in which the earth completes one revolution in its orbit.

The **solar year** (365 d., 5 hr., 48 min., 45.51 sec.) marks a complete revolution about the sun.

The **sidereal year** (365 d., 6 hr., 9 min., 8.97 sec.) marks a complete revolution with respect to a fixed star.

CIRCULAR MEASURE

60 seconds	= 1 minute	
60 minutes	= 1 degree	3,600 seconds
15 degrees	= 1 hour angle	900 minutes
30 degrees	= 1 sign	1,800 minutes
12 signs	= 1 great circle or circumference	360 degrees

The **"sign"** is one of the twelve divisions of the zodiac, which correspond to the twelve calendar months of the year. The sign has no practical value technically.

It is often convenient to express the length of an arc, or the angle it subtends, in terms of the radius of the circle. In that case, the unit of length is called a "radian." A **radian** is a length of arc equal to the describing radius. Its value expressed in degrees is $180° \div \pi = 180/3.14159 = 57.2958$ deg., or $57° \, 17' \, 44.88''$. Since the length of the circumference of a circle is $2\pi r$, there are 2π radians in a circumference or 360 deg.

Circular measure is used in the measurement of angles and in the estimation of **latitude, longitude** and **solar** or **sun time,** which varies from **standard time** according to the location of the observer.

Measurement of Time—The passing of time is measured by the revolution of the earth on its axis, as determined by the observation of the sun or one of the fixed stars when crossing the meridian of a place. A single revolution of the earth marks a period of 24 hr. or one day.

Sun Time—Owing to the inclination of the earth's axis to the plane of its orbit and the eccentricity of the orbit, the sun's apparent motion in the celestial sphere is not wholly uniform, on which account **solar time** is referred to a "mean **sun"** having an assumed uniform motion.

Equation of Time—The difference between the mean sun and the true or observed sun, expressed in hours, minutes and seconds, is called the "equation of time." This is found for any date in the "Ephemeris" or Nautical Almanac.

Sidereal Time—The apparent movement of the fixed stars, unlike that of the sun, is uniform, which makes the sidereal day correspond precisely with one complete revolution of the earth on its axis. About Mar. 21, or at the vernal equinox, sidereal time agrees with mean sun or solar time.

Local Time—When the 24-hr. cycle is referred to the local meridian as zero (noon or midnight) the indicated hour is the local time, or the time for that place only. Since there are 360 deg. in a circle, which marks 1 day or 24 hr. of the celestial equator, 1 hr. corresponds to $360 \div 24 = 15$ deg. Hence, a difference of 15 deg. marks a difference of 1 hr. in local time.

The Coal Age Pocket Book

Longitude, Latitude—Longitude is the distance either east or west of the **meridian of Greenwich,** which is marked by the Royal Observatory, and measured in degrees, minutes and seconds, on the equator. There are thus 180 deg. of **east longitude** and 180 deg. of **west longitude.**

Latitude is likewise distance north or south of the equator, measured in degrees, minutes and seconds, on any meridian or great circle passing through the poles. There are thus 90 deg. of north latitude and 90 deg. of south latitude.

Standard Time—To obviate the confusion caused by the difference in local time, a system of "standard time" has been adopted. Starting from the meridian of Greenwich, standard time is 1 hr. later for each 15 deg. of east longitude, and 1 hr. earlier for each 15 deg. of west longitude. Calling the equatorial circumference of the earth 25,000 mi., a degree of longitude represents a distance on the equator of $25{,}000 \div 360 = 69.4$ mi. Hence, 1 hr. (15 deg.) corresponds to a distance of practically 1,000 mi. at the equator.

In the United States and Canada, there are four divisions of standard time, known as **Eastern, Central, Mountain** and **Pacific time,** which are exactly 1 hr. apart. These are all referred to the observatory at Greenwich, which marks the zero of longitude.

Eastern time is the solar time of the meridian 75 deg. west longitude, and is the standard time for all places within 7½ deg. on either side of that meridian. Eastern time is therefore $75 \div 15 = 5$ hr. earlier than Greenwich time.

Central time is solar time for the meridian 90 deg. west longitude, and is likewise standard for all places within 7½ deg. east or west of that meridian. Central time is 1 hr. earlier than Eastern time.

Mountain time is solar time for the meridian 105 deg. west longitude and standard for all places within 7½ deg. east or west of that meridian. Mountain time is 1 hr. earlier than central time.

Pacific time is solar time for the meridian 120 deg. west longitude and standard for all places within 7½ deg. east or west of that meridian. Pacific time is 1 hr. earlier than mountain time.

When it is noon at the observatory at Greenwich it is 7 a.m. at New York, 6 a.m. at Chicago, 5 a.m. at Denver and 4 a.m. at San Francisco. At the same time it is 1 p.m. at Berlin and Rome, 2 p.m. at Petrograd and 8 p.m. in the Philippines.

Civil Time—The day, for all common purposes of reckoning, begins and ends at midnight. The 24 hr. are divided into two periods of 12 hr. each. The hours from midnight to noon are designated by the letters a.m. (ante meridian), and those from noon to midnight by the letters p.m. (post meridian).

Astronomical Time—The astronomical day is reckoned from noon to noon, the hours being counted from 1 to 24. The astronomical day begins 12 hr. later than the civil day, as the following comparisons will show:

Civil time,	Nov. 6, 3 a.m.;	Nov. 6, 3 p.m.;	Nov. 7, 3 a.m
Astronomical time,	Nov. 5, 15 hr.;	Nov. 6, 3 hr.;	Nov. 6, 15 hr

Inquiries of General Interest

Flow of Water in Pipe Line

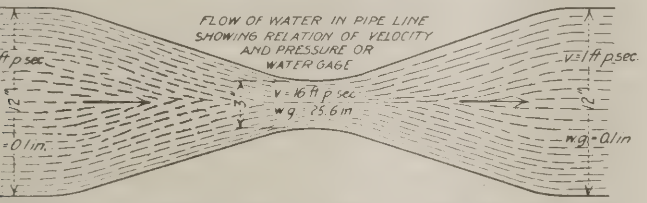
A horizontal pipe line having a diameter of 12 in. gradually reduces in cross-section to a diameter of 3 in., and then increases gradually to its original size. The water has a velocity of 5 ft. per sec. in the larger section of the pipe. I would like to ask, Neglecting friction, how does the pressure vary along the axis of this pipe? Also, does this reduction of sectional area affect the flow of the water in the pipe or reduce the quantity of water that will be discharged under the same head?

CONSTANT READER.

Mountain Park, Alberta, Canada.

Assuming a full flow of water in a pipe line under a constant head, a gradual reduction in the sectional area of the pipe, followed immediately by a gradual enlargement to the original area, will not materially affect the flow of water in the pipe. The velocity of the water at any point will vary inversely as the sectional area, or inversely as the square of the diameter at such point. In other words, the velocity ratio is always equal to the square of the inverse diameter ratio, which in this case is $(\frac{12}{3})^2 = 4^2 = 16$.

As shown in the accompanying figure, the velocity of the water at the throat, where the diameter of the pipe has been reduced to 3 in., is 16 times the velocity in the original section of the pipe.



FLOW OF WATER IN PIPE LINE SHOWING RELATION OF VELOCITY AND PRESSURE OR WATER GAGE

DIAGRAM ILLUSTRATING FLOW OF WATER IN PIPE

But in the flow of a fluid through a conduit, the pressure at any given point varies as the square of the velocity of the flowing medium. Hence, ignoring friction, the pressure at the throat of the pipe in this case is $16^2 = 256$ times the pressure in the original section before the reduction of area took place. This is in accordance with the principle of the well-known Venturi meter. There is practically no loss of energy owing to the contraction of the vein, providing the decrease and increase are gradual. The pressure head being converted into velocity head and *vice versa*.

Pittsburgh Coal Prices in the Cleveland Market

I have sometimes wondered why your Cleveland market report quotes Youghiogheny, while Pittsburgh quotes the "Pittsburgh district." Pittsburgh district includes Youghiogheny, as well as Monongahela, nearly to Brownsville. Cleveland could quote the larger district, because it is made by the railroads with a uniform freight, except of course that Youghiogheny coal is different in quality from Monongahela. I admit this is true to an extent, but I doubt whether a definite price difference exists, except sometimes in slack coal. The physical difference is that the Youghiogheny runs more as a gas coal and the other more as steam coal. As the freights are the same, the mining rate the same and there is always more coal mined everywhere than needed, the market has hardly any opportunity to establish a difference in price.

Pittsburgh, Penn. B. E. V. L.

The reason that Youghiogheny is quoted in preference to Pittsburgh district is because Youghiogheny is the standard western Pennsylvania coal in the Cleveland district. Some Pennsylvania steam coal comes in over the Pennsylvania Pan Handle and is known locally as "Pan Handle" coal. There is a small trade for Youghiogheny, mine-run and slack. There is a little domestic trade and a good lake trade. Youghiogheny is the standard lake fuel.

Fairmont coal is better known and more extensively used there than Pennsylvania bituminous coals. When the market is down, the West Virginia operators will underbid the western Pennsylvania producers. In a low market there is a good deal of Youghiogheny slack sent there, and some Pan Handle. The latter usually sells at five to ten cents less than the gas coal and is treated on the same basis as No. 8, which it very closely resembles.

Motor Trouble

I have had considerable trouble in the operation of a mine motor and would like to ask if you can explain the difficulty and tell me how to remedy it. The motor appears to get too much power when the controller is on the first point, which causes it to burn out.

Homer City, Penn. J. M. CONRAD.

The trouble is probably due to the motor being "hooked up" improperly; that is to say, the connections in the wiring are wrong. This is easily remedied by anyone having sufficient intelligence to investigate the matter. If the system is not thoroughly understood, however, a diagram of the wiring can be obtained from the makers of the machine.

The fact is there is not sufficient resistance in the circuit when the controller is on the first point, and as a result too much current flows through the motor before the latter has picked up speed sufficient to generate the required amount of counter-electromotive force, which takes the place of the resistance after the motor has attained its full speed.

It is important to always protect the circuit by fuses, so that in case anything is wrong in the connections, it will not result in burning out the motor, which will be prevented by the melting of the fuse and the consequent breaking of the current.

Examination Questions

Miscellaneous Questions

(*Answered by Request*)

Ques.—Explain by means of a sketch the proper arrangement of a blowing fan and its connection with the downcast shaft, assuming the mine is generating gas and a possible explosion may destroy the fan.

Ans.—As shown in Fig. 1, the fan should be set back a suitable distance from the top of the shaft, which is surmounted by explosion doors opening upward and designed to relieve the pressure owing to the explosion and thus prevent the destruction of the fan. As shown in the figure, the fan wheel is surrounded by a spiral casing that expands regularly from a point a short distance from the cutoff *c*. From *c* to *b* the casing is concentric with the fan wheel, the expansion starting at *b*. The distance *cb* must not be less than the distance between two consecutive blade tips, in order to prevent the back-lash of air at this point.

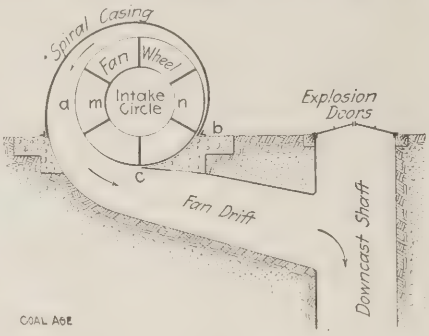

FIG. 1. SHOWING POSITION OF FAN

Atmospheric air enters the fan by the intake circle, and passing through the compartments between the blades, flows around the fan in the direction of rotation, as indicated by the arrows. The curve of the spiral casing is continued on the floor of the fan drift, which has a slight inclination toward the shaft. The center of the fan should be set back about 50 ft. from the shaft. The fan is partly sunk in a pit lined with concrete walls, which furnish a good foundation for the fan and the building or fan house.

Ques.—Are you in favor of the use of mixed lights in a mine where explosive gases are generated? Give full reasons.

Ans.—No. Where safety lamps are required to be used in certain portions of a mine generating gas, with a few possible exceptions where the two portions of the mine are widely separated, thereby affording ample protection against the gas finding its way from the section in which it is generated into the other section of the mine, the entire mine should be worked exclusively on safety lamps. The reason for this is the ever-present danger that in the operation of the mine an open light may find its way into the gaseous section of the mine; or the gas generated in that section may be forced back into the other section of the mine by reason of a local explosion in the first section, or by an unprecedented fall of roof in that section, or by the setting open of the division doors and the consequent disarrangement of the ventilation. Again, the fact that gas is generated in these measures makes it possible that gas may be generated in those parts of the mine where it has not previously appeared. This may occur at any time and perhaps because of a general subsidence of the roof formation or as a result of a squeeze or creep extending more or less throughout the mine. These reasons are sufficient to require the exclusive use of safety lamps in a mine any portion of which is generating gas in such quantities as to require their use in other parts of the mine.

Ques.—How often is it desirable that a boiler should be cleaned?

Ans.—The frequency of cleaning a boiler will depend upon the purity of the feed water used. It is important that boilers should be cleaned at regular intervals. In the great majority of cases, the cleaning of the boiler should not be delayed for a period longer than one week, and in many cases more frequent cleaning is necessary.

Ques.—What is a steam separator, and why is its use desirable?

Ans.—A steam separator is an arrangement or device for separating the entrained water from the steam before the latter is permitted to pass into the cylinder of the engine. The use of a separator provides comparatively dry steam and prevents the accumulation of water in the steam line and the cylinder. When water is permitted to accumulate in a steam cylinder, there is danger that the cylinder head may be knocked out by the movement of the piston to and fro in the cylinder, the water being incompressible.

Ques.—Describe the process of forepoling used in driving a heading under a tender roof in a mine.

Ans.—This system is shown in Fig. 2. The props *A*, *B* and *C* are set at regular intervals as the heading is advanced. In order to prevent the frail roof from falling between the timbers, flat spiles *a*, *b* and *c* are driven in consecutively over the last collar set next to the face of the coal. These spiles are formed of 2-in. planks 8 or 10 in. wide and sharpened at one end to facilitate their driving. The figure shows the manner in which the spiles are driven up in order as the face advances.

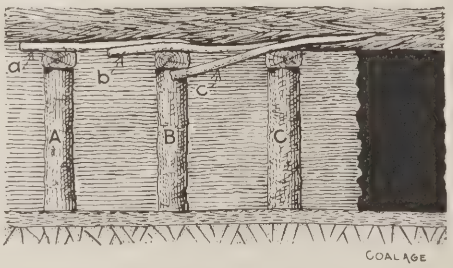

FIG. 2. METHOD OF FOREPOLING

Ques.—What is the chief thing to be remembered while wearing an apparatus?

Ans.—Your own safety and those that are with you; also, that men caught in a mine explosion or fire should not be considered as dead until life is found to be extinct. It is important to note constantly that the apparatus is working properly and that the supply of oxygen remaining is sufficient to enable you to make good your escape to the surface, making due allowance for unavoidable delays.

Book Reviews

Book on Smokeless Combustion

COMBUSTION AND SMOKELESS FURNACES. By Joseph W. Hays. Pp. vii + 116 + 2 index; 6¼x9¼ in.; 21 illus. Second edition (revised). Joseph W. Hays, publisher, Rogers Park, Chicago. Cloth boards, $2.

Remembering a lively little book on a similar subject entitled "How to Build Up Furnace Efficiency" written by the same author and reviewed in the issue of "Coal Age" of Nov. 14, 1914, the reviewer expected much pleasure in the perusal of the volume about to be discussed. The book being reviewed makes more pretentions than the other, but is disappointing for one cannot but realize that Mr. Hays is at his best in the furnace room and not so much at home when he begins to discuss chemistry and thermodynamics as abstract sciences, as he endeavors to do in parts of the present volume.

The first of all his difficulties is his wrong conceptions about the "absolute zero." This point on the thermometric scale is purely an abstraction, about as dependable as the point on the chronometric scale once volubly pointed out by a conductor on a "tin lizzie" street car plying between St. Johns Place and Borough Hall in Brooklyn. The happy Teuton who presided over this pretentious vehicle was dancing round the post which serves to operate the doors and hold the nickels and was joyously proclaiming—this was in August a year ago—that in five days the Germans would be in Paris.

Now he had every reason to figure that given a continuance of the phenomena which were up to that time apparent the Germans would enter Paris in five days, but he overlooked some countervailing conditions, and only a few days afterward it looked as if in a month the Allies would enter Berlin, which indication also failed of realization.

ABSOLUTE ZERO ONLY AN ABSTRACTION

It is somewhat similar with the absolute zero. The phenomena around ordinary temperatures point unerringly to a certain conclusion, but when lower temperatures are reached, the countervailing conditions modify these phenomena considerably. It appears that at 0 deg. C. a gas shrinks 1 part in 273.7 for every decline of 1 deg. C. and that the denominator 273.7 should be increased by adding the scale temperature to obtain the contraction per degree Centigrade at any other normal temperature.

It is extremely easy to fall into the error of believing that as this is true for all perfect gases and for reasonably large ranges of temperature it is true to the limit so that a gas will be without volume whatever at —273.7 deg. C. As the gas has shrunk to nothingness it can have no molecular motion and hence no heat and the temperature attained has accordingly been termed the absolute zero. But no thinking man ever believes gas so retiring as to dissolve into nothingness, and no one ever had any right to proclaim this point an absolute zero; for if the gas ceased to exist, it could have no temperature, and if it continued to exist, there was nothing to prevent a belief in a still lower temperature. In fact, the so-called "absolute zero" has been reached within a few degrees since the concept was first put into writing, and there is no evidence at such low temperatures that the law of shrinkage holds good or that there are not profounder temperatures yet possible in both theory and practice.

But we are troubled to know what to say, for after all what does Joseph W. Hays really mean? On page 3 he says, "There is no point strictly speaking when heat ceases and cold begins," and on page 4, he declares that "at this point [that at which he suggests that motion is at an end] what we call cold ceases—it cannot get any colder—and heat has its origin or beginning. This point has been definitely fixed by scientific calculations. It is 273.7 deg. below the zero of Centigrade. It is known as the absolute, or true, zero of heat energy." So on page 3 he tells us that there is no point at which heat begins, and on page 4 assures us that there is such a point. Both statements cannot be correct. Which guess is the right one no one knows, but certainly —273.7 is not that limit. It is nothing but a convenient basis for figuring.

On page 7 of the book which is being reviewed is to be found the veriest piece of spreadeagle Americanism: "Many of the highest authorities in physics and many of the American schools have adopted the Rowland determination [of the mechanical equivalent of heat], while others adhere to the final figures given by Joule." There is nothing objectionable so far; but then follows: "The Joule unit is generally accepted in Great Britain, and it would accordingly seem consistent to follow the British standard or cease reckoning in 'British thermal units' and adopt a unit of our own. As the Rowland experiments were conducted at Baltimore, it would be easy for those who prefer the Rowland figure to substitute 'Baltimore' for 'British,' and thus, while not abandoning the abbreviation 'B.t.u.' make plain what they mean when referring to a thermal unit."

BALTIMORE THERMAL UNITS NOT NEEDED

A remarkable suggestion and one which would be worthy of some consideration if we were accustomed to conduct our calorimetric investigations by finding what work a pound of fuel would do and if we then determined by the Joule or the Rowland mechanical equivalent the number of thermal units generated. As a matter of fact we do no such thing. We take the coal, burn it and see what heat it develops, and if Joule and Rowland were 100 per cent. wrong in their determination, the number of thermal units credited to a pound of fuel would not be one more or one less. For your information, Mr. Hays, the word "British" applies to the pound and to the Fahrenheit degree and not to the mechanical equivalent of heat, the people of the United Kingdom and of this country also being unfortunately wedded to these undesirable units, though of course the latter monstrosity hailed from France. To their credit the French people knew enough to take up with a somewhat better unit introduced by a Swede.

After all, when we now use "British thermal unit" and "calorie," we rarely refer to the pound or the gram at all; for the water raised 1 deg. Fahrenheit or Centigrade, as the case may be, is usually figured in like units to those used to measure the fuel burned.

Perhaps it might be as well to replace the term "British thermal unit" by "Fahrenheit thermal ratio," for when we say that a coal gives 14,000 thermal units we mean that a unit by weight of that coal will raise 14,000 units by weight of water 1 deg. Fahrenheit. The unit of weight, whether ounce, pound or ton, is not considered. It is not a number of units which we have, but a factor; and when we want calories in place of British thermal units, we pay no attention to the relative size of the gram and pound, but divide by 1.8, the ratio of the units in the thermometric scale. So after all, "British" is a misnomer and "Baltimore" a still greater folly.

SUMMARY OF THE SUBJECTS TREATED

Having done what a censor of technical books should do before they are published, if he had the time to do it, it is necessary to say something about the book itself, which it must be confessed is far better than the extracts just quoted. It commences with "Heat and Combustion" and then discusses "Combustion and the Boiler Furnace." Very clearly Mr. Hays shows that the work of the furnace is separate from that of the boiler, and he treats the relation between combustion and its calorific effect in another chapter.

In the "Chimney Evil," he deals not with smoke so much as with the carbon monoxide which is in that smoke. The generation of this monoxide is a greater cause of the inefficiency of a furnace than is the generation of dense smoke, and the author suggests that the diffusion of the monoxide through the air may do more harm than fuliginous clouds of soot.

Then he discusses all the failings of different classes of furnaces, both mechanical and hand-fired, and none of them escapes scathing criticism. Be it understood, however, that he speaks always of types and not of specific makes, and being generalizations his descriptions of the methods of operation and application are sometimes not as clear as one might wish. The illustrations are the merest sketches, exhibiting boiler settings rather than grates.

Still the reader will find much sterling wisdom, for Mr. Hays is an extremely practical engineer with an original point of view and firm convictions. In the final appendix he discusses as a sort of afterthought flue-gas analysis, the effect of soot in preventing radiation of heat and the use of soot cleaners in water-tube boilers. Mr. Hays is never uninteresting; he is always practical, and his book cannot fail to be of great profit.

Coal and Coke News

Harrisburg, Penn.

The anthracite coal tax of 1913 was declared unconstitutional by the State Supreme Court on Oct. 28, and as a result the state will lose nearly $10,000,000 in taxes. The opinion, written by Justice Stewart, reverses the decision of Judge Kunkel, of the Dauphin County Court, rendered several months ago, the local jurist holding the act constitutional and valid.

The act, which levies a 2½ per cent. tax on anthracite coal mined, was operative for two years, or from July 1, 1913, to July 1, this year, when it was supplemented by the Dawson Act of 1915, which provides a similar tax, but provides that instead of dividing the tax among all the municipalities of the anthracite region, the tax shall be split 50-50, the state sharing with the municipalities that produce the fuel.

Coal companies from the start opposed the imposition of the tax and hundreds of appeals from the settlements of Auditor-General Powell were filed in the Dauphin County Court. The conclusion reached by Judge Kunkel, however, was based on the case of the Alden Coal Co. involving the collection of $7,792.76, due for the six-months period from July 1 to Dec. 31, 1913.

Judge Kunkel in his opinion held that the act was crudely drawn in that there was no express requirements that the operator shall pay the tax.

Only $20,000 has been paid into the state treasury by the anthracite coal companies under the act, and all of this under protest. This money will probably be returned by a special act of the next legislature, but there is no possibility that the $9,000,000 or more collected by the coal companies can be paid back to the consumers. It is said on an average of 10 to 15 cents a ton was charged by the operators to cover the amount of the tax. Under the coal tax act of 1915, the collection of the tax under the act of 1913, expired July 1, this year, so that the excess charges of the coal operators covered a period of two years.

Justice Stewart's opinion was not unanimous, for Justices Porter and Frazer dissented. In reversing the Dauphin County Court, Justice Stewart said in part:

> "When the necessary effect of the legislation is to create inequality of burdens as we here see it, are those complaining of the injustice to receive no other answer than that while the constitution promises them equality in the matter of taxation, that because it failed to place restriction upon the legislature's right to distribute the tax it collects, that therefore the purpose of the legislation is not to be inquired into? If constitutional requirements are to be circumvented by such simple and easy process of reasoning, the question may yet be asked derisively of the constitution, 'What is all this worth?' "

Just what effect the decision will have on the 1915 act is not known, although it is said that the latter may be declared unconstitutional.

So far no settlements under the 1915 law have been made, but many of the coal companies have protested against the provisions of the new act requiring statements of coal mined.

As soon as it is settled that no appeal will be taken by the state, some companies will make an effort to return to the consumers the tax collected under the 1913 act, but if the state attempts to collect the tax under escheat proceedings no tax money will be returned at present.

Jersey Central Must Sell Lehigh & Wilkes-Barre

The United States District Court on Oct. 28 decreed that the ownership of the Lehigh & Wilkes-Barre Coal Co. by the Central R.R. of New Jersey is a combination in restraint of trade and that the Central company must dispose of its interest in that concern.

The decree filed by the court is on the decision of the court last June in the government's anti-trust suit against the Reading company, Jersey Central and others. The court at that time suggested that the Lehigh & Wilkes-Barre company be divorced from the Jersey Central.

As the subject of this separation was not argued when the case was heard, the court in its decision last June suggested it for consideration of counsel when the scope of the decree came to be determined. There was a difference of opinion as to in what form the decree should be and the court on the above date decided that the union of the Philadelphia & Reading Coal & Iron Co. and the Lehigh & Wilkes-Barre Coal Co. through the instrumentality of the Reading company is a combination in restraint of trade and violates the anti-trust act of 1890.

The Reading company, a holding corporation, owns all the stock of the coal and iron company and a majority of the stock of the Jersey Central, the last named in turn owning a majority of the stock of the Lehigh & Wilkes-Barre Coal Co.

The court decreed that after 90 days from date the defendants must submit a plan for the disposal by the Jersey Central of all the stock and other securities of the Lehigh & Wilkes-Barre Coal Co. now owned by it unless an appeal is taken to the United States Supreme Court. If the defendants fail to present a plan the court will take such further steps by receivership or otherwise as may then seem necessary.

Pending the disposal of the Lehigh & Wilkes-Barre Coal Co.'s stock, the Jersey Central, the Reading Co. and all other corporations controlling any stock are enjoined from voting it.

PENNSYLVANIA

Anthracite

Weatherly—The Lehigh Valley Coal Co. has commenced work on the construction on a drainage tunnel in an effort to clear its workings of water at Buck Mountain.

Williamstown—The forestry services of the Pennsylvania R.R., the Philadelphia & Reading Coal & Iron Co., the Lehigh Valley Coal Co. and the Susquehanna Coal Co. were represented at the meeting of the timber owners of Dauphin County on Oct. 26, and organization of the Susquehanna Forest Fire Protective Association was completed. The forestry protective department of the Pennsylvania R.R. includes about 10,000 acres of woodland; the Philadelphia & Reading Coal & Iron Co. preserves comprise about 15,000 acres and the Susquehanna Coal Co. timber holdings cover some 5,000 to 10,000 acres.

Tamaqua—After an idleness of 8 days the 600 employees of the Maryd Coal Co., at Maryd colliery near here have resumed work. The trouble originated over the handling of grievances by the mine committee of the mine workers. Three "locals" are formed by the men at this colliery and of this number the Maryd local claimed the larger percentage of employees and appointed the mine committee. This committee, it was claimed by the other two locals, would not handle their troubles, when asked again and again, and when the two locals composed of the other employees endeavored to have the committee replaced by one of their selection, they were met with a refusal by the company officials, who claimed that but one mine committee was all they were compelled to deal with. The company officials found that the dissenting locals had the majority of employees enrolled and they at once met the new committee. Upon the acceptance of the committee the men decided to return to work pending an adjustment of their trouble.

Shamokin—As the result of an explosion of a boiler, the fan and boilerhouse of the Susquehanna Coal Co., at Shamokin, was completely destroyed recently, causing a loss to the property amounting to $2,500. Charles Schlegle, a fireman in the employ of the company, was probably fatally injured.

Bituminous

Robertsdale—The Rockhill Iron & Coal Co. is installing a 500-kw. Kerr mixed pressure turbo-generator at the Woodvale plant, where a fireproof boiler- and power-house is under construction. Hoffman Bros. of Punxsutawney, have had two diamond drills at work on the company's property for almost two years and contract for two new slopes has recently been awarded to the S. J. Harry Co. of Connellsville. The East Broad Top R.R., over which this coal is shipped, is erecting a new transfer plant at Mt. Union equipped with conveyors, picking tables, etc., to handle an increased output.

Indiana—One of the worst car famines ever experienced by the coal operators of this part of the state has struck the Somerset and Indiana County coal fields, just at a time when the coal business was beginning to boom. It is stated by the operators dependent on the Baltimore & Ohio and Western Maryland railroads for shipping facilities from the Somerset County field that the car shortage last week amounted to about 30 per cent. In Indiana County it is stated that the shortage is leading to a curtailment of output, the mines working only part time, whereas they might be working full time on the orders now received. In Somerset County some of the coal is being stored in the hope that the car famine will soon be relieved.

Connellsville—The shipments of coke from the Connellsville region recently amounted to 437,000 tons per week while production only reached 428,000 tons. The region as a whole is operating at approximately 80 per cent. of its total oven capacity. The Connellsville coke operators are scouring the country for men to operate the idle ovens.

Work has been started in cleaning up the Gaylord mine of the Pittsburgh & Cleveland Coal Co.

Adamsburgh—The Edna No. 1 Mine of the Pittsburgh & Baltimore Coal Co. will shortly resume operations after an idleness of a year. It is reported that the company has several large orders booked which will mean steady employment for about 250 men.

VIRGINIA

Toms Creek—The Virginia Iron, Coal and Coke Co. has placed 550 ovens in blast at this place, and it is reported that others will be placed in operation at Inman and other localities in Wise County field. It is said that this activity is largely the result of preparations for blowing in the Max Meadows and other iron furnaces in southwest Virginia.

WEST VIRGINIA

Charleston—According to the statement of Earl A. Henry, chief of the Department of Mines, the operations of the United States Coal and Coke Co. in McDowell County have established a remarkable casualty record. It is believed that this is the best record ever made in West Virginia and it is said that it has never been equalled in the United States in the same character of mines. Employing 1,667 men, of whom 1,095 were foreigners, and producing approximately 1,618,490 tons of coal, only one man was lost through fatal accident in the fiscal year ending June 30. During the same period of time, 455 fatal accidents occurred in the entire state, the tonnage per fatality being 140,856 tons.

Huntington—All previous coal loading records on the Chesapeake & Ohio R.R. for a single day were recently surpassed when 2,875 cars were loaded with 145,300 tons. The nearest previous record was on Oct. 18, when 2,559 cars were loaded with 119,235 tons. It is expected that the loadings for October will exceed those for September which up to that time was the best month in the road's history.

Belington—The coal mines in Tygart Valley are showing great improvement. Plenty of work is in sight, and the miners who have been on the "watchful waiting" list are now selecting places. The Davis Colliery Co. has started to open the Junior mines which have been closed for some months. Preparations are under way at the Meriden mine for a large tonnage. Century, Lillian, Arden and Gage are working daily while Dartmoor and Weaver are working better than for many months. Other small mines are running to capacity and it is believed that by Dec. 1 all the mines and ovens in the territory will be in full operation.

KENTUCKY

Hartford—Neighbor Bros. have opened a 6-ft. vein of fine coal on the Taylor lands, near Beaver Dam, Ky., and are retailing lump and nut coal from the workings.

Bevier—The tipple at the mine of the Crescent Coal Co. was destroyed in a recent fire. Several weeks will be required in reconstructing this part of the plant.

Whitesburg—In order to fill the increased orders for coal from the fields around Fleming, McRoberts, Jenkins, Dunham and Haymond, several hundred men have been put to work in the mines during the past few days. It is said that the plant of the Elk Horn Mining Corporation of Fleming and Beaver Creek will about double its present output during the next three weeks, besides starting up the mines in Hemphill which have been standing idle for nearly 12 months. Practically the same conditions prevail in all the other fields of eastern Kentucky.

Haymond—In drilling for water near this town a rich flow of natural gas was discovered at a depth of a little less than 150 ft. It is generally believed that the Pottersfork section is rich in gas and will soon become a producing territory. It is said that a company will be immediately organized for the development of the property on a large scale. It is also believed that oil exists in this territory.

OHIO

Martin's Ferry—It is reported that all the idle mines in this section would, if operating, employ only about 2,000 men. This means that only the small mines are idle and that the coming of winter finds the men either employed at other mines or in other occupations. With two or three exceptions it is said that all the big mines in the entire field are working.

Bellaire—The Schick Coal Mine shut down recently by a strike has resumed work. The old check weighman complained of by the miners was put back to digging coal. The miners complained of the check weighman and elected a new one. When this man reported for work the company refused to recognize him and the miners struck. The strike was settled at a conference of the sub-district officials and mine owners.

Fairpoint—With approximately 100 miners employed the Fairpoint Coal Co. has resumed operation for the first time since the eastern Ohio coal strike was declared. It is said that conditions in the eastern Ohio coal field look much better than a month ago, and it is believed that a steady return to normal business will follow.

Athens—That officials of the Sunday Creek Co. believe there will be an adjustment of freight rates and the wage scale with the miners in the near future is indicated by the heavy expenditures made by the company. Tipples have been rebuilt at three mines already, and it is reported that new equipment for 10 of the 23 mines of the company in southeastern Ohio has been ordered.

Lathrop—Preparations are under way for the resumption of work at the mines of the Black Diamond Coal Co., at Lathrop, which have been closed since June 1. A force of men is engaged in cleaning up the mine, and 200 miners will be placed at work at once.

ILLINOIS

Belleville—R. W. Ropiequet, attorney of the St. Louis Coal Traffic Bureau, delivered an address recently to the Belleville Commercial Club on "The Railroad Situation and How It Affects Belleville." He spoke particularly about how Belleville's coal interests are affected by the railroad situation.

Hillsboro—State's Attorney Major has consented to drop the prosecutions begun recently against the pit committee of the local miners' union, charged with interfering with the employment of five miners who were members of the state militia. The state officials of the United Mine Workers of America have agreed to reinstate the militiamen, who had been suspended. They are to be permitted to remain in both the militia and the union and are to be compensated by the union for the time lost while they were under suspension.

COLORADO

Denver—The Bear River Coal Co., George N. Sparling, president, 732 Gas & Electric Building, Denver, who in July, 1914, filed on 160 acres of Government coal land in Routt County, Colo., and opened a mine at that time and has since been driving entries under the ruling that only development work could be done till the land was appraised and paid for, has succeeded in having this done and is now going ahead pushing the production of coal. The mine is located at Bear River. Shaker screens are being installed. The coal is 10 ft. thick.

WASHINGTON

Seattle—Suit to foreclose a mortgage of $250,000 on the properties of the Issaquah & Superior Coal Mining Co. has been started by a local bank which holds the mortgage. The bank bought the notes and mortgage last July at a sale held by the U. S. Marshal.

Auburn—It is reported that after several weeks of prospecting, J. G. Evans has found a rich bed of coal three miles northeast of Auburn. The coal bed is apparently 6 ft. or more in thickness and covers an unknown area. The coal is said to compare favorably with the best from the Black Diamond mines.

Chesaw—A bed of bituminous coal between 3 and 4 ft. thick has been encountered 7 mi. west of Molson by well drillers. The depth of the coal bed is approximately 90 ft.

FOREIGN NEWS

Copenhagen, Denmark—The Danish Government is taking steps to mine coal upon a commercial scale in Greenland. This is due to the fact that it is now difficult to buy English coal in Denmark, the coal famine being so serious that the government is planning to relieve the situation in part by cutting wood from the government forests. Coal has heretofore been mined in Greenland only in an experimental way, but the deposits in the opinion of experts are quite extensive. The heating quality of the fuel is, however, not regarded as equal to that of English coal.

PERSONALS

Van H. Manning will address a meeting at the Carnegie Institute of Technology at Pittsburgh, Penn., on Monday evening, Nov. 8.

F. W. Whiteside, of the Victor American Fuel Co. of Denver, Colo., has gone to California via New Mexico on a combination pleasure and business trip.

J. Ray Quinn for the past 6 years in the employ of the Central Fairmont Coal Co., recently resigned and accepted a position as manager of the Gano-Moore Coal Co., in Philadelphia, Penn.

F. J. Durdan, general sales agent of the B. S. Hamill Fuel Co., has severed that connection and will hereafter continue in the bituminous jobbing trade in Buffalo, N. Y., under his own name.

Hugh Gaffney, of Bridgeport, Ohio, formerly Deputy State Mine Inspector, has accepted a position as superintendent of Providence mine No. 1, of the Providence Coal Co., north of St. Clairsville.

F. L. Fenstemacher, assistant manager of sales for the Oliphant-Wasson Coal Co. will be in charge of a new office the company has opened in the Traction Terminal Building at Indianapolis, Ind.

D. A. Thomas, the Welsh coal operator, who is in America looking after ammunition shipments for the English government, has returned to New York from Canada. He is at the Plaza Hotel and expects to remain here for a few weeks.

D. D. Dodge, superintendent of the Carbon Coal and Coke Co., Cokedale, Colo., has gone to the coal fields of Pennsylvania to make an exhaustive study of the longwall conveyor in order to determine its adaptability to the Cokedale mines.

James R. Wooldridge, president of the Southern Appalachian Coal Operators' Association, has appointed a committee to look into the possibilities in the way of export business, seeking to land some of the large export orders for the mines of eastern Kentucky.

O. Tibbett, for many years superintendent of the Davis Coal and Coke Co., has tendered his resignation, and will retire from active mining operations. Mr. Tibbett takes this step on account of his advancing years, rendering the position which he has held for some time too arduous and exacting.

W. E. Hackett, of Spiro, Ark., recently resigned as mining engineer and assistant superintendent of the Bache-Denman coal properties, in Arkansas and Oklahoma, which are in the hands of a receiver and closed down, and is taking a trip through the Alabama, Tennessee and Kentucky coal fields.

J. M. Webb, in charge of first aid and rescue work instruction of the United States Bureau of Mines in Tennessee, southeastern Kentucky, and southwestern Virginia and West Virginia, with headquarters in Knoxville, Tenn., but who has for some time been residing at Birmingham, Ala., has moved his residence and family to 1907 Yale Ave., Knoxville. His office is at 232 Post Office Building.

Neil Robinson, of LaFollette, Tenn., receiver of the LaFollette Coal, Iron and Ry. Co. and the LaFollette Iron Co. returned recently from Boston, Mass., where he has been on business connected with these companies. The stock and bonds of these companies is held largely in Boston, and a movement is on foot by the Boston interests to reorganize these companies, together with the Co-operative Store Co., the commissary end of the LaFollette enterprises, into one company, with Mr. Robinson as president. It is expected that this deal will be consummated by the first of the year.

Edward J. Berwind, president of the Berwind-White Coal Mining Co., No. 1 Broadway, New York City, is one of the members of the newly formed Delectable Society of the Dotards of 1848, an even dozen of men born in 1848 who have achieved distinction either in commerce, finance or a profession. Each member holds an office in the organization. Mr. Berwind is described as follows in the roster of membership as it appears in the Dotards constitution: "Edward J. Berwind, official miner of the club; born June 17, 1848; president of the Berwind-White Coal Mining Co. and prominent in many large enterprises."

OBITUARY

Roswell G. Feltus, former general shipping agent, of the Philadelphia & Reading Coal and Iron Co., died suddenly in Philadelphia recently. Mr. Feltus was 75 years of age, was a veteran of the Civil War, in which he attained the rank of captain. He was also a member of many clubs and prominent in the affairs of the Episcopal Church.

Jacob P. Bauer, 69 years old, who was known to every river and coal man between Pittsburgh and New Orleans, died recently at his home, 3295 Montana Ave., Westwood, Ohio, after a short illness. He was for 40 years general manager of the W. H. Brown's Sons Coal Co., and after that concern was taken over by the Monongahela River Consolidated Coal and Coke Co. he was for 10 years local manager for that company. He retired about three years ago.

John J. Monaghan, 65 years old, a former district superintendent for the Philadelphia & Reading Coal and Iron Co., died on Oct. 24. He was born in England in 1850. At an early age he started to work in the mines and gradually rose from door boy to superintendent. He was retired about a year ago. He was a director of the First National Bank and president of the Shenandoah Building and Loan Association. A widow, four sons, all doctors of medicine and leading practitioners, and four daughters survive him.

RECENT COAL AND COKE PATENTS

Mining Machine. E. O'Toole. Gary, W. Va. 1,151,383 Aug. 24, 1915. Filed June 11, 1907. Serial No. 378,378.

Furnace. W. J. A. Muirhead, Seattle, Wash. 1,154,717 Sept. 28, 1915. Filed Oct. 22, 1914. Serial No. 867,981.

Coke Oven Door. E. C. Auld, Scottdale, Penn. 1,151,331 Aug. 24, 1915. Filed Apr. 3, 1914. Serial No. 829,323.

Mining Machine. B. Viviani, Monessen, Penn. 1,154,459 Sept. 21, 1915. Filed June 23, 1914. Serial No. 846,849.

Chimney Draft Device. E. Prat, Paris, France. 1,151,611 Aug. 31, 1915. Filed Aug. 29, 1913. Serial No. 787,315.

Mechanical Stoker. J. Van Vleck, New York, N. Y. 1,151,138 Aug. 24, 1915. Filed Feb. 20, 1915. Serial No. 9482.

Mine-Car Brake. C. E. Morgan, Holdenville, Okla. 1,154,041 Sept. 21, 1915. Filed June 24, 1915. Serial No. 36,097.

Rocking Grate Bar. C. R. Waid, Birmingham, Ala. 1,151,746 Aug. 31, 1915. Filed May 25, 1914. Serial No. 840,851.

Separation of Coal. F. W. C. Schniewind, Englewood, N. J. 1,152,442 Sept. 7, 1915. Filed Jan. 30, 1913. Serial No. 743,185.

Smoke-Consuming Furnace. C. H. Moore, Bellwood, Penn. 1,154,877 Sept. 28, 1915. Filed Feb. 26, 1915. Serial No. 10,706.

Brick Arch for Boiler Furnaces. C. F. Street, New York, N. Y. 1,153,648 Sept. 14, 1915. Filed May 22. 1915. Serial No. 29,873.

Purification of Coal. F. W. C. Schniewind, Englewood. N. J. 1,153,182 Sept. 7, 1915. Filed Dec. 19, 1912. Secial No. 737,689.

Fine Coal and Ore Separator. J. M. Draper, Manchester, England. 1,151,448 Aug. 24, 1915. Filed Apr. 4, 1914. Serial No. 829,581.

Miner's Safety Lamp. M. Albrecht, Frankfort-on-Main. Germany. 1,153,003 Sept. 7, 1915. Filed Nov. 24, 1913. Serial No. 802,819.

Downdraft Smoke-Consuming Boiler Furnace. C. H. Hook, Pittsburgh, Penn. 1,151,592 Aug. 31, 1915. Filed Feb. 3, 1915. Serial No. 5838.

Machine for Leveling Coal in Bee Hive Coke Ovens. J. H. Huhn, Fairmont, W. Va. 1,155,066 Sept. 28, 1915. Filed Mar. 5, 1910. Serial No. 547,441.

Apparatus for Electrically Igniting Miners' Safety Lamps. V. E. Joyce, London, Eng. 1,154,992 Sept. 28, 1915. Filed July 24, 1914. Serial No. 852,948.

Gas Producer. E. A. W. Jeffries, assignor to Morgan Construction Co., Worcester, Mass. 1,153,623 Sept. 14, 1915. Filed **Apr. 1,** 1909. Serial No. 487,355.

Coal-Mining Machine. C. C. Hansen, Assignor to Ingersoll-Rand Co., Jersey City, N. J. 1,154,922 Sept. 28, 1915. Filed Dec. 12, 1912. Serial No. 736,253.

Automatic Stoking Mechanism. D. T. Williams, assignor to Standard Stoker Co., Wilmington, Del. 1,152,682 Sept. 7, 1915. Filed Dec. 6, 1913. Serial No. 805,021.

Mechanism for Preparing Pulverulent Materials for Molding or Briquetting. E. B. A. Zwoyer and R. A. Zwoyer. 1,152,469 Sept. 7, 1915. Filed Oct. 26, 1908. Serial No. 459,577.

Mine-Car Wheel. W. D. Hockensmith, assignor to Hockensmith Wheel and Mine Car Co., Penn Station, Penn. 1,154,990 Sept. 28, 1915. Filed Mar. 6, 1915. Serial No. 12,562.

Machine for Making Briquettes. E. B. A. Zwoyer and R. A. Zwoyer, assignors to Zwoyer Fuel Co., a corporation of New Jersey. 1,152,468 Sept. 7, 1915. Filed Oct. 26, 1908. Serial No. 459,576.

INDUSTRIAL NEWS

Alton, Ill.—E. H. Smiley has been appointed at Belleville, Ill., as receiver for the Joseph Taylor Coal Co., of Alton.

Penn Station, Penn.—The Hockensmith Wheel and Mine Car Co. is now operating an addition to its plant and doubling its shop capacity.

Altoona, Penn.—Shipments of coke over the Pennsylvania R.R. lines in September amounted to 1,152,668 tons. For nine months coke carryings have aggregated 8,378,576 tons, an increase of 816,718 tons or 10.8%.

Washington, D. C.—The State Department is asking American railroads to cut off supplies of fuel to the enemies of the de facto government in Mexico as a supplementary proceeding to the embargo on arms and ammunition.

Cincinnati, Ohio—The Roberts & Schaeffer Co., of Chicago, recently closed a contract with the Campbells Creek Coal Co. for a 200-ton per hour Marcus patent picking table screen equipment for immediate installation in Putney, W. Va.

Wheeling, W. Va.—A freight car shortage is menacing the mining industry in eastern Ohio. Because of their inability to secure sufficient freight cars to handle the output, many operators have been forced to lay off miners or to work their mines only part time.

Summerville, Penn.—The Pennsy Coal Co. recently awarded a contract to the Roberts & Schaeffer Co. for a three-track frame constructed Marcus patent coal tipple with mechanical equipment for installation at Summerville. The aggregate cost of this structure will be $19,500.

Philadelphia, Penn.—The Federal District Court recently decided that the ownership of the Lehigh & Wilkes-Barre Coal Co., by the Central R.R. Co. of New Jersey was a combination in restraint of trade, and that the railroad must dispose of its interest in the coal company.

Richmond, Va.—The Norfolk & Western Ry. has placed orders for steel for the construction of 1,000 all steel coal cars, which are to be of the latest gondola type now in use on the road. The capacity of the cars will be 100 tons each, and they will be of the double-truck, 12-wheel type.

Philadelphia, Penn.—The Philadelphia & Reading Ry. has just let a contract to the Palmer Shipyard Co., Noank, Conn., for the construction of a number of coal barges to be used in the extensive Philadelphia-New England tidewater coal trade, in which the company already has a large fleet.

Helena, Mont.—The Montana Railroad Commission has ordered a reduction in rates on slack coal from the Bear Creek fields to points on the Northern Pacific R.R. The reduction to stations under 75 mi. is 10c.; between 75 and 125 mi., 15c.; between 125 and 250 mi., 20c., and to all points in Montana over 250 mi., 25c.

Indianapolis, Ind.—The Oliphant-Wasson Coal Co., which has just recently completed the equipment of a large and complete mine, announces the opening of an office in the Traction Terminal Building, at this place. The company specializes on "Old Vincennes" coal which is mined at Bruceville in Knox County.

Charleston, W. Va.—Alleging that the company is unable to operate its mines at a profit and meet outstanding obligations, W. Bernard Duke recently filed a bill in equity in the Federal Court against the Davy-Pocahontas Coal Co. He asked that a receiver be appointed. This firm operates practically entirely in McDowell County, W. Va.

Buffalo, N. Y.—The rebuilding of the lake trestle of the Delaware, Lackawanna & Western Co., now in progress by government order, to facilitate widening the mouth of Buffalo River, will make it necessary to remove the trestle about the middle of November. A car dump will be put in to replace the trestle and probably a box-car unloader.

Whitesburg, Ky.—Many coke ovens have been fired within the past few days in Wise County, Va., immediately beyond the Kentucky line. Most of these have been idle for several years. As a result thousands of new men have been added to the working force. The ovens are divided among the plants at Stonega, Osaka, Roda, Blackwood, Dorchester and Glamorgan.

St. Louis, Mo.—The Sullivan Machinery Co., of Chicago, announces the removal of its St. Louis branch sales office from 705 Olive St. to Suite 2006, Railway Exchange Bldg., where larger and more desirable quarters have been secured. This change will enable the company to give better attention to the requirements of its customers in the territory served by the St. Louis office.

Fairmont, W. Va.—The Baltimore & Ohio R.R. is preparing to place an order for 1,000 additional coal hoppers. The Western Maryland R.R. recently placed an order for 2,000 coal cars, while the Baltimore & Ohio a short time ago placed an order for 2,000 coal cars. This makes the total number of cars purchased by the two roads 5,000. Most of these cars will be used in the upper Monongahela Valley.

Fairmont, W. Va.—One of the largest industrial deals which has taken place here in many years was recently consummated when the Monongahela Valley Traction Co. took over the holdings of the Fairmont Gas Co. The capitalization of the traction company is to be increased from $7,500,000 to $12,500,000, with an authorized preferred capital stock of $3,000,000, while common stock will amount to $9,500,000.

Bristol, Tenn.—Following the general revival of the steel, iron and kindred industries, practically all of the coke ovens in southwest Virginia, many of which have been idle, have resumed operation, or will resume operation shortly. Active preparations are being made to put several furnaces and steel mills into operation, and it is expected that within the next 30 days industries in this section will be more active than at any time since 1907.

Bloomsburg, Penn.—The Supreme Court having ruled Keran Donahue off the ticket as a candidate for mine inspector because this office cannot be voted for in an odd numbered year, his attorney has now taken the position that James O'Donnell, present holder of the office, was illegally elected in 1911. The attorney has filed a petition with the court asking that the office be declared vacant, and that Mr. Donahue, who defeated Mr. O'Donnell for the nomination at the recent primary, be appointed to the office.

Jenkins, Ky.—A total of 300,000 acres of timber land in eastern Kentucky and 100,000 acres of which is the property of the Consolidation Coal Co., has been pledged to the Eastern Kentucky Forest Protective Association. This timber is in the Elkhorn and Boone's Fork sections and the first lookout station has been established in the heart of the Cumberland Mountains contiguous to the Virginia border line. It is connected by telephone with the local exchange. Other stations are projected. Twelve counties in eastern Kentucky have organized for fire protection.

Columbus, Ohio—The New Pittsburgh Coal Co., the only Hocking Valley operator that has shipped Lake coal this season to its docks, is finding the last stage of the navigation period a very lively one. Its mines are all running full time, and it has more orders from the Northwest than it will be able to take care of before boats go out of commission. Sales Manager Rundio is of the opinion that, weather permitting, the season will be greatly extended this year, because of the strong demand that has set in from the upper docks.

Coal Trade Reviews

General Review

Anthracite buying slowed up by mild weather but market has not lost ground. Heavy movement on bituminous contracts. Scarcity of vessels causes accumulations at Tidewater. Lake movement increasing. Middle Western mines on heavy working schedules.

Anthracite—The volume of coal moving has greatly increased and definite steps have been taken toward advancing quotations. The slowing up in orders occasioned by temporary mild weather have been offset by increased stocking operations among dealers who are becoming anxious over the outlook. An unusual succession of holidays in the mining regions has interfered with operations at a rather critical time. Poor car supply and slow movement on the roads continues to be the source of much anxiety. Demand at the more remote points, where shipments are difficult to obtain, is particularly strong. Full circular prices rule.

Bituminous—There is active canvassing for contracts and concessions are still obtainable for delivery before Jan. 1, but the circular is firm on business to Apr. 1. Shippers are backward about admitting any particularly heavy business, though it is obvious that most of them have more orders on hand than can be filled, while the railroads uniformly report an exceptionally heavy movement. Manufacturing interests, with storage facilities, are accumulating surpluses against possible difficulties later. Some of the better grade coals have been withdrawn from the market. The increased movement is confined largely to requisitions on contracts, and there is considerable coal arriving at the distributing centers. Restricted car supply is still interfering with mining operations.

Exports—A considerable volume of coal is accumulating at tidewater points because of the slow movement of vessels. Bunker demand continues strong and is the only active department of the off-shore business. Very few steamers are available for export trade, and these are difficult to obtain even at the unprecedented freights offered. However, foreign inquiries continue numerous, and this in spite of the fact that it is gradually developing that the British embargo against export shipments declared some months ago has been practically abandoned.

Lake Markets—While fundamental conditions are growing steadily better, iron and steel mills pushing for maximum tonnage, and cold weather now at hand, the trade is on the other hand, facing the release of the heavy production now going into the Lake markets. As a rule, the entire output is going into immediate consumption with the possible exception of some stocking on the part of the railroads, and other consumers will have to take this up shortly in order to provide against possible contingencies next April. It is becoming more obvious all the time that the transportation companies are not prepared for the heavy increased traffic and car supply continues a constant menace to the trade. Considerable negotiations are noted on contracts expiring between now and the first of the year. A large number of cars sent into the Northwest with coal earlier in the season have not been returned, which is accentuating the difficulty in this respect.

Middle Western—There is considerable pressure for coal on contracts although the mild weather has resulted in the trade being rather inactive at the moment. However, the lull in orders has given some of the agencies a welcome opportunity to catch up on their business, and there is a well-defined tendency among manufacturers to accumulate stocks of steam coal, while prices on all grades are holding steady all along the line. Mines are working on the highest operating schedules for a long time. The railroads have not fallen seriously behind on the movement so far, but it has been such a distinct effort to keep up that there is general anxiety concerning this phase of the question. Northwestern railroads are buying heavier and there is considerable coal moving to their storage plants from the upper Lake docks. Lake shipments are showing a steady increase with the approaching close of navigation.

A Year Ago—Anthracite production heavy last month but market is still dragging. Spot demand for bituminous has entirely disappeared and heavy concessions are the rule. Lake trade still further curtailed but Middle Western situation improves.

BUSINESS OPINIONS

Iron Age—Never has the steel trade seen demand so overwhelming as at present, and, at the same time, output expanding on such a scale, under steadily advancing prices. The tide has risen rapidly this week with increasing signs of excitement. In pig-iron history October goes down as the month in which the country's yield first reached 3,000,000 tons, and the daily output crossed the 100,000-ton mark. When war order tonnages of six figures are bandied about so commonly it is hard to believe that the year opened with a daily pig-iron production of only 51,000 tons, or half what it is now.

American Wool and Cotton Reporter—With sales of 10,750,000 bales of wool during the week under review the wool market has been considerably more active. It is said that a more general business for all kinds of wool has never been seen before. The market has been particularly active in territories, Capes, and Australians. Large trades are pending. Besides the business of the big mills about every little woolen mill in the country is running full time. It is predicted that even after the war ceases there will be nothing to warrant a decrease in values or business for some time to come. Some mills, which have been relying upon foreign business in order to keep in operation, are now running on domestic orders.

Boston News Bureau—General trade is increasing in volume and commercial interests are busy and confident. The election is bound to have a stimulating effect in financial circles. There is no doubt but that the renewed vitality of the Republican party is a favorable feature, because it indicates a coming return of the party to power which means a change in tariff by the time the European war comes to an end. A favorable factor is that railroad earnings are beginning to show substantial gains. Crops are not only moving but we are commencing to feel the benefits from the transportation of war materials.

Bradstreet—The trade and industrial stream is running fuller and in some cases is out of its banks. Warm weather is a drawback temporarily to retail trade the country over, but helps the drying of corn and the threshing of wheat, now much delayed. Jobbing trade is more active, and industry shows a still speedier pace, with some hitherto lagging lines, such as lumber, especially at the south, naval stores, coal, jewelry and shoe manufacturing, making better progress.

The Southern Lumberman—Optimism still reigns supreme in the yellow pine market. Price advances which have been repeatedly made during the past month and which have ranged in the aggregate from $1 to $2.50 on practically all items during that time are not only being maintained, but are expected to reach still greater heights in the immediate future. The hardwood market is maintaining its steady progress, and reports indicate that buying is decidedly more active, and that the sources of demand are more diversified.

Marshall Field & Co.—Current wholesale distribution of dry goods shows a healthy increase over the corresponding period of a year ago in spite of the warm weather which has tended to restrict demands upon the retailer. Road sales for both immediate and spring delivery are running ahead of the past two years, and merchants continue to come into market in much larger numbers. Collections are well ahead of a year ago.

Dun—Not only is there no step backward in general business, but each week the pendulum of progress swings over a wider area and confidence is further strengthened. Recent vagaries of the weather have not been conducive to the best results in retail distribution, yet substantial gains are nevertheless apparent in this direction. The forward movement gathers momentum in spite of various opposing influences, such as the unstability of foreign exchange, the congestion of freight at terminal points and continued dissension in the ranks of labor, and, while expansion is still most pronounced in war order lines, on the whole, conditions and prospects are much less checkered and irregular than formerly.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River fairly steady, with no price developments. Georges Creek easy, but inquiry continues active for the Pennsylvania grades. Water freights firm. Anthracite trade active.

Bituminous—There is no material change in the situation of Pocahontas and New River. While there is a large volume of coal standing at the Hampton Roads piers, it is attributed more to the slow movement of vessels the past fortnight than to dullness of trade. It is on contracts, however, that by far the largest tonnage of these coals is moving, both spot and export inquiry being very light. Concessions are still being made on small tonnages for delivery before Jan. 1, but most of the agencies are adhering closely to the $2.85 basis for deliveries through to Apr. 1. The fact that the Pennsylvania grades are on the upward trend is bound to be reflected in the Hampton Roads situation sooner or later.

The various distributors inland from Boston, Portsmouth, etc., continue their active canvassing for contracts the next coal year. Prices on cars Mystic Wharf, Boston, are still freely quoted at $3.50 for such contracts, but the response from buyers so far has not been especially encouraging.

Georges Creek tonnage is being affected somewhat by the slack demand for export. Shipments to New England are coming forward regularly, although it is expected that car supply will begin to curtail the volume of this grade available for Tidewater.

The market on the choicer grades from Pennsylvania continues fairly active. No advance can be reported over quotations of a week ago, but on the part of shippers there is the same indisposition to quote for extended delivery.

All-rail trade is in good shape, a favorable movement on contract being especially noticeable. It becomes increasingly evident that plants with ample storage are accumulating coal in anticipation of difficulties later on.

Water freights are steady at 80@85c., Hampton Roads to Boston, on boats of 2,500 tons upward. Rates from New York to Providence are a trifle easier, 50c. rather than 55c. being the current quotation, the mild weather being a factor.

Anthracite—The demand is seasonable in all directions. What the weather lacks is more than made up by the desire of most dealers to keep on hand as large stocks as possible. The shippers are still able to fill orders without much delay. The recent ruling by the Pennsylvania Supreme Court unfavorable to the Pennsylvania state tax is a subject of great interest in this market.

Bituminous quotations, f.o.b. loading ports at points designated, are about as follows, per gross ton:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields..............	$2.25@2.75	$2.55@3.00	....	$0.95@1.50
Cambrias and Somersets.	2.45@2.95	2.70@3.20	....	1.20@1.65
Georges Creek..........	2.92@3.02	3.22@3.32	$2.85@2.95	1.67@1.77

Pocahontas and New River prices, on cars Boston, are $3.50@3.73; Providence, $3.50@3.68; and f.o.b. loading port at Hampton Roads, $2.80@2.85.

NEW YORK

Anthracite demand heavy, but car supply short. Independents getting full company circular. Holidays interfere with mining. Demand for bituminous coal active and contract prices advanced. Lack of vessels interrupts export business.

Anthracite—The hard-coal market continues its activity, notwithstanding some mild weather. Buyers seldom have an opportunity of picking up a cargo of prepared coals at less than the full company circular and then only when the shipper happens to be long on that particular size. Mine operations have been interfered with by three holidays. On other days the mines worked full time unless prevented by the lack of cars. Transportation troubles curtail shipments and they promise to become greater. Already some shippers are becoming anxious and are advising their customers to take advantage of the present situation and stock up. Early this week shortages of egg, stove and chestnut were heard of.

Tidewater demand is no heavier than a week ago, but from New England points the call is heavier and prices stronger than in the Metropolitan district. Heavy demand also comes from the provinces, where the dealers are stocking up to guard against storms and transportation tie-ups. Shipments to Lake points are large and the line trade is taking its full quota.

Of the prepared coals stove is the shortest. Egg and chestnut are easier. Steam sizes are tightening and there is no accumulation. No. 1 Buckwheat is scarce and commanding the full circular. The better grades of Nos. 2 and 3 are out of the market.

Quotations, f.o.b. New York tidewater gross tons are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken................	$5.05		$5.10	
Egg....................	5.30	$5.20@5.30	5.35	$5.25@5.35
Stove..................	5.30	5.20@5.30	5.35	5.25@5.35
Chestnut	5.55	5.50@5.55	5.60	5.55@5.60
Pea....................	3.50	3.25@3.50	3.55	3.50@3.55
Buckwheat............	2.75	2.25@2.75	2.80	2.25@2.80
Rice...................	2.25	1.85@2.25	2.30	2.00@2.30
Barley.................	1.75	1.50@1.75	1.80	1.75@1.80

Bituminous—Demand for soft coal continues strong. While there is more coal at Tidewater than a week ago, prices remain firm and there has been no letting up. Owing to the activity in the local market some operators are sending all surplus coals eastward which may result in the overstocking of the local docks unless colder weather sets in or buyers stock up. Cars continue scarce and no improvement is in sight. In the majority of districts operations are curtailed. No operator seems to be getting his full quota of cars.

Contract movement remains active, while there is little of the better grades in the spot market. Efforts of large consumers to renew expiring contracts at old prices have met with failure, the agencies holding at close to existing market figures. In most instances the advanced prices were accepted.

Demand from the New England states is heavy and there is considerable coal being sent there at higher than Tidewater prices. Slack advanced another five cents during the week, making the mine price at from 95c. to $1. Lack of vessels continue to hamper the export trade, but the call remains active. Bunker demand is strong.

Current quotations, gross tons, f.o.b. New York harbor, are about as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein.	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85
Georges Creek Tyson....	2.95@3.00	2.95@3.00	2.95@3.00	1.40@1.45

Steam..........................		2.70@2.80	2.70@2.80	1.15@1.25
Western Maryland..............		2.70@2.80	2.70@2.80	1.15@1.25

PHILADELPHIA

Anthracite now going strong, with big October tonnage. Pea advanced 25c. Stove strong and chestnut improving. Egg still slow, with pea heavily sold. Buckwheat active, but rice dull. Collections in good shape. Healthful tone to bituminous, with general price increases.

Anthracite.—The trade is now in its stride, with good business reported from all quarters. The advance by the big companies of 25c. per ton on pea coal, bringing the selling price up to $2.25 per gross ton, was one of the leading developments of the week. The action came as a surprise and though apparently an important step, it is really only a move to make it possible to get the advanced price by the first of the year. It is certain that very little coal will be sold at the new price before that time, as buyers are generally protected on the $2 price until Jan. 1. However, it is sure to stimulate buying, as there is no doubt that the new price will eventually be effective. The individuals now expect to have an opportunity to recoup for the sacrifices they made on this size in the spring and summer; they will get practically all of the business of the small dealers, who only buy as they actually need supplies.

The tonnage of the other sizes has increased greatly. Broken is easy; since the price of coke has gone up a number of companies report inquiries for this size from gas companies. With all collieries working to the full production, egg continues difficult to move and sales were made at $3.50 at the mines, without the tax. Stove seems well able to hold its own, and chestnut has improved to such an extent that the better grades have very little difficulty in getting full circular.

Buckwheat remains in constant demand and there are only a few of the harder grades in this size that show any tendency to drag. Considerable of this grade is going into private storage, as is also rice.

An effort was made by the Philadelphia Coal Exchange this week to bring an end to the retail price war, but at a "good fellowship" meeting engineered by the organization the price cutters refused to get together and some of the leaders even declared in strong language they were watching their competitors' every move with the express intention of not allowing themselves to be undersold and if necessary would go even lower. At this time they are taking extremely small profits on their best seller, pea coal, by delivering it at $4.50 where it is costing them $3.45 plus their expensive advertising. As to the larger sizes, they are receiving 50c. per ton less than they did this time last year.

The circular prices per gross ton at the mines and for tide shipments f.o.b. Port Richmond are as follows:

	Line	Tide		Line	Tide
Broken............	$3.50	$4.75	Pea...............	$2.50	$3.25
Egg...............	3.75	5.00	Buckwheat.........	1.25	2.25
Stove.............	4.00	5.00	Rice..............	.85	1.75
Chestnut..........	4.15	5.25	Barley............	.50	1.50

Bituminous.—Shippers are slow to admit that there is a particularly heavy trade, yet the fact remains that everyone has more orders than can be filled and the railroads report an exceptionally large tonnage moving. Of course the unfilled orders are due to the short car supply.

The export trade continues quiet and it is gradually developing that the embargo of the British Government against the export of native coal some months ago did not remain in effect more than a month. Although no public notice has been made of its removal, it is known for a fact that large shipments of coal are being made from the British Isles not only to the allied nations, but to neutral countries, particularly those of South America. Inasmuch as there is an extraordinary demand for vessels to carry the exceptional general tonnage offering, rates for coal remain very high.

The price per gross ton at the mines on the various grades of coal during the past week averaged about as follows:

Georges Creek Big Vein..	$1.70@1.80	Fairmont gas, ¾.........	$1.35@1.45
South Fork Miller Vein..	1.55@1.65	Fairmont gas, mine-run..	1.20@1.25
Clearfield (ordinary).....	1.20@1.30	Fairmont gas, slack......	.90@1.00
Somerset (ordinary).....	1.20@1.25	Fairmont lump, ordinary.	1.15@1.20
West Va. Freeport.......	1.05@1.15	Fairmont mine-run......	1.00@1.10
		Fairmont slack..........	.90@1.00

BALTIMORE

Car supply remains the dominating feature of the market. Demand growing stronger and the price list for' all available coal is tightening. Exports restricted.

The dominant feature of the coal trade situation is the car supply. Orders are fairly plentiful but producers and shippers are pulling out of the open market. Certain coals, for the most part of the better grade, are entirely out now.

The price list is naturally tightening under such conditions. If there were more coal on the market to offer it would probably go up faster as it is the best grades that have been withdrawn that are so urgently needed now. Slack went up with a bound the past week, advancing from 15 to 20c. and the market being restricted and strong at $1 in most cases.

Prices to the trade may be quoted about as follows where there is any free coal to offer:

	Mines	Balt.*	Fairmont	Mines	Balt.*
Geo. Crk. Big Vein	$1.80	$2.98	Ordinary mine run	$0.95	$2.33
Geo. Crk. Tyson...	1.50	2.68	Ordinary ¾.	1.00@1.10	2.43@2.53
Clearfield.... . .	1.30	2.48	Ordinary slack....	1.00	2.43
South Fork........	1.50	2.68	Low sulphur mine-run............	1.20	2.63
Latrobe....	1.10	2.18	Low sulphur ¾....	1.30	2 73
Somerset (best) ..	1.45	2.63	Low sulphur slack.	1.00	2 43
Somerset (good)...	1.25	2.43			
Quemahoning.... .	1.35	2.53			
Freeport..........	1.10	2.18			
Miller Vein.......	1.30	2.38			

* F. o. b., outside Capes.

HAMPTON ROADS

Movement both coastwise and foreign somewhat slow. Excess accumulations. Concessions made on the circular.

The movement of coal from Virginia tidewater for both foreign and coastwise consumption has been somewhat slow during the week. The demand for spot and contract business has been light and the indications are that the coming week will see little if any improvement. Coastwise shipments have practically all gone to New England with the exception of some small cargoes to one or two of the near ports South. Three cargoes for Gibraltar for orders are intended for one or more of the Italian ports, final destination being given at Gibraltar.

The accumulation of coal at the various piers is still in excess of normal. Circular prices are being quoted but indications are that these would be shaded somewhat for prompt movement. As has been the case for some time buyers from both European and South American ports are asking for c.i.f. prices which is difficult for shippers here to quote. The tonnage of bunker coal is still somewhat small as compared to normal conditions.

Achlibster	Italy	2,820	15 60

OCEAN FREIGHTS

The steamer "Achlibster," about 7,000 tons coal capacity, is reported as having been chartered to load coals for the West Coast of Italy at or about $15.60, November loading, and three large sailing vessels have been chartered, one for West Coast of Italy, one for Barcelona, and the other for Lisbon, at or about $10 per ton, these freights paid in advance without discount, and charters paying foreign port charges and stevedore bills. $16.80 per ton has been paid on grain for the West Coast of Italy. Notwithstanding the high rates current on grain from the Plate outward coal freights to the Plate continue to advance.

The freight market is quotable about as follows:

W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Favorable and unfavorable influences balance. Operations at 70 to 75% of capacity, with many car shortages. Domestic demand light for the season of year.

The coal market is holding its own comfortably. Fundamental conditions as to consumption have been growing better, with cold weather approaching, iron and steel mills pushing for maximum tonnage outputs and railroads consuming more coal as well as stocking some, but there hangs over the situation the fact that Lake shipments will soon be over, releasing much mining capacity as well as furnishing more cars, and this just about balances the favorable influences.

Cars having been growing scarcer week by week and on many divisions shortages are now the rule, many mines operating fewer days than they would like. Here and there labor is less plentiful than would be desired, but there is no important shortage, at least thus far. Mine operations average 70 to 75% in the Pittsburgh district.

Domestic coal movement is very slow, the weather up to date having been unseasonably warm.

Prices have advanced slightly, the prompt market being quotable as follows: Slack, 70@75c.; nut and slack,, 90c.@$1; nut, $1@1.10; mine-run, $1.15@1.25; ¾-in., $1.25@1.35; 1¼-in., $1.35@1.45. Contract to Apr. 1: Slack, 85@95c.; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

BUFFALO

Bituminous doing well with slack higher. All reports from the Pittsburgh district are bullish but the situation is not so strong here. Anthracite suffers from the mild weather. Orders canceled.

Bituminous—The movement is good and is increasing all the time. Practically all of the coal moving is going into immediate consumption. The railroads are stocking some, but the private consumer has only ordinary supplies on hand. It is the general belief that business in other lines besides iron and steel will be strong for the winter at least. If that is true the bituminous consumer must have a good surplus sometime during the winter and he may find it a problem to get it unless he begins to stock up soon. In fact it is probable that he has waited too long already as there are by no means cars enough to meet the demand as it is. Yet private consumers have been able to get all the coal they want at bottom prices.

The price of slack has advanced since last week, but sizes remain the same, with three-quarter not so strong as the average. Quotations are:

	Pittsburgh	Allegheny Valley	Penn Smokeless
Lump	$2.80	$2.65	$2.55
Three-quarter	2.65	2.55	.....
Mine run	2.55	2.35	2.30
Slack	2.25	2.20	2.30

These quotations are for Buffalo and eastward to Rochester on a short-ton basis. East of Rochester all bituminous is sold on a long-ton basis.

Anthracite — The trade is still suffering from the mild weather. There are some reports of orders being canceled on account of this, which is an unusual condition for this time of the year. It is likely that the consumption for the year is not going to be up to the average. The westward rail movement is not as heavy as it should be now though there is considerable moving by Lake. This is done to avoid stocking at this end. While Lake shipments are good, there is a scarcity of tonnage and vessels are often taken that are too small to handle easily at certain docks. Lake shipments for the week were heavy, amounting to 143,000 tons.

The wholesale prices of anthracite per long ton are: $5.60 for grate, $5.85 for egg and stove, $6.10 for chestnut, $4.30 for pea, $3.25 for buckwheat, $2.75 for rice, $2.50 for barley and $2.25 (not circularized) for screenings, f.o.b., with 25c. additional for delivering on board vessel.

COLUMBUS

Steam market very strong. Domestic demand slows up. Lake trade increasing with approaching close of navigation.

Business in steam coal is the best in a year and a half and prospects for the future are bright. In fact manufacturing is expanding so rapidly that some producers and shippers have difficulty in keeping up with orders. The tone of the trade is satisfactory in every way and many coal men are predicting a runaway market about the holidays.

In iron and steel circles the demand for tonnage is growing every day. But the demand is not confined to that line by any means and other lines of manufacturing are also prospering. Contracting is more active as quite a few expire from this time until the first of the year. In domestic lines there is a slight lull, due to the continued warm weather, Retailers are holding up shipments that were ordered some time ago but comparatively few cancellations have been reported. Retail prices are firm all along the line.

The Lake trade is rushing as the season draws to a close. Reports from the Northwest show that the congestion on the docks is passing away and there will be a rush from now until the closing of navigation. Chartering of boats is difficult. The Hocking Valley docks at Toledo handled more than 65,000 tons during the week ending Oct. 29 and the total tonnage handled by the docks since the opening of navigation is 2,251,000.

There is an increasing demand for anthracite in central Ohio territory and prices are ruling firm. Coke is also in good demand and many predict a scarcity within a very short time.

Prices in Ohio fields are as follows per short tons, f.o.b. mines:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.60	$1.65	.....	.....
Inch and a quarter	1.50	1.50	$1.35	$1.50
Three-quarter-inch	1.35	1.40	.....	1.35
Nut	1.25	1.30	.....	1.25
Mine-run	1.15	1.20	1.05	1.10
Nut, pea and slack	.70	.75	.65	.60
Coarse slack	.60	.65	.55	.50

Mines have been working at about the following percentages of full capacity:

District	Week Ended Oct. 9	Oct. 16	Oct. 23	Oct. 30
Hocking	50	55	60	65
Jackson	30	40	60	50
Pomeroy	65	85	65	90
Crooksville	45	50	85	65

District	Week Ended Oct. 9	Oct. 16	Oct. 23	Oct. 30
Cambridge	50	60	60	65
Massillon	55	60	45	70
Eastern O.	80	85	85	80
Average	55	62	65	69

TOLEDO

Domestic quiet due to mild weather. Steam grades active. Car supply short.

The domestic trade is quiet owing to the mild weather but there is an excellent tone to the market. A decided shortage of cars is reported. Mines on the C. & O. are not averaging over three days a week; the L. & N. is easier than most of the roads but the supply is tightening on this line also. The Pennsylvania is having difficulty in securing sufficient gondola cars due largely to the great activity in the steel industry.

Steam coal is in good demand and Pocahontas mine-run is steady at $1.40. Some of the larger companies claim to be entirely sold up on Pocahontas and there does not seem to be any surplus in the mine-run sizes. There is neither a shortage nor a surplus in the prepared sizes. Kentucky operators are reported in good shape and are getting higher prices for their product than for several years. West Virginia coal is stronger than a month ago. Mine-run is selling at 90c. and $1. Domestic 4-in. lump which a few weeks ago was bringing $1.25@1.50 is now selling at $1.50@1.75.

CINCINNATI

In spite of warm weather and small demand, the short car supply has resulted in a scarcity of fuel. No prospects for improvement in sight.

The car shortage is now the one big factor in the coal market. In some cases no cars at all were obtainable the latter part of the week, although conditions showed some improvement earlier. The betterment was short-lived, however, giving way to even a greater scarcity. Failure to return cars from the Northwestern territory seems to be the principal difficulty just now, although it is also true that immense traffic requirements have found the railroads unprepared.

DETROIT

Steam coal trade is less active. Warm weather continues to check domestic business and delay anthracite distribution. Lake trade is light.

Bituminous—Inquiries and orders for steam coal have become less urgent. It is not a serious lapse, but rather a sort of easing off, which is not expected to continue long, or largely reduce the volume of sales. Weather conditions continue unfavorable to steady expansion in the trade. Orders are straggling and for small amounts, while retail yards seem well supplied with stock.

Speculative shipments are greatly diminished and are not a disturbing factor in prices. Fine coal is sold readily, though lump and egg is less easily moved and at intervals is sold below schedule.

Anthracite—Deliveries of anthracite are delayed by warm weather. Retail yards are liberally supplied and little business is going to the shippers. Shortage of cars in the producing districts is causing some delays which are expected to increase later in the season.

Lake Trade—With iron ore shippers increasing season schedules, and high carrying rates in the grain trade, vessel owners are striving to increase dispatch on downbound freight. The coal movement is now restricted almost entirely to contract vessels, except in the case of small cargoes to ports not on regular routes.

LOUISVILLE

Trade continues to expand but prices are still under some pressure due to mild weather.

The past week has brought a good increase in activity and given considerable buoyancy to the Kentucky coal market. Mild weather is holding up any advance in prices on domestic sizes, although the trade will endeavor to put another ten cents on for November. Steam coals are better and numerous inquiries, together with prospective big purchases, are productive of optimism. Car shortages are still curtailing operations.

Eastern Kentucky coals have sold, f.o.b. mines, long ton basis, from $1.75 to $2.10 for the block and $1.25 to $1.50 for egg. In western Kentucky, lump coal is selling above and below $1.25. Some improvement has been noted in the steam coal situation due in a large part to the fact that the Illinois Central has been taking run-of-mine coal instead of mixed as heretofore.

BIRMINGHAM

Coal business still improving, particularly on lump coal. Car supply outlook acute.

A substantial improvement is being felt, both on steam and lump but, especially on the latter, and a few cool days will give the operators about all they can do to fill orders. The tonnage being moved on steam coal is larger than for some time, and the prospects are good for a steady improvement, though the car supply is giving some trouble, and the operators will be seriously handicapped within thirty days unless conditions improve in this line.

COKE

CONNELLSVILLE

Spot furnace coke high. Foundry coke advanced. Production and shipments at new record rate for the year.

There have been a number of sales of strictly spot furnace coke in the past ten days at $2.75, but there has usually been some coke that could be picked up at around $2.60, the top price usually being paid only when the seller could give car numbers. Not much has been done by way of contracting for next year, the bulk of the expiring contracts having already been taken care of. The Youngstown Sheet & Tube Co. will have occasion to buy for its four furnaces, requiring about 18,000 tons per stack per month, but only for about four months of the year, as the company's byproduct ovens are expected to be completed about May 1.

Foundry coke has been advancing rather sharply. Several sales of carloads for prompt shipment have been made at $3, and in one instance at $3 to a dealer, this not including the 15c. brokerage the dealer is supposed to make. The amount of coke available at less than $3 seems to be limited, though there is some. Operators making a specialty of high-grade foundry coke are disposed to ask sharp advances on contracts for the first half of next year, and one leading operator has already fixed a minimum of $3.25. Last May and June there was much relatively cheap foundry coke offered, by producers who did not cater particularly to the foundry trade, and such operators are much less disposed to figure in the foundry coke market at present, when furnace coke is in such demand. There will probably be a fair amount of contract business come up in foundry coke, as when contracts were made last May and June most of the operators made more or less of an attempt to induce buyers to be content with six month contracts, to Jan. 1. We quote: Prompt furnace, $2.60@2.75; contract furnace,$2.25@2.50; prompt foundry, $2.90@3; contract foundry, $2.90@3.25, per net ton at ovens.

The "Courier" report production in the Connellsville and lower Connellsville region in the week ended Oct. 23 at 428,319 tons, an increase of 7,228 tons, and shipments at 437,548 tons, an increase of 14,903 tons.

Buffalo—This market is unable to keep pace with the feverish state of the coke market, as reported from the ovens. Some of them quote prices that could be obtained here and some refuse to quote at all. Advances are reported day by day. It is true that the extreme scarcity of cars is the reason for much of this. Buffalo quotes best foundry at $4.85 and stock at $3.75.

Chicago—Foundry coke shows advancing tendencies, and byproduct sizes are strong at higher prices. Connellsville is up to $5.50, and quotations at this price are only made for immediate acceptance. Some coke shippers are asking fictitious prices to prevent placing of orders. Prices per net ton f.o.b. cars Chicago are as follows: Byproduct foundry, $5.25 to 5.50; byproduct domestic, $5.25; Connellsville, $5.50; Wise County, $5 to 5.25; gas coke, $4 to 4.25.

Birmingham—On account of the large number of blast furnaces operating in this district, the coke market is stronger than it has been for two years, several large contracts having been closed recently on furnace coke at satisfactory prices to the manufacturers, shipments to extend over the next twelve months. Foundry coke shows some improvement also.

MIDDLE WESTERN

GENERAL REVIEW

Warm weather prevails all week. Domestic demand easier. Screenings maintain their strength. Prices firmly held.

Demand has not undergone any expansion since last report because of the mild weather. The retail trade is quiet in the city, but some country dealers have taken cognizance of the deficiency in railroad equipment and commenced to put in reserve stocks. Demand for steam sizes is more active and screenings if anything are stronger. Prices on all grades are holding steady at schedules. Far-sighted manufacturing interests are showing some inclination to accumulate stocks but many industries not having facilities for storage are obliged to buy on a hand-to-mouth basis and will undoubtedly pay the penalty later. Consignment coal on tracks is practically nil.

If the warm weather continues another week, some operators will curtail output rather than reduce prices. Heavy production has not had any evil effects as yet, because reserve stocks are small. Considerable pressure is still exerted on some shippers for contract deliveries, and more than the usual amount of contract coal has been moving at this time. Many shippers had a considerable accumulation of orders on their books which they have been filling during the past week because of the lull in demand. Farmers are taking advantage of the fine weather to move their crops to market, and country dealers report increased buying in this trade.

CHICAGO

Milder weather brings out some concessions, but market generally well maintained. Shippers catching up on delayed deliveries. .Steam continues active, manufacturing concerns showing more interest.

Slight concessions have been made by some of the Franklin County operators to move the coarser sizes, because of a lull in demand and extraordinary heavy production. Screenings are selling higher, and in the last two days have averaged 60c. Egg is lagging, and No. 1 nut is falling behind. It is very likely output will be curtailed to meet the market situation if warm weather continues. Large piles of fine coal are now being dumped on the ground at Franklin County mines. Williamson County coals are in good demand with prices unchanged. Saline County screenings show greater strength.

Springfield mines have about covered all unfilled orders for domestic sizes. Screenings are a trifle softer, the prevailing price being approximately 45c.

The demand for Indiana steam coal is more urgent, due to inadequate car supply; the larger mines have been losing an average of one day weekly through this cause. Orders for domestic sizes have eased off somewhat, owing to moderating weather. The price position of all Indiana coals except egg and nut is strong, and colder weather will see marked advances.

While production of West Virginia coals is reported to be reaching unprecedented proportions, the demand continues to grow for both domestic and steam sizes, and many contracts are now being completed. The Western demand is not quite as brisk, but there is about enough coal coming into the market to meet requirements. Splint lump has been reaching the high level of $1.90 during the last week. Pennsylvania smokeless is bringing about the same price as the West Virginia product, and owing to car shortages the minimum tonnage is reaching this market.

The Hocking market is strong, and recent advances in the circular have been well maintained. Increased buying of steam sizes is a prominent feature while the domestic trade is brisk. The better grades of Hocking lump are now touching $1.75, and mine run is not sold below $1.15, many orders being filled at $1.25. Screenings are strong.

Kentucky coals are now well sold up on every size, and car and labor shortages are curtailing production. Block commands from $1.75 to $2.25, and shipments of the coarse sizes are rapidly falling behind orders.

Anthracite orders have receded in conformity with weather conditions. October prices are being quoted in Chicago for November shipments. Current orders are being filled with little delay.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.
Lump	$1.65@1.75	$1.60@1.75	$1.50@1.60	$1.35@1.50	$1.40@1.60

Kanawha 3-in. splint, $1.50@1.90.

ST. LOUIS

Domestic grades weak due to mild weather. Delayed orders well cleaned up and operations less active.

Warmer weather has made the market weaker on the large sizes. Prices are steady in the main, but some sales were made below quotations. All back orders have been cleaned up and fewer mines are in operation than last week. Screenings, under the reduced output, have strengthened 5 to 10c. In spite of balmy weather general conditions are better than this time last year and there is less price demoralization, due to exchange of information which prevents over-production.

Quotations f.o.b. mines ranged on the following basis per short ton.

	Frnk. Co.	Wlmson. Co.	Staunton	Standard
6 in. lump	$1.50@1.75	$1.50@1.75	$1.25@1.50	$1.15@1.25
8-in. lump	....	....	....	1.25

Screenings	.55@.60	.55@.60	.30@.35	.30@.35

Freight rates: From inner group, St. Louis 57½c., East St. Louis, 37½c. Outer group, St. Louis, 72½c., East St. Louis 52½c.

INDIANAPOLIS

Weather unfavorable for domestic grades, but steam coal trade gaining in volume. Increase in mine operations. Prices hold firm.

At the present rate of improvement, it is expected that full running schedules will be in effect before this month expires. October weather was mild and this cut down the demand for domestic grades perceptibly. Steam grades continue to move well to railroads and manufacturing plants and further improvement is expected in this department. The transportation companies have been able to keep enough cars at the mines, but it seems to be some effort to do it and this probably presages trouble later on.

Screenings sell for 50 to 65c., according to destination, as well as conditions of sale and shipment. No. 4 screenings have not fallen below 80c., f.o.b. mine. Most contracts for domestic grades have been filled and consumers are ready for cold weather. Retail prices, like mine prices, are unchanged from the level recently prevailing.

DULUTH

Docks continue active, although lacking the stimulus of cold weather. Receipts show no change. Prices are firm.

Shipments continue at the recent high level and the market is strong. No announcements as to any changes in prices have yet been made but coal men generally anticipate an advance in the very near future. The retail trade is taking a fair volume although the mild weather has curtailed business in this direction to some extent. Larger purchases by the railroads are noted and a fair tonnage has moved to their storage points in the Northwest. Receipts show no material changes, but it is believed that from now to the close of navigation receipts will be larger. Quotations per short, ton f.o.b. cars, docks, at Duluth are as follows:

	Yough	Splint	Hock	Smokeless	Elkhorn
Lump	$3.40	$3.40	$3.40	$4.75	$3.75
Dock run	3.10	3.10	3.05	3.25	3.25
Stove or nut	3.40	3.40	3.40	4.75	3.65
Screenings	2.40	2.40	2.25	2.75	2.40

No great activity is noted in the anthracite trade, but the volume of business is well maintained despite the mild weather that has prevailed throughout the entire Northwest for the past ten days. Quotations are as follows: Egg and stove, $6.85; nut, $7.10; pea, $5.55 and buckwheat, $4, all f.o.b. cars, per short ton, at Duluth.

KANSAS CITY

There is a stronger demand for domestic coal and an increase of 5c. in the price of mine-run. The dealers take orders subject to delay and cannot promise shipment within two weeks. It is impossible to get any semianthracite and the larger companies are refusing orders for that coal at $3. The demand from the steam users has fallen off slightly. The outlook is particularly promising.

PORTLAND, ORE.

Mild weather delays heavy business in coal for domestic purposes and trade is only moderately active.

Mild weather continues here and the demand is light so far this fall. Dealers do not look for any heavy movement until there is a decided change in the weather. There has been no change in prices here for several weeks and none is likely. So far there is no indication of any coal being brought here from Australia the coming winter, although several cargoes are reported on the way to San Francisco.

FOREIGN MARKETS

GREAT BRITAIN

Exports—British exports for September and the first nine months of the past three years were as follows:

I. C. C. DECISION

Investigation and Suspension Docket No. 661—Allowances on anthracite coal at Hauto and Nesquehoning, Penn.

The Central Railroad Co. of New Jersey proposed by the tariffs under suspension to pay to the Lehigh Coal and Navigation Company certain lateral allowances out of the rates on shipments of anthracite coal from Hauto and Nesquehoning, Penn.; Held, That the allowances would effect unlawful discrimination and constitute unlawful rebates. Tariffs ordered canceled.

I. C. C. No. 6821—David Rutter & Co., vs. Chicago and North Western Railway Co., Et. Al.

Upon complaint that defendants have been and are assessing unlawful, unreasonable, and discriminatory charges on carload shipments of coal from eastern mines to complainant's yard at Evanston, Ill., Held:

1. In the absence of joint rates or a specific manner of constructing through rates the lowest combinations via the routes of movement are the lawful rates.

2. The lawful through rates from eastern mines to Evanston were and are the rates to Greenwood street station, plus the local distance rate of the Chicago & North Western to Evanston and a reconsigning charge under the conditions named in the tariff, except that where rates to Greenwood street station are limited by tariff to shipments unloaded there the combination is made on Chicago instead of on Greenwood street station.

3. The allegation of unjust discrimination is not sustained by the record.

4. The traffic here involved is through traffic and the reasonableness of the rates applicable thereto must be considered from the standpoint of the through rates in their entirety. So considered, the evidence does not show that they are unreasonable.

5. Defendants directed to refund all overcharges to complainant, with interest.

I. C. C. No. 6849—Atlas Coal and Coke Co. vs. Pennsylvania R.R. Co., Et Al.

Charges collected for the transportation of a carload of coal from Viola Colliery No. 1, Penn., to Calvert yard, Baltimore, Md., reconsigned to Canton Diers, Baltimore, Md., not found to have been unreasonable. Complaint dismissed.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

+Indicates contracts regarding which official information has been received.

New Business

+1611—Williston, N. D.—The County Government will receive bids until 9 a.m., Nov. 22, for furnishing coal as may be required at the Court House and Jail during the ensuing year. All bids must be accompanied by a certified check for $50. Address County Audr. M. H. Aaen, Williston, N. D.

+1612—Aliquippa, Penn.—The Village Government received bids until 7 p.m., Nov. 1, for furnishing approximately 500 bu. of 1¼-in. lump coal to be delivered at the Municipal Building. Address Secy. L. S. Patton, Aliquippa, Penn.

+1613—Knoxville, Tenn.—The City Government will receive bids until noon Nov. 8, for furnishing coal and coke as may be required during the coming fiscal year. Bids must be submitted according to specifications on file at the Recorders Office. Address Recorder R. P. Williams, Knoxville, Tenn.

+1614—Hackettstown, N. J.—The Building Committee of the Board of Education received bids until 8:30 p.m., Oct. 28, for furnishing approximately 150 tons of Scranton pea coal to be delivered as required at the Public School Building. Address Wallace Taylor, Bldg., Com., Bd. of Edu., Hackettstown, N. J.

1615—Philadelphia, Penn.—S. B. & B. W. Fleisher, Inc., consume approximately 2,550 tons of buckwheat coal per annum, for which they usually contract some time in December. Deliveries are made by railroad, at the rate of 50 tons per week and the company has storage capacity for 300 tons. Address, Pur. Agt. A. A. Fleisher, Main and Rector St., Philadelphia, Penn.

+1616—Houston, Tex.—The Harris County Government will receive bids until 10 a.m., Nov. 10, for furnishing the Harris County Boys School at South Houston and the Harris County School for Girls at Bellaire with coal as may be required during the coming season. Address County Audr. H. L. Washburn, Houston, Tex.

+1617—Brooklyn, N. Y.—Bids will be received by the Borough of Brooklyn until 11 a.m., Nov. 11, for furnishing and delivering aproximately 3,300,000 lb. of anthracite coal to the various public buildings, courts and baths, delivery to be completed by the end of the current year. The bids will be awarded in a lump sum, and deliveries will be as required. Blank forms and complete details may be had on application. For data covering the previous award on this contract, see Vol. 6, p. 1009, Vol. 7, p. 108. Address, Pres. L. H. Pounds, Bureau Public Bldgs. and Offices, Room 1003, 50 Court St., for further information and address bids to L. H. Pounds, Room 2, Borough Hall, Brooklyn, N. Y.

1618—St. Louis, Mo.—St. Louis Dressed Beef and Provision Co. is receiving bids for furnishing 600 tons of screenings per week. Address, Pur. Agt. J. M. Weiser, 3919 Papin St., St. Louis, Mo.

1619—Pleasantville, N. J.—The Atlantic County Board of Freeholders received bids until 11 a.m., Nov. 4, for furnishing 200 tons of Lehigh Valley pea and 150 tons stove coal. Deliveries are to be made at Dolphin Sta. on the P. R.R., as required. The coal is for use at the Asylum and Almshouse. Address, Supt. T. L. McConnell, Pleasantville, N. J.

1620—Missoula, Mont.—The Missoula Light and Water Co., contract some time in December for their annual requirements of coal, involving approximately 9,000 tons slack and nut. Deliveries are made by railroad at the rate of from 300 to 1500 tons a month, and the company has storage capacity for 600 tons. Coal from the Roundup mines is supplying the present contract. Address, Pur. Agt. C. H. Christensen, Missoula Light and Water Co., Missoula, Mont.

1621—Columbus, Ohio—The Ruggery Building is in the market for approximately 300 tons of nut, pea and slack or coarse slack coal. Deliveries are to be at the rate of 50 tons per month during the winter months. Bids will be received on either Hocking Valley of West Virginia coal. For previous announcement of the old contract see contract 1, Vol. 6, p. 655. Address Supt. J. W. Lehman, 60 Ruggery Bldg., Columbus, Ohio.

+1622—Spokane, Wash.—The City Government will receive bids until 11 a.m., Nov. 18, for furnishing approximately 600 tons of coal as may be required during the ensuing year. Deliveries are to be in carload lots and slack, mine-run and Nos. 1 and 2 lump are required. Three separate bids are to be submitted, one to the Mayor, one to the City Clerk, and the third to the Purchasing Agent, and bids must be accompanied by a certified check for 10% of the amount bid. Address Purchasing Agent, City of Spokane, Spokane, Wash.

+1623—Lawton, N. D.—The Lillehoff School District will receive bids until Nov. 8 for furnishing Youghiogheny coal as may be required by the local schools during the ensuing year. Address Clk. H. W. Swanson, Lillehoff School Dist., Lawton, N. D.

Contracts Awarded

Note—Successful bidders are noted in **bold face type.**

+1388—Carlisle, Penn.—This contract (p. 447), which provides for furnishing the Carlisle School District with approximately 200 tons of standard Quemahoning coal, has been awarded to **J. E. Williams** at $3.30 per ton, delivered in the cellar. The distribution of the cost is as follows: Coal, $1.35; freight, $1.50; haulage, 45c. Address Chm. C. M. Liggett, Property Com., Carlisle, Penn.

+1503—Covington, Ind.—This contract (p. 577), which provides for furnishing Fountain County with coal, has been awarded to **Dick Sheaks** as follows: 200 tons for the County Farm, at $2.28 per ton f.o.b. the farm; 100 tons to the Court House, at $2.78; 60 tons to the Jail, at $2.65. Address Audr. Hyman W. Newlin, Fountain County, Covington, Ind.

1540—Davenport, Iowa—This contract (p. 617), which provides for furnishing the local Public Library with coal, has been awarded to the **Mueller Lumber Co.** at $2.93 per ton for 6-in. lump. There were six other bids on this business ranging from $2.94 to $3.25 per ton. Address Librarian, Davenport Public Library, Davenport, Iowa.

+1541—Scranton, Penn.—This contract (pp. 617, 699), which provides for furnishing the local Board of Education with proximately 2,000 bu. of mine-run coal to the high school, has been awarded to the **James J. Kearney Coal Co.**, at $2.40 per ton. Address Secy. G. E. Haak, School Bd., Administration Bldg., Scranton, Penn.

+1550—South Fork, Penn.—This contract (p. 660), which provides for furnishing the local School Board with mine-run coal as may be required, has been awarded to **Frank Hays** at $1.70 per ton. Address Secy. J. C. Penrod, Sch. Bd., South Fork, Penn.

+1552—Larksville, Penn.—This contract (p. 660), which provides for furnishing coal to the various local school buildings, has been awarded to **John Dwyer** on the following basis: Pea, $3.35; nut, $4.35; stove, $4, all per gross ton. Address Secy. Thomas Heffernan, Bd. of Edu., Larksville, Penn.

+1558—California, Penn.—This contract (p. 661), which provides for furnishing the local Public Schools with approximately 2,000 bu. of mine-run coal, has been awarded to the **Lilley Coal and Coke Co.** at 6½c. per bu. Address Secy. W. J. Weaver, California School Bd., California, Penn.

+1561—Le Mars, Iowa—This contract (p. 661), which provides for furnishing the Plymouth County Board of Supervisors with coal for the Court House, Jail and Poor during the year beginning Oct. 15, has been awarded to the **M. A. Moore Co.,** at $4.68 for Illinois lump. Other bids on this business were: Farmers Co., Lincoln County, 1¼x¾-in., for $4 45; same, lump, $4.95; W. F. Remer, Illinois lump, $4.85; Lambert Lumber Co., $5. Address County Audr. J. M. Hayes, Le Mars, Iowa.

+1562—Lewistown, Penn.—This contract (p. 661), which provides for furnishing and delivering anthracite coal as may be required at the various hose houses and town halls during the coming season, has been awarded to the **H. B. Montgomery Estate** on No. 2 coal at $5.40 per net ton. Address Secy. J. Harry Saxton, Lewistown, Penn.

1564—Cleveland, Ohio.—This contract (p. 661), which provides for furnishing the Outdoor Relief Department with coal as may be required during the ensuing year, has been awarded to the **Zettlmeyer Coal Co.,** at $2.94 per ton. Address Comr. A. R. Callow, Purchaser of Supplies, 511 City Hall, Cleveland, Ohio.

+1580—Fort Slocum, N. Y.—This contract (p. 700), which provides for furnishing the Government with coal for the steamer "General Barry" as may be required during the period beginning Nov. 1 of the current year, and ending June 30 next year, has been awarded to the **Commercial Coal Co., Inc.** (29 Broadway, New York City), at $3.39 per ton. This company was the only concern that submitted a bid for delivery in bins at Fort Slocum. Address Capt. S. E. Smith, Quartermaster Corps, U. S. Army, Fort Slocum, N. Y.

Contract Notes

San Diego, Calif.—About 25,000 tons of anthracite coal per annum is consumed for domestic purposes in this city. The average price is $12 per ton.

Pittsfield, Mass.—The City Government at this place consumes about 1,500 tons of anthracite coal which they buy locally on contracts. Address City Council, Pittsfield, Mass.

Piedmont, Ala.—The City of Piedmont consumes approximately 700 tons of bituminous mine-run per annum, which is bought at about $2 per ton. Address, Geo. H. Haslam, Piedmont, Alta.

Saxton River, Vt.—The Saxton River Woolen Co. consumes about 75 tons of coal per month. Deliveries are made by electric railroad and they have a storage capacity of 100 tons. Reynoldsville coal is being used on the present contract.

Trinidad, Colo.—The Trinidad Electric Transit Railway & Gas Co. consumes about 50,000 tons of bituminous coal per annum. The average price is about $1 per ton, and the present supplies are being furnished on a 10-year contract.

Boston, Mass.—Cocheco Woolen Mfg. Co. consumes about 200 tons of Georges Creek per month. They have a storage capacity for 1,200 tons and deliveries are made by rail. Address Pur. Agt. Samuel Rindge, 4 Winthrop Square, Boston, Mass.

Mt. Vernon, N. Y.—The Department of Public Instruction at this place buys about 1,700 tons of anthracite egg and pea coal. The call for bids is advertised and the business goes to the lowest bidder. Address E. Q. Bienvenu, Dept. of Pub. Instruction, Mt. Vernon, N. Y.

Bluffton, Ind.—The Bluffton Electric Light & Water Works consumes about 7,000 tons of nut and slack coal per annum. Purchases are made in the open market, and the usual price is about 65c. per ton. Address Supt. C. W. Clark, Bluffton Electric Light & Water Works, Bluffton, Ind.

Indianapolis, Ind.—The Indianapolis Light and Heat Co. consumes about 125,000 tons of Indiana mine-run and slack coal per annum. The present requirements are being filled on a 5-year contract at about $1.40 per ton. Address C. C. Perry, Indianapolis Light and Heat Co., Indianapolis, Ind.

Ft. Morgan, Colo.—The Municipal Light and Power plant at this place consumes approximately 3,300 tons of lignite slack and mine-run coal per annum. Purchases are confined to the open market, and the usual price is $2.10 per ton on track at Ft. Morgan. Address, Supt. Geo. G. Cox, Municipal Lt. and Water Plant, Ft. Morgan, Col.

Boston, Mass.—The contract for furnishing the City Hospital and the Calf Pasture Pumping Station with coal has been awarded to the **Northern Coal Co**. on New River coal at $3.89 for delivery at the City Hospital and $4.07 at the pumping station. The contract involves 12,500 tons and the complete list of bids made was as follows:

	City Hospital	Calf Pasture
New England Coal and Coke Co. (New River).	$3.97	$4.16
Metropolitan Coal Co. (New River)........	4.09	
Gorman Leonard Coal Co. (New River)......	4.10	
Darrow-Mann Coal Co. (New River)........	3.98	4.16
Northern Coal Co. (New River)..............	3.89	4.07
Spring Coal Co., Long Branch and Willis Mines.	3.82	4.19

For announcement of previous contract of the Metropolitan Water and Sewerage Board see contract No. 772, Vol. 7, Page 956. Address Secy. William N. Davenport, Metropolitan Water and Sewerage Board, No. 1 Ashburton Place, Boston, Mass.

Financial Department

Consolidation Coal Co.

This company reports in substance, for the fiscal year ended Dec. 31, 1914, as follows:

The shareholders on Jan. 30, 1915, authorized an increase of $8,000,000 in the limit of issue of capital stock and also an issue of $7,000,000 7% 2-year debentures, with interest payable only upon the maturity of the principal and convertible (*a*) at maturity Feb. 1, 1917, at company's option, principal and 14% interest, into capital stock or (*b*) prior to maturity at holder's option at par and interest to date of conversion as part subscription for an amount of new stock equal to 114% of the bonds held by him. The issue has been underwritten by New York bankers.

Coal Mined by the Company and Its Subsidiaries, by Divisions

	Maryland	West Virginia	Pennsylvania	Mill Creek	Elkhorn	Total Gross	Net Tons

M. bonds, are held by Equitable Trust Co. of New York, trustee, as collateral for convertible 6s.

d After deducting $70,657 adjustment of accounts of previous years.

Note—For previous annual report of this company see Vol. 6, p. 168.

The Pacific Coast Co.

This company reports under date of Aug. 27, 1914, as follows:

The past fiscal year has been one of business depression at all points and in all lines of business along the Pacific Coast. There are not as yet signs of any general improvement. Crop conditions and bank deposits are favorable for an improvement during the present year, if other influences do not interfere.

Operating expenses have been reduced as far as consistent with efficient maintenance of the properties. No expenditures for improvements are being made, with the exception of such as are necessary to finish up improvements started during previous years.

PACIFIC COAST COAL CO. (Coal Department)

Gross earnings (decreased)	$320,920.93
Operating expenses (decreased)	149,413.82
Net earnings (decreased)	171,507.11

The total output of the mines during the year was 681,729 tons, which includes 18,240 tons from mines under development; a decrease of 134,875 tons as compared with last year.

The amount of coal sold at all depots was as follows:

From company's mines, tons	657,024
Other domestic coal, tons	32,502
Foreign coal, tons	11,209
Total coal, tons	700,735

a decrease of 155,765 tons as against last year.

The average cost of output from company mines increased 20.6c. per ton. The average selling price increased 16.3 cents per ton.

Note—For previous annual report of this company see Vol. 5, p. 390.

Nova Scotia Steel & Coal

The report of the Nova Scotia Steel and Coal Co. for the year ended Dec. 31, 1914, compares as follows:

	1914	1913	1912	1911
Gross profits	$415,164	$1,255,954	$1,000,610	$1,019,392
Bd. and other int.	601,070	505,135	412,311	351,169
Deficit	185,906	750,819	588,299	668,223
Other charges	213,313	233,132	201,843	217,881
Pfd. divs	41,200	82,400	82,400	82,400
Com. divs	180,000	360,000	360,000	360,000
Deficit	620,419	75,287	55,944	7,942
Prev. surp	527,887	452,600	508,544	500,600
Tr. fr. gen. res	150,000	....	....	....
P. & L. surp	57,466	527,887	452,600	508,544

Note—For previous annual report of this company, see Vol. 5, p. 712.

DIVIDENDS

The following is a list of some of the more important dividends recently announced:

New Central Coal—Dividends of 1%, payable Nov. 1, to holders of records, Oct. 28.

Westmoreland Coal—Dividend of $1.75, payable Oct. 1, to holders of records Sept. 22 to Oct. 1.

Temple Coal Co.—Regular quarterly dividend of 2%, payable Oct. 12, to holders of records Oct. 2.

Pittsburgh Coal Co.—Regular quarterly dividend of 1½%, payable Oct. 25, to holders of records Oct. 15.

Consolidation Coal—Regularly quarterly dividend of 1½%, payable Oct. 30, to holders of records Oct. 23.

Lehigh Valley Coal Sales—Regular quarterly dividend of 2½%, payable Oct. 16, to holders of records Oct. 7.

Alabama Fuel & Iron—Regular quarterly dividend of 1% payable Oct. 1, to holders of records, Sept. 21 to Sept. 30.

Reading Co.—Regular quarterly dividend on the first preferred of 1%, payable Dec. 9, to holders of records, Nov. 23.

Delaware, Lackawanna & Western Coal—Regular quarterly dividend of 2½% payable Oct. 15, to holders of records Oct. 1.

Central Coal & Coke Co.—Regularly quarterly dividend on erly dividend of 2½% payable Oct. 15, to holders of record Sept. 30.

Island Creek Coal—Regular quarterly dividends of 50c. on the common, payable Nov. 1, to holders of records Oct. 23, and $1.50 on the preferred payable Nov. 1, to holders of records Oct. 24.

Burns Bros.—Regular quarterly dividends of 1¾% on the common, payable Nov. 15, to holders of records Nov. 1, and regular quarterly (No. 11) on the preferred of 1¾% payable Nov. 1, to holders of records Oct. 15.

COAL AGE

One of the Hill Engineering Weeklies

Vol. 8 NEW YORK, NOVEMBER 13, 1915 No. 20

Why I Believe In Safety First

Being a CREED *for the* EMPLOYER *and the* EMPLOYEE

Employer:

I BELIEVE IN SAFETY FIRST because, popular ideas to the contrary notwithstanding, I have a soul—a conscience which is torn in sympathy with the torn limbs and bodies of my workmen. ¶ Because, As An Employer, I assumed before God and man the duty of being in part my brother's keeper—his hurt is my hurt, his pain is my pain, the sorrow of his widow and the cry of his children ring in my ears after he is gone. ¶ I Believe In Safety First because waste of human ability and human life is destruction of God's most valuable product on earth, and if I fail to do my utmost to conserve that, I have left undone a *sacred* duty—committed a sin of omission, not only against my kind, but against my Creator, and must certainly give account for my delinquency. ¶ Being A Business-Man I believe in Safety First from a purely business standpoint, as well as because of its humanitarianism. I try to live up to its tenets because it is bad business policy to do otherwise. No dividends accrue to me by way of the hospital, law courts or damage suits, but *preventing* them means money for me and my company. Accident prevention promotes efficiency. ¶ Furthermore, Being In Business, I know the power of advertising my wares and my plant; and living up to the Safety First idea is the best kind of advertisement. I also know that an ounce of publicity from accidents counteracts a pound of the brand furnished by our advertising department, breeds strife, discontent and widens the breach between me and my employees, and that's the worst kind of business policy.

Employee:

I BELIEVE IN SAFETY FIRST because the loss of my ability to labor means suffering for those I love most on earth; it leaves to the mercies of a more or less indifferent world those whom every workman desires most of all to protect. ¶ I Believe In Safety First because it tends to conserve my ability to labor and that ability is my sole capital; losing it, I am bankrupt. ¶ I Believe In Safety First because my safety means the safety of my fellow-workmen. In risking myself I risk others. ¶ I Believe In Safety First because the bread I earn with my own hands is sweeter to me and mine a thousand times than charity in any form.

Both Together:

WE BELIEVE IN SAFETY FIRST because it pays in assurance, comfort, money and health. To the employer it means less worry and a larger ultimate bank account; to the workman it brings assurance of living to enjoy the fruits of his labor. ¶ It Means that mothers shall have the comforts due them in their age; That Wives shall not unnecessarily become untimely widows; That Children shall have fathers to provide for them when they need their care and protection most—when they are young. ¶ It also means that cripples and helpless wrecks who were once strong men shall not be considered a byproduct of industry.

By Sim C. Reynolds

Modern Mine-Plant Design--II

By M. L. Hyde*

SYNOPSIS—This article, which is the second of two on this subject, details the various items of equipment of the surface works.

In a steam plant, turbines as prime movers stand first. Operated noncondensing, these machines require from 35 to 50 lb. of steam per horsepower-hour. When run condensing, they use from 15 to 20 lb., the equal of the best compound engines. When waste or slack which must otherwise be stocked is used as fuel, the noncondensing type is recommended; in other cases, the condensing.

Turbines are lower in first cost than their equal in engines, require less space and smaller and lighter foundations and are easier to erect—units up to 330 kw. coming completely assembled are skidded from car to foundation direct.

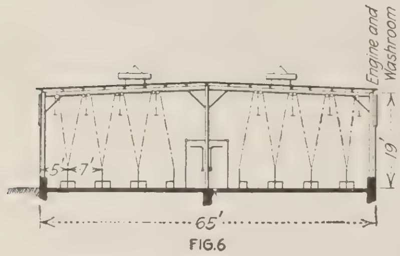

FIG.6

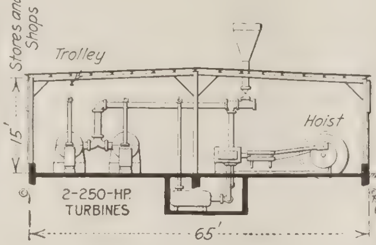

FIG.7

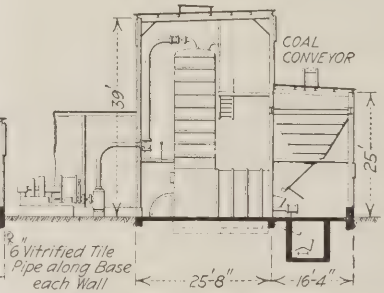

FIG.8

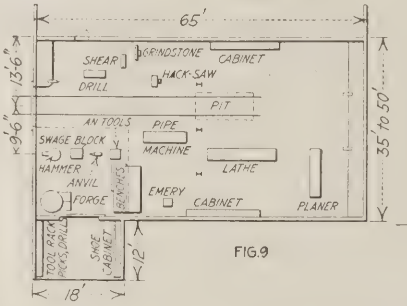

FIG.9

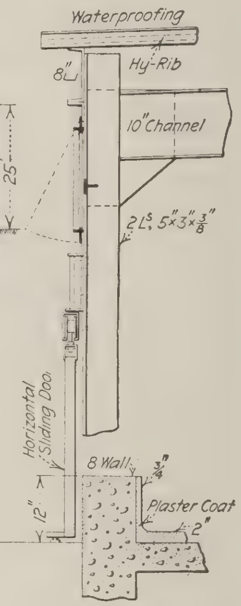

FIG.10

FIGS. 6 TO 10. SHOWING CROSS-SECTION OF WASH HOUSE, ENGINE AND BOILER ROOMS, DETAIL OF WALL CONSTRUCTION AND ARRANGEMENT OF SHOP

Allis-Chalmers, Westinghouse or General Electric turbines meet the mine requirements in every way and are recommended as being of the best types.

When compressed air is required, the vertical high-speed compressors of the Bellis & Morcum type, like this firm's vertical steam engines, stand in a class by themselves, owing to their extreme simplicity, reliability, small amount of power required to operate, noiselessness, small floor space and lower cost erected.

Steam Hoists Are Preferable

Electric hoists are not feasible at a mine generating its own steam. High first cost overrides any small economy that can be expected over even the piston valve, and none need be looked for over engines fitted with corliss valves.

Current from an outside source should cost less than ¾c. per kw.-hr. to compete with coal valued at 90c. per ton, assuming the engine without expansion uses 80 lb. of steam per shaft horsepower per hour and the boilers evaporate 7 lb. of water per pound of coal.

German tests show power consumption of an electric hoist using the Koepe disk with tail ropes (far more efficient than any arrangement of ropes and drums) to be 1.6 kw. per shaft horsepower.

Up to a shaft depth of 600 ft., the flat-faced, single-drum, first-motion hoist is preferable to the conical face with the disadvantage inherent to this style—the risk of the rope jumping its groove.

A safety device should be fitted to every hoist which will automatically close the main throttle as the cage nears the shaft collar and render it impossible to again open this valve until the hoist has been reversed. For raising above the dumping point, an auxiliary throttle may be employed. Among the best types of steam hoists are those manufactured by the Vulcan Iron Works and the Wellman-Seaver-Morgan Co.

It is necessary, when utilizing exhaust steam from the hoist engine, to provide for the periods of lull between hoists. This is done by mixed-pressure turbines, designed chiefly for low-pressure work, their steam supply being protected by means of a large steam receiver partly filled with water, which absorbs heat from the hoist engine's exhaust while hoisting and gives it up during idle periods. The receiver or regenerator may be placed outside the engine room and as close to the hoist and turbines as possible.

Switchboards should be made up of standard marble panels, set well away from the wall, so that they may be easily cleaned and repaired, while a pipe railing surrounds them for safety. Wiring diagrams posted on the wall, with the wires on the board tagged to correspond therewith, will enable anyone to follow the system and locate possible trouble.

Jet Condensers Are to Be Preferred

When sufficient water is available for condensing and it is not necessary to have condensed water for boiler feed, the simple jet condenser is preferable to the surface type.

Boilers of the vertical type are recommended for mine power plants. They are safe, simple, accessible, occupy small floor space, are moderate in cost and, most important, their system of circulation is the correct one.

---

*Pembina Coal Co., Evansburgh, Alta.

An automatic nonreturn valve on each boiler allows cutting out any unit and avoids danger of steam from other boilers flowing into it.

To get from boilers their maximum efficiency, mechanical stokers, mechanical draft and superheaters are essential. Hand-firing and natural draft are the two worst enemies of economy and not to be considered in the modern plant.

Stokers should be of the self-cleaning type to avoid hand work and the admission of cold air while cleaning. It is safer to leave their design as well as that of the draft system and superheaters to the boiler people, letting them install and guarantee this equipment complete, after first submitting them samples of the coal to be burned and the water to be used.

Venturi water meters allow of keeping records of the water consumed and give a basis on which guarantees may be made (when combined with a careful check on the coal burned and cars of ashes removed). Gas analysis and stack temperatures should also be recorded, if the mine is to be in a position to give accurate information on its product.

Steam lines must be extra heavy and well protected with a thick magnesia covering. This insulation should not be put on until steam has been carried for at least a week to enable the engineers to bring all packed joints home. Welded connections, a minimum number of joints and minimum lengths of pipe between units are to be aimed at. All pipes and connections should be accessible on each side for repairs.

Boiler blowoffs must all discharge in one direction and no opportunity be allowed for the blowoff from one boiler to back up on another. The pipes for carrying blowoff steam should be large and so arranged that there is no danger of freezing.

Open feed-water heaters are preferable to the closed type from every standpoint—first cost, saving in heat and water from condensed steam, slow depreciation, accessibility, ability to carry overloads, etc.

Centrifugal Boiler-Feed Pumps Advantageous

Centrifugal pumps for boiler feeding are rapidly becoming the standard type. They give a continuous flow of water without shock or water-hammer, are favorable to boiler-feed regulators and water meters, require but little lubrication, small floor space, are simple and reliable and, when driven by steam turbines, form the most desirable units obtainable.

Fig. 8 shows a section through a plant of good design and requiring a minimum of labor to maintain and operate. Coal is brought from the tipple by means of a Jeffrey cable conveyor (with 9-in. disks on a ⅞-in. cable) to the boiler bunker. This conveyor is set on the roof, allowing of completely housing-in the bunkers to avoid dust. It is motor-driven from the boiler-room floor.

The bunkers are of the Berquist type, combining minimum weight and upkeep expense with maximum life. All steel used is fully exposed and therefore easily kept painted.

From the bunkers the coal flows to stokers, the ash passing to a magazine under the boilers which in turn discharges to ash cars running in a tunnel below the floor.

The boilers are set in batteries of two, and space is left at one end of the room for the draft fan and engine as well as for an overhead platform supporting the hot-blast system. At each end are 10-ft. sliding doors, the opening for which should also be protected by high steel gates.

In the engine room are the turbines, hoist, switchboard, feed-water heater and pumps. The floor is of concrete and should be placed on a level with that in the rest of the building if condensing machinery is not used. Where condensing equipment is employed, the floor of the engine room should be 6 ft. above the floor in the remainder of the building.

Pipe Railings Around Hoist and Switchboard

The hoist and switchboard should be entirely surrounded by a strong pipe railing. A 10-ft. sliding door protected with an iron gate is necessary for the removal of either complete units or parts of the various machines. A crane, portable commutator grinder, telephone, enameled signal signs, fire extinguishers, sand buckets, clock, a desk and a tool cabinet should be included in the equipment.

In case power units making even a slight noise are used, it would be advisable to partition off the hoist with glass and Hy-rib.

The providing of miners with bathing facilities is now more or less general practice and eventually will become compulsory. The requisites are good ventilation, light, heat, ease in cleaning, reasonable privacy to bathers and dressers and reasonable protection to their property when left in the rooms.

The washing should always be done under showers and never in tubs, as diseases, particularly those of the eyes, are easily transmitted. A shower allows of a quick cleansing all over, is refreshing and pleasant, and the waste water is removed as fast as it falls. For each bather there is required 8 to 10 gal. of water, plus 10 more for scrubbing out the room, etc. Not over 10 min. is necessary for a comfortable bath. The faucets and all fittings should be of the strongest, as men often use considerable strength in operating them.

Clothes should be stored and dried by suspension from hooks hanging from the roof. This requires a height of 20 ft., allowing for the clothes clearing the floor by 8 ft.

The form of hook shown in Fig. 13 is a satisfactory one. These are numbered, and one is allotted to each user of the room. The hooks are hung at the end of a stout chain running over a small pulley. The other end of this chain is fastened by a padlock to the back of the bench, as shown in Fig. 13. The chains must be long enough to extend from the padlock and over the pulley to the clothes hook, with a dead length below the padlock to allow of lowering the clothes to the floor. This extra length cannot be allowed to lie on the floor, and a small partitioned trough should be set under the top bench-pipe for its reception.

Hangers should be on 20-in. centers and staggered. Benches should be of the design shown, allowing of turning the hose on the floor. Washbowls should be individual and of heavy construction. The type furnished by the Manufacturing Equipment and Engineering Co., of Boston, is recommended. Every washroom should be further equipped with a bubbling drinking fountain, locked cabinet for the keeper's supplies and garden hose for scrubbing.

The floor should be of waterproofed concrete, with rounded corners where walls and floor meet. The side walls should have three coats of white enamel to a height of 7 ft., allowing of their being scrubbed. Shower partitions may be of painted sheet iron with pipe and pipe-fitting supports.

Warm Water Is Preferred to Hot and Cold

Water with a regulated temperature of 100 deg. should be furnished. This may be heated in a standard type of heater by exhaust or live steam. Two separate pipe lines for hot and cold water complicate the plumbing and are unsatisfactory. Urinals must not be allowed in the main washroom.

The rescue station should be placed between the washroom and the warehouse on account of quiet, nearness to water and the ability of the washhouse attendant to care for it. Men on stretchers can be taken here through the washroom and thence directly outside if an ambulance is called.

The equipment should include: 1 medicine cabinet, 1 first-aid apparatus cabinet, 1 blanket chest, 2 cots, 6 ambulance stretchers, 6 rubber blankets, 6 wool blankets, 6 rockers, 1 flat-top desk and chair, 1 Siebe Gorman vivator, 1 Siebe Gorman Red Cross first-aid cabinet, 1 Siebe Gorman Red Cross pannier, 4 sets 2-hr. Proto apparatus, 4 oxygen tanks, 4 hand electric lamps, 4 axes, 4 suits oil clothes and rubber boots, 1 operating table, 1 instrument stand and sterilizer, hot-water bags, ice packs, enameled buckets, bedpans, etc.

Next to the washroom should be placed the lamproom. This should be equipped with charging racks, battery lamps, storage racks, oil lamps and a zinc-covered general-repair and cleaning bench, with lockers below carrying repairs, tools, etc. Sand buckets, fire extinguishers and record books finish the equipment.

Next to the lamproom comes an office for the use of the overmen, shotfirers and the time clerk. This should be fitted with a flat-top desk, six chairs, a record-book cabinet, telephone to main office and mine and a railed-off entrance for men awaiting orders. A private bath should open direct from this office, avoiding the necessity of the officials having to mingle with the rest of the force. This is an advantage mainly from the standpoint of discipline.

Hiring of men is all done at the main office, where they receive their checks and credentials. This eliminates the necessity of the overman's office opening onto the street and allows of placing it where all inner operations of the plant come under his eye. Where the overman does the hiring, men may be conducted to his office by the washroom attendant.

In the wareroom are kept, in tiers of bins, small tools, electric supplies, nails, spikes, repairs of all sorts, miners' tools, paints, waste, reserve stocks of lamps, magnetos, stationery, etc. The equipment should consist of numbered tiers of sectional steel bins and shelving such as made by the Berger Manufacturing Co. A desk and stool, a pair of scales, tools for opening packing cases, a truck, fire extinguishers, telephone connected with local system, index system for stock and a catalog cabinet complete the furnishings.

Partitioned from the main wareroom are two other rooms. One of these will be the auxiliary storeroom in which are stocked heavy supplies that are usually carried in piles. These will consist of brattice cloth, rope, wire, cement, fireclay, lime, roofing, building paper, heavy repair castings, etc. The other room will be for the storage of oil. It should be equipped with 8 to 10 two-barrel type-B 14-gage Boswer oil tanks, set back to back and fitted with 1-qt. pumps and nameplates. A barrel runway above these tanks allows of depositing a barrel direct from the trolley serving this room, emptying it and taking it out for reshipment.

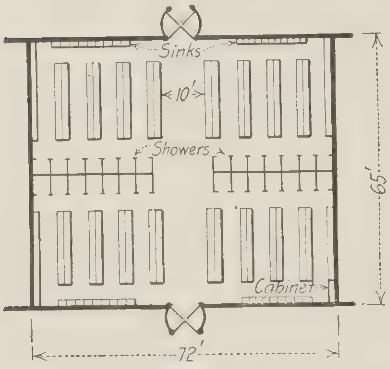

FIG.11

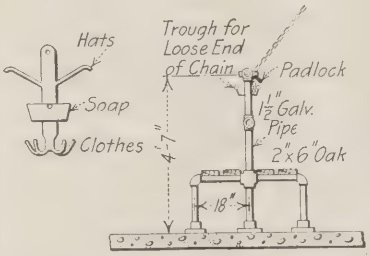

FIG.13

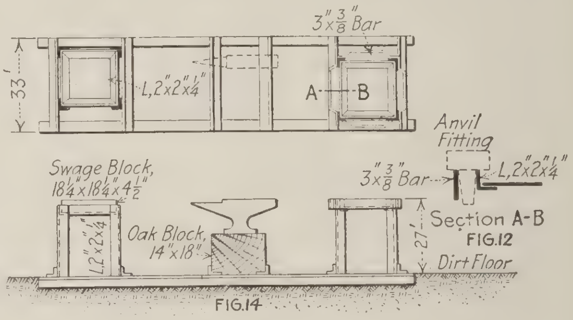

FIG.12

FIG.14

FIGS. 11 to 14. SHOWING ARRANGEMENT OF WASH ROOM AND DETAILS OF WASH-ROOM BENCH AND OF ANVIL, SWAGE BLOCK AND TOOL HOLDER IN BLACKSMITH SHOP

An objection may be raised to the storing of oils in the general building. The storage-battery lamp is becoming universal, and even in the largest operations but few of the oil type of safety lamps will be required. High-volatile oil for these lamps should be stored in an underground tank of 100 gal. or more capacity (with pipe connection leading to the lamproom), fitted with locked pump. This type of oil storage is accepted by insurance companies in the most crowded sections of large cities and is entirely safe.

In the auxiliary storeroom should be placed a small office for the warehouse foreman, with a wicket opening to the shop.

The Essentials of Good Shop Design

The important features of good shop design are light, space, proper equipment properly placed, ability to handle heavy work without manual labor or interference with other operations, and cleanliness. A shop should be lighted on three sides and have a southern exposure. Illumination should be obtained from windows set high enough to throw the light down on the machines and to avoid their being broken from careless handling of long pieces of stock or work. The walls should be painted black for a height of 6 ft. from the floor; above that, including the roof, white.

Electric clusters must be placed over each important machine, the erection floor and the anvil. An extension light should allow of inspection in the pit.

Ample space around each machine for its work, an erection floor large enough to assemble mine cars, machines or locomotives, and a concrete-lined pit (to facilitate locomotive repairs), adjacent to the erection floor, are all essential.

A standard equipment for the shops is here listed:

BLACKSMITH SHOP

1 No. 08-T Buffalo down-draft forge with 48-in. fire pan, water and coal box.

1 No. 3 Buffalo steel pressure blower, belt-driven.

1 300-lb. anvil with fittings.

1 18¼x18¼x4½-in. swage block.

1 steel combination stand, as in Fig. 14.

1 blacksmith's bench with a ⅜-in. round bar set a distance of 2 in. away from its edge, on which to hang tongs.

1 blacksmith's workbench with 50-lb. blacksmith vise and 6-in. pipe vise.

1 No. 5 Buffalo combination armorplate punch and shear without truck.

1 150-lb. Mayer's Little Giant power hammer.

1 30-in. Peerless belt-driven upright drill with power and hand feed, with a set of drills.

1 10-in. base blacksmith's taper mandrel.

1 set of hammers, tongs, bolt clippers, a 200-lb. anvil and a blower for outside work and tuyere irons for outdoor forge.

MACHINE SHOP

1 20- and 36-in. by 14-ft. Rahn Hannon Co. belt-driven gap lathe, with regular equipment of chucks, taper attachment, turret and tools. This takes the place of one large and one small lathe for making bushings, turning commutators, etc.

1 Oster pipe machine with extra dies for ½-in. to 6-in. pipe and 8 sets of bolt dies for ¼-in. to 1⅛-in. bolts.

1 36-in. by 12-ft. Niles-Bement-Pond Co. planer for making switch points and keyseats and for facing valves, etc.

1 portable Sullivan electric drill.

1 No. 2 Marvel hacksaw, belt-driven.

1 36x5-in. Keystone grindstone, belt-driven.

1 Partridge emery grinder with 1 coarse and 1 fine wheel.

1 set of pipe cutters, pipe wrenches, ratchet wrenches, blowtorch, bench and machinists' vises, diestock sets, reamers, taps, micrometer calipers, screw and wire gages, hacksaws, machinists' hammers, tinners' tools, etc.

6 Buda 1-B track jacks.

2 Jim Crow rail benders.

1 roller rail bender.

1 set of numbering stencils, etc.

2 tool cabinets.

1 general bench for electricians and machinists.

1 20-hp. motor, with necessary line shafting, bearings, belts, etc.

1 2½-ton portable Dale crane and hoist.

1 No. 51 Universal crescent wood cutter.

A device for turning over mine cars is also necessary. This can be made up of a shaft with two drums carrying ropes with hooks at their ends and a means for rotating the whole.

How the Equipment Should Be Arranged

The proper location of equipment is as follows: In one corner of the shop and next the entrance should be the blacksmith with his forge at his back, anvil in front with swage on one side and tool rack on the other. Next to the tool stand is placed a small bench on which tongs and hammers are carried. Horseshoeing should be done in a shed outside the shop. This shed should be roofed and have a horseshoe and shoeing-tool cabinet on one side and on the other, or that nearest the central lane, a numbered rack for miners' picks and drills, where they can leave them at the end of the shift and get them the following morning. This avoids their entering the shops. Across from the anvil should be set the drill press, punch and shear and the blacksmith's workbench.

The hacksaw should have a prominent, clear setting, as heavy work is brought to it at all hours. Such work should not interfere with any other work or machine. Next in importance is the pipe threader, work in which should also clear all other machines. The lathe and the planer come next in importance, while the grinding tools may be set back against the wall.

By having a tamped dirt floor under the blacksmith and giving him a down-draft forge, this department can be kept clean. The rest of the shop should be concrete floored and can be kept in good condition with little trouble.

Outside the shop should be a blacksmith-coal bin, an ash bin, a scrap-iron bin and an auxiliary rack for bar iron and pipe, also an outdoor forge and anvil for hot-weather work. It is during the summer that most of the heavy repairs are made, and to ask the blacksmith to stand over an inside forge is offering him a pretty warm job.

No woodworking tools are shown in the accompanying drawings, as it is assumed the entire equipment, including cars, will be of steel, making such machines superfluous.

Construction of Auxiliary Powder House

The auxiliary powder house should be of Hy-rib and steel construction on 8-in. concrete foundation walls, wood-lined and wood-floored. The flooring should be of 2x4-in. tongued-and-grooved milled planking on 4x4-in. sleepers laid in cinders. The woodwork should be nailed with copper nails, and a wood door with brass lock and hinges be provided. Lightning conductors should be placed at each end of the building, which should be 20 ft. long, 16 ft. wide and 8 ft. high.

This building is used for storing empty powder canisters at night and for filling them before the shift goes down. It should be fitted with numbered pigeonholes for the canisters, a wooden bench for filling and a copper hammer and chisel for opening cases. Here are brought by the industrial car each morning sufficient cases of powder from the main magazine to meet the day's requirements. If any cases are left over, they are immediately returned to the main magazine.

About 20 ft. back of the auxiliary powder house should be a small detonator storage shed of concrete, with wooden lining, enabling the warehouse foreman when issuing canisters to give out at the same time the necessary detonators.

A light housing with Hy-rib roof should cover the wet- and dry-sand bins, with a space for the sand drier between them. This allows of shoveling wet sand to the drier and from there the dry sand to its bin. S. B. Stine, Osceola Mills, Penn., makes a typical drier of good design.

Steel Tank Is Preferable to Wooden One

A 30,000-gal. tank will meet all requirements for water supply and should be placed reasonably close to the feed-water heater. A steel tank remains watertight indefinitely; there is no danger of its bursting, even in the coldest weather; and it has a life fully three times that of a wooden one. Such a tank should, however, have a steam pipe run up through the center for cold-weather protection. Below the tank a small shed should be placed for the housing of a reel carrying sufficient length of hose to protect the entire yard. This shed may also contain the electrically driven deep-well pump.

The watercloset must be convenient to all employees, yet off the main lines of travel. The fittings should be of enameled iron; urinals on one side and closets on the other. Shields are better at the entrances than doors, as it is almost impossible to keep the latter shut.

The airshaft should contain a partition so as to allow of handling supplies and men on one side (in the case of a large mine, or as an auxiliary outlet for men in the case of a small one) and air on the other. A platform cage with an end-hoist tower and a single-drum second-motion electric hoist, with rope, sheave, telephone, pneumatic signals and enameled signs form the equipment. A reversible fan of the Sirocco, Jeffrey or Sullivan type, driven by silent chain from a variable-speed motor, housed in the same building with the hoist, is recommended. In these units steel and Hy-rib again may be used to the best advantage.

In cold climates a powerful air heater should be installed on one side of the fan, assuming that when blowing, half the air is heated to a temperature sufficient to bring the whole to a point where the danger of ice forming is eliminated.

The main powder magazine should be built along lines recommended by the mining department in the state in which this building is to be erected. In case there are no particular specifications to be met, the designs recommended by the United States Bureau of Mines may well be adopted.

Arrangements should be made so that part of the bone in the waste bins under the picking tables may, instead of going to cars, be diverted to a roll crusher feeding an elevator, in turn discharging to the boiler-room coal conveyor.

It is almost impossible to ascertain the heat available from refuse until the tipple has been placed in operation, but as no additional expense is required to arrange for the possible future installation of the apparatus described, such arrangements should in every case be made when the tipple is being built.

⁂

An Interesting Pennsylvania Mine

By J. P. Vogel*

SYNOPSIS—A large preparation plant is here described. The capacity is 6,000 tons daily, and the bone coal secured in the picking process furnishes fuel to a large steam-driven central power station.

The Lucerne mines of the Jefferson & Clearfield Coal and Iron Co. are located at Lucerne, Penn., on the Buffalo, Rochester & Pittsburgh R.R., about 5 mi. from Indiana. This plant was built in 1914, and the surface improvements are of the most substantial and permanent character.

At the time this plant was designed, the power requirements for these, as well as for some other then existing mines of the company and still others it contemplated building, were such as to warrant the erection of a large power station. Lucerne was centrally located, and the good water-supply and cheap boiler fuel available from the preparation plant made it an ideal location for the central power station.

The Freeport seam of coal is here mined, being reached through two drifts and one shaft. The great care with which this coal is prepared for the market made an efficient preparation plant imperative; and for economy, both in first costs and operation, the central preparation plant, or tipple, was built to receive the coal from both the drifts and the shaft.

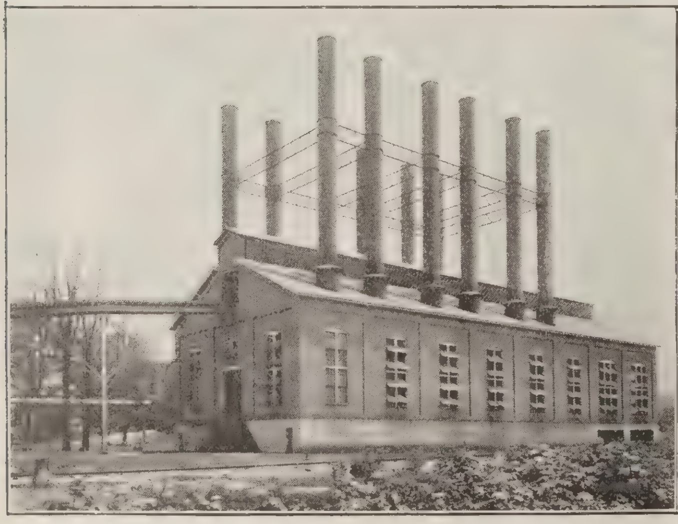

FIG. 1. LUCERNE POWER STATION

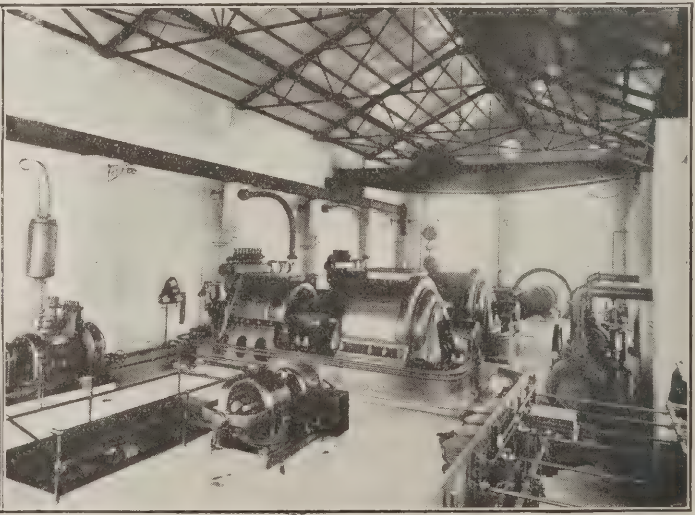

FIG. 2. INTERIOR OF POWER STATION

The accompanying Figs. 1, 2 and 3 show exterior and interior views of the power station, which is of brick and concrete construction. Steam is generated in twelve

---

*Pittsburgh, Penn.

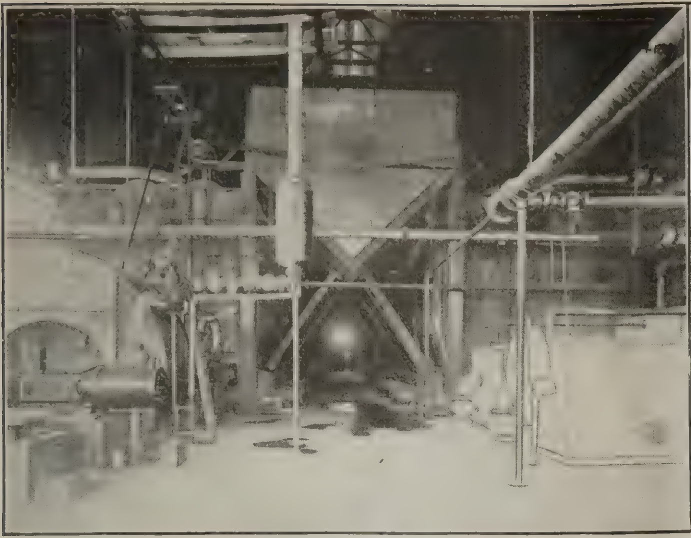

FIG. 3. ANOTHER VIEW IN POWER PLANT

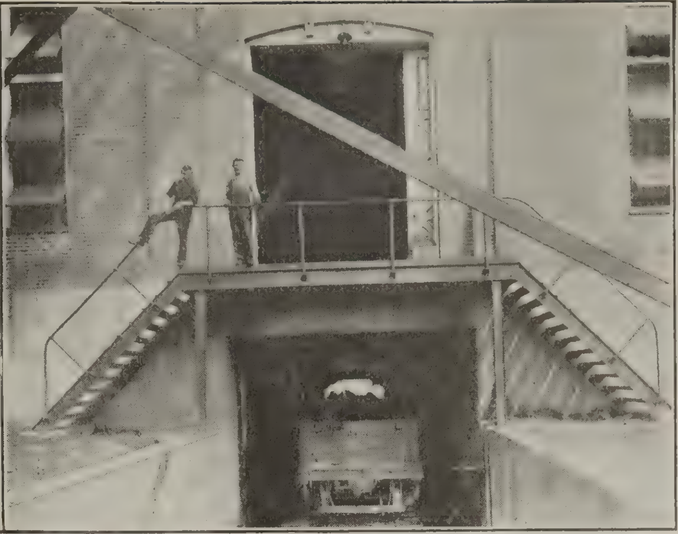

FIG. 4. ASHES ARE DELIVERED TO GONDOLA CARS

500-hp. Stirling boilers—three batteries of two boilers each on either side of the boiler house. These units are equipped with Jones underfeed stokers, fed from an overhead steel-and-concrete bin. It should here be noted that the fuel for this boiler plant consists, when running normally, of practically all bone coal, or refuse that has been separated from the coal in the preparation plant. This not only makes cheap boiler fuel, but greatly reduces the volume of this refuse, and to that extent simplifies the ever-growing serious problem of waste disposal.

The water-supply is taken from a local stream (Yellow Creek) and is heated and slightly treated in Cochrane feed-water heaters which receive exhaust steam from the smaller engines. The ash is delivered directly to gondola cars from the stokers, as shown by Fig. 4.

Fig. 5 shows the headframe over the shaft, which is located several hundred feet from the power house. As will be noted, this headframe is of steel construction. The shaft at this point is a three-compartment one—one compartment is a pipeway and the other two, or hoist compartments, are arranged for using tandem cages which hoist two cars at a time from the mine.

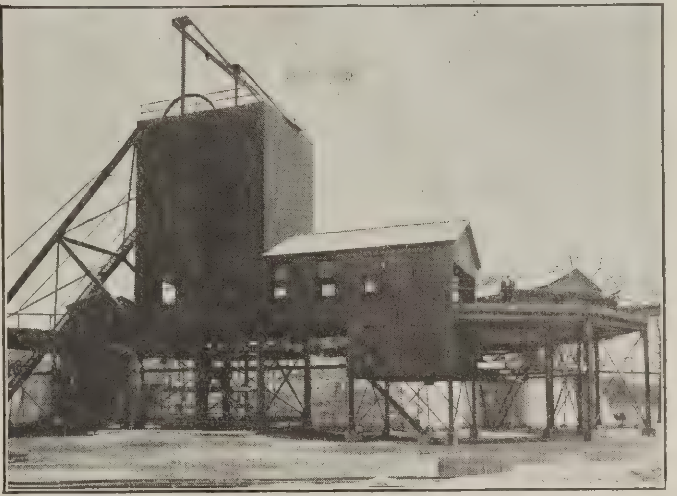

FIG. 5. HEADFRAME OVER SHAFT

Loaded and empty cars are handled to and from the cages, as well as trips of loaded and empty cars by electrically driven car-caging and trip-handling apparatus, which reduces labor at this point to a minimum. From here to the tipple, or preparation plant, is a distance of about 4,000 ft., and loaded and empty cars are handled between these points by electric haulage motors pulling trips composed of 60 cars or thereabout to each trip.

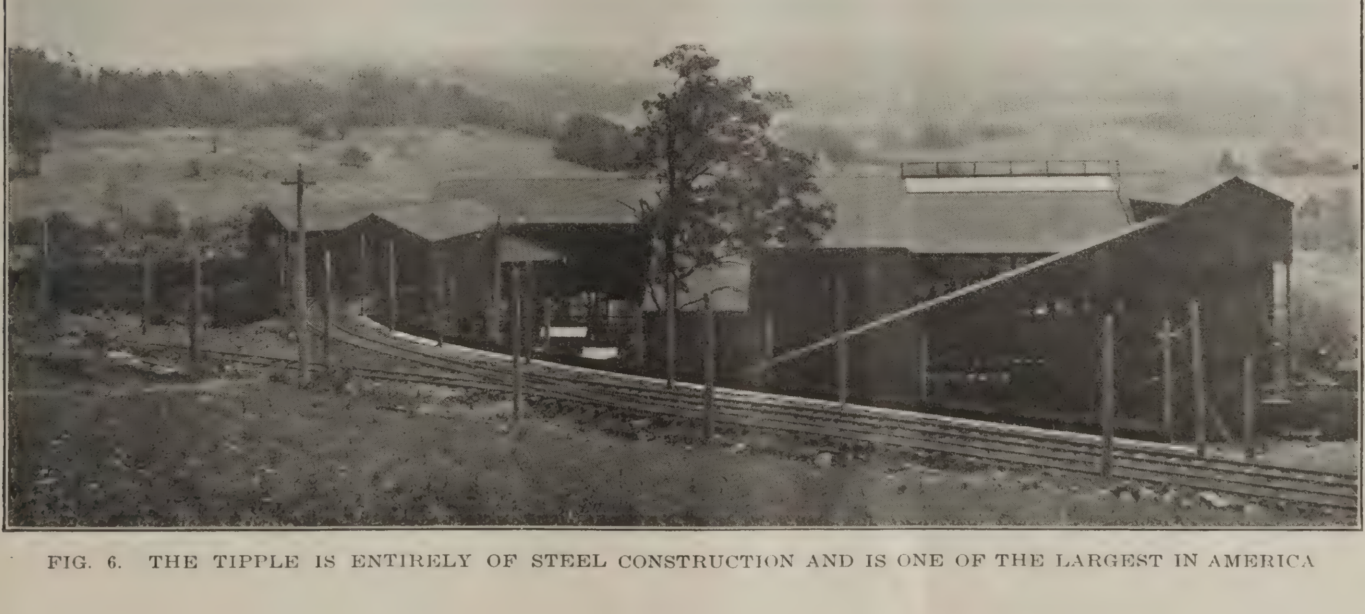

FIG. 6. THE TIPPLE IS ENTIRELY OF STEEL CONSTRUCTION AND IS ONE OF THE LARGEST IN AMERICA

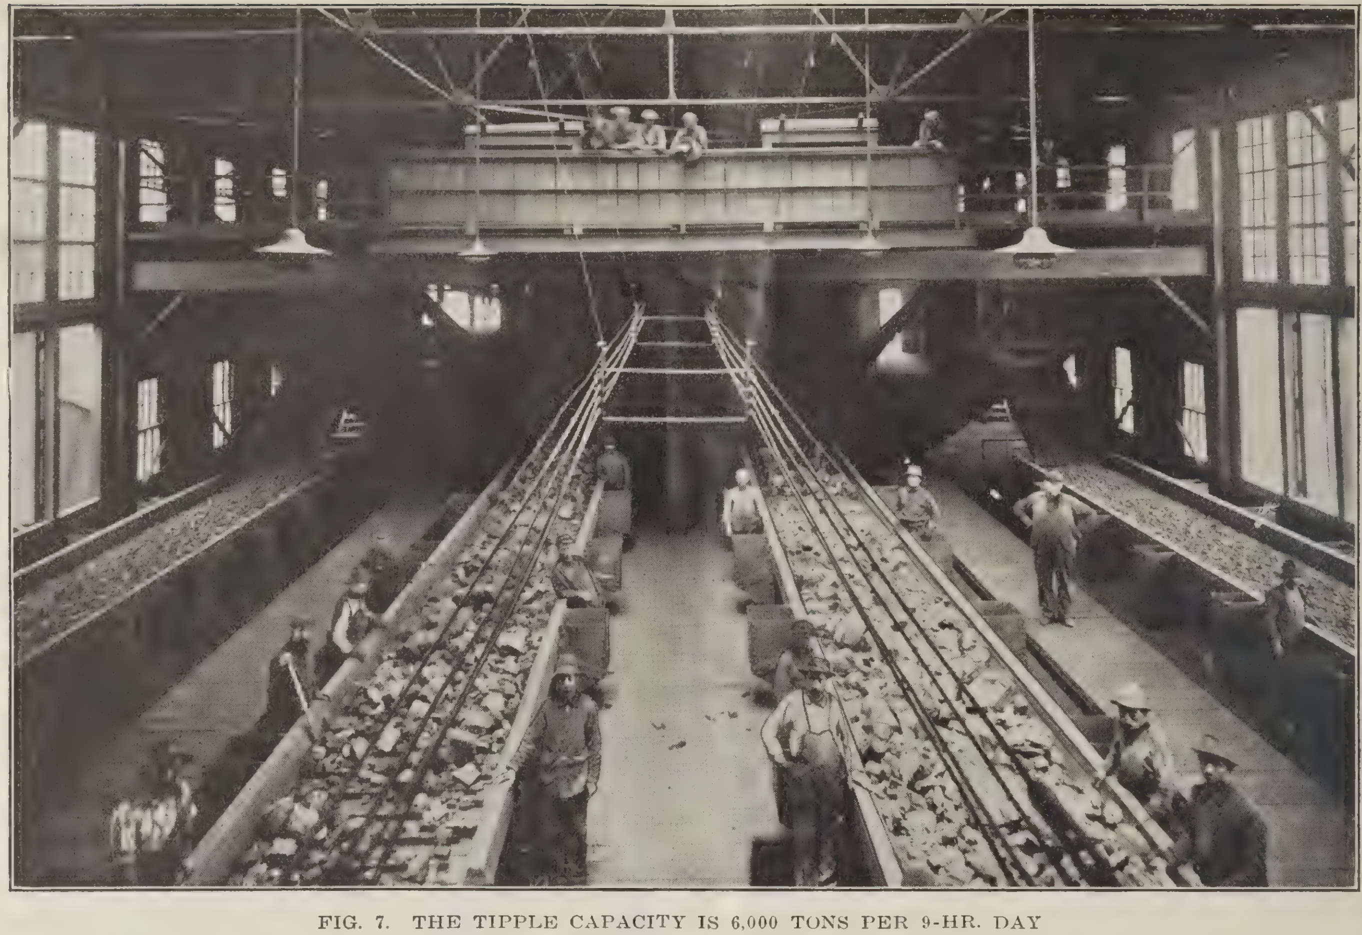

FIG. 7. THE TIPPLE CAPACITY IS 6,000 TONS PER 9-HR. DAY

The tipple at Lucerne, as shown in Figs. 6 and 7, is entirely of steel construction and is one of the largest and the most complete preparation plants installed at a bituminous mine in this country. The capacity is 6,000 tons of coal per 9-hr. day, and the entire tipple is built in two parallel units, each entirely independent of the other.

Loaded pit cars are brought into this tipple from two sides—one from the shaft and the other from the two drifts. Upon the arrival of the loaded trips at these approaches or landings, they are passed through the tipple mechanically. Endless chains with dogs feed the loaded cars into the tipple at a uniform rate, and cars are stopped before reaching the scales by car-feed regulators.

From here loaded cars pass over scales through two crossover dumps to kick-backs which return the empty cars by gravity to trip-makers that make up the trips of cars ready to be coupled and returned to the mine. The operations of the trip-feeders, car regulators and trip-makers are controlled by one man in the operating tower in the tipple.

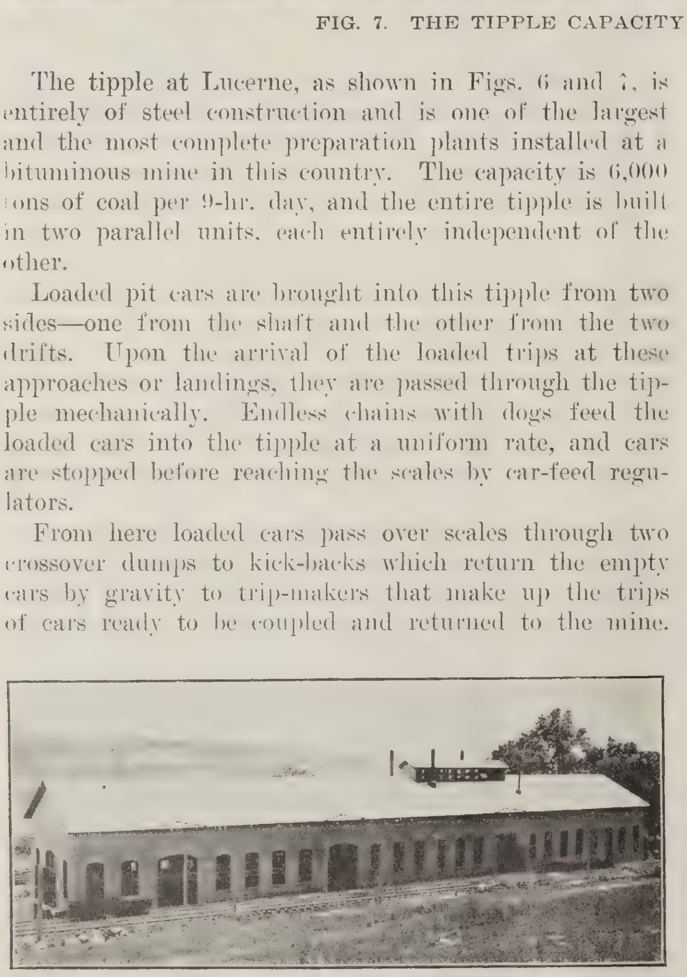

FIG. 8. THE MACHINE, BLACKSMITH AND CARPENTER SHOP

From the dump, coal is passed to a feeder which delivers it uniformly to the shaking screen. This screen makes two grades of coal—lump, and nut and slack. The lump is passed directly to the picking table, while the nut and slack is delivered to a revolving screen which separates it, the nut passing to a nut picking table and the slack to a combination conveyor.

After the lump and nut are picked, they are either loaded separately or mixed to form various grades of coal. The refuse that is picked from the coal is delivered through chutes at the side of the men to a conveyor which delivers it to a refuse picking table. Here the bone, after having the distinct slate picked from it, is delivered to a crusher which reduces it and stores it in a bin at the front of the tipple until it is taken by an electrically driven larry to the boiler house. The entire operation of all apparatus making up the two units is under the control of one man stationed in the front of the picking house.

Fig. 8 shows the shop at Lucerne, which is built of brick. This shop is divided into three parts—that is, machine, blacksmith and carpenter departments—and is well and adequately equipped with modern electrically driven tools.

This plant was designed and built under the direction of L. W. Robinson, president of the Jefferson & Clearfield Coal and Iron Co., at Punxsutawney, Penn., by Heyl & Patterson, Inc., contracting engineers, of Pittsburgh, Penn.

Mine Inspectors' Institute of the United States of America[*]

SYNOPSIS—Aims and purposes of the Institute and the benefits to be derived from association in the work of mine inspection. Results accomplished by the inspectors shown by the improvement in mining conditions and the reduction in number of accidents. Depression in mining to be succeeded by great prosperity. Future of the Institute.

Fellow Members of the Mine Inspectors' Institute of the United States of America:

This is the eighth annual conference of this Institute. It affords me great pleasure to have the honor of bidding you welcome to this meeting and especially to the City of St. Louis. I feel very grateful to George Hill, the Chief Inspector of Mines, and his able associates, in Missouri, for the splendid assistance they have rendered to make your visit here pleasant and I hope all may find it profitable.

Aims and Purposes of Institute

Owing to some changes in the membership of the Institute each year, it may not be amiss to state at this time some of the reasons why there should be an organization of mine inspectors maintained and meetings of this kind held yearly. The work of mine inspectors is the same everywhere and it makes no difference as to the length of time one has been in the service. His chief problem is: How can I as an inspector bring about a better protection of the lives and health of the men employed in and about the mines? By reason of such an organization as this much can be done that cannot be accomplished by the individual.

Our national and state governments are managed by organization. In fact, to accomplish any good results, whether political or otherwise, it must be done by having effective organization. Therefore, the reason is all the greater why we as mine inspectors should organize, having in view the adoption of such remedial legislation in our various states as shall bring about the best results. The public expect that mine inspectors, who have opportunity to acquire a more intimate knowledge of the various mining conditions, shall take the initiative in the promulgating of measures that will be the means of reducing the hazards in connection with the mining industry, so that it will be as safe to follow mining as any other line of industry.

Benefits and Need of Association

These meetings afford an excellent opportunity to bring about a closer relationship, or rather comradeship, than can be gained in any other manner. The discussion of the numerous problems that arise in one's daily vocation gives us all inspiration and renewed energy, so that we go back to our respective fields of labor with renewed zeal and a determination to give our best service for the good of those employed in and around the mines in our charge. The mine inspector may be less conspicuous than other forces, in the service he renders for the good of mine employees; but his daily contact with the workmen gives him an influence that, if properly and intelligently directed, will be the means of bringing about better results for their welfare than all other agencies.

This statement is not made with the intention of minimizing the work that is being done by other organizations. I firmly believe that any organization that is engaged in the work of raising the standard of efficiency among mine workers should have the hearty endorsement of this Institute. It is true that we have connected with the mining industry a great many men of foreign birth who do not understand the English language, neither our methods nor our form of government. Therefore, any effort that is being made to develop skilled workmen where they are unskilled, and to instruct the unintelligent, is a laudable work and will reward one with the knowledge that his efforts have been the means of reducing the hazards and accidents in the mines.

Development and Improvements

Mine inspectors who have been identified with the service during the last twenty years have reason to note the wonderful development and the many improvements made in the mining industry. With the larger number of men employed, the responsibilities and dangers attendant on mining have increased proportionately. Since our last meeting one year ago there have occurred three disastrous explosions in which over 400 lives were lost; namely, Hillcrest, Alberta, Canada (June 19); Royalton, Ill. (Oct. 27); and Layland, W. Va. (Mar. 2). None regret these dreaded catastrophes more than the members of this Institute. Knowing full well all the hazards and dangers connected with the rescue work, especially where there are many lives at stake, the sympathy of our members always extends to those inspectors in whose districts these disasters occur.

It is to be regretted that when accidents of this kind occur the newspapers often give incorrect reports, some of these being very ridiculous and of such a nature as to engender feeling between the officials of the different departments engaged in the work of rescue. The great work that devolves on all officials in their efforts to make mines as secure as possible against accident is one of the gravest of responsibilities and necessitates eternal vigilance. In time of accident or disaster, those whose duty it is to render all possible aid should bring all their experience and knowledge into immediate service. Friction should and must be avoided and diversity of interest obliterated where all are engaged in the noble work of saving those who are suddenly menaced in their hazardous calling.

The occupation of the miner is considered hazardous at the best, but many lives are often lost that could have been saved. The accidents that occur daily in mines are not due as much to the lack of legislation as to the lack of obedience and the closer observance of mine laws and regulations. Much work waits to be done by this Institute, and I believe that no men are better prepared than are the mine inspectors of this country to bring about better conditions and to advocate legislation that will better safeguard life and reduce the death rate and accidents in mines to a minimum.

---

[*] President's address delivered at the eighth annual meeting of the Institute, held in St. Louis, Mo., June 8-11, 1915.

Reduction in Number of Accidents

It is gratifying to know that there has been a reduction in the number of fatal accidents in the coal mines of the United States during the year 1914, and with the exception of 1912 the death rate, per thousand men employed, is lower than for any year since 1903. In the year 1914 the number of fatalities in and about the mines was 2,451, which is 3.30 deaths to every 1,000 persons employed, or 4.80 to every 1,000,000 tons of coal produced, or one person killed for each 208,333 tons. This is the largest production of coal per fatal accident in this country, with the exception of that for 1912. There is no doubt but that the gradual decrease shown in the last few years must be attributed to the work of the many organizations having in view the prevention of accidents; and this applies not only to mines but to all other industries as well. But that we may have a reduction of accidents to a minimum requires that the work so well begun be carried forward, bearing in mind that eternal vigilance on the part of all connected with mining is necessary.

In looking over the statistics giving the causes of mine accidents it would seem that, with all our efforts, we have not been able to reduce the number of those due to falls of roof, coal and rock. The percentage of these accidents remains practically the same in all the states. Taking the United States as a whole, the proportion was 46 per cent., while in the state of Illinois, for the year ending June 30, 1914, it was 52 per cent.

I desire to draw your attention to what I consider the most dangerous work connected with the operation of mines, as shown by the number of fatalities due to pit cars and locomotives. In the United States the number of fatalities from this cause is 15 per cent., while in the State of Illinois, for the year ending June 30, 1914, it was 25 per cent. When we consider the number of employees engaged in this work, which varies from 6 to 8 per cent., these statistics show about one person killed for every 150 employed in that work.

Miners Constantly Take Chances

I mention these matters for your consideration and ask you to suggest what this Institute should do in regard to reducing the accidents from these two sources. I think I am not overstepping the truth when I say that one-half of the accidents could be prevented if mine employees would live up to the legal requirements and carry out conscientiously the various rules and regulations governing their work, instead of taking chances by ignoring them. In this connection I may be pardoned for quoting a verse written by Berton Braley and published in *Coal Age* (Vol. 3, p. 711), entitled "The Gamblers." It runs as follows:

"We'll take a chance—we're not afraid of dangers,
There's nothing killed us *yet,* so we're all right,
To every sort of worry we are strangers,
And so you see us, always gay and bright;
Maybe some day the roof will fall and get us,
The dynamite may go off in advance,
The gas explode, but we won't let it fret us,
We'll take a chance!"

I may mention, though with much regret, that the industry with which we are identified is passing through an era of depression such as it has not known for many years. In the State of Illinois alone, in which there are 80,000 mine employees, it is safe to say that not more than one-half have employment at the present time. The same condition prevails in many of the other coal-producing states, which means many hardships to the wives and children who are dependent on these men. However, when we think of the carnage of human life that is occurring among the European nations and that we, as a people, are at peace with all nations, we have great reason to be thankful. There is no doubt in my mind but that the present depression is a reflex of conditions that now prevail owing to the strife among European nations. I am sure it is the desire of all our people that there may be a speedy cessation of hostilities among the warring nations. I believe when that takes place this country will reap a greater measure of prosperity than it has ever known in its history. It is true that few nations, if any, excel this country in natural wealth and resources, and an abundance can be produced to supply the needs of all within its borders, and much to spare to the countries that are less fortunate.

Future of the Institute

I wish to draw your attention to the fact that if this Institute is not accomplishing the results intended by having an association of this kind, the fault is entirely our own. I believe there is one object in particular that is preventing and proving a hindrance to its success as an Institute. I refer now to our failure to use it as a medium to reach the people and the governmental powers. Therefore I recommend that some steps be taken at this meeting that will require that a change be made in the constitution and bylaws of the Institute so that the subjects discussed and which appear to be of sufficient interest to the mining industry be given immediate publicity through the periodicals that publish matters relating to mining.

I want to suggest here that there will be less delay in the publication of our proceedings if all papers are sent direct to the editor in chief, who is their custodian, as provided by the constitution, and whose duty is to pass on all papers to be read and to prepare them for publication within 60 days after the adjournment of each annual meeting.

I know of no organization of men whose aims and ideals are more lofty than the men who make up the membership of this Institute. You have been selected by your states as men in whom they have the fullest confidence, believing that you will devote your time to the work of your office and require that every precaution be taken necessary to insure the health and safety of the men employed in the mines. There is no more laudable work than that in which you are engaged, and that is the preservation of human life.

⁂

The Life of Mine Timbers can be greatly lengthened by making a careful study of the character of the roof they support. With a strong roof and bottom, the timbering should be so set as to allow the roof to settle easily and gradually, or the floor to heave, thus preventing the waste of timber due to breakage which is sure to occur if the roof falls abruptly. With a strong roof and floor, loosely driven timbering and soft wood caps will prevent the bending and breaking of the timber. Tapered props, the small end of which is about one-fourth the size of the body of the prop, give good results and last longer than ordinary timbering.

A New Era for Mining Towns

By Karl B. Lohmann*

SYNOPSIS—The attitude of mine owners toward the planning and development of coal communities has radically changed for the better. The results of the application of scientific treatment to mining towns are greater self-respect and increased efficiency on the part of the employees.

Science and tradition both tell us that a pig was once an object of filth. He was fed upon waste. He breathed, slept and wallowed in grime. Otherwise, it seemed, he could not be happy—he could not live.

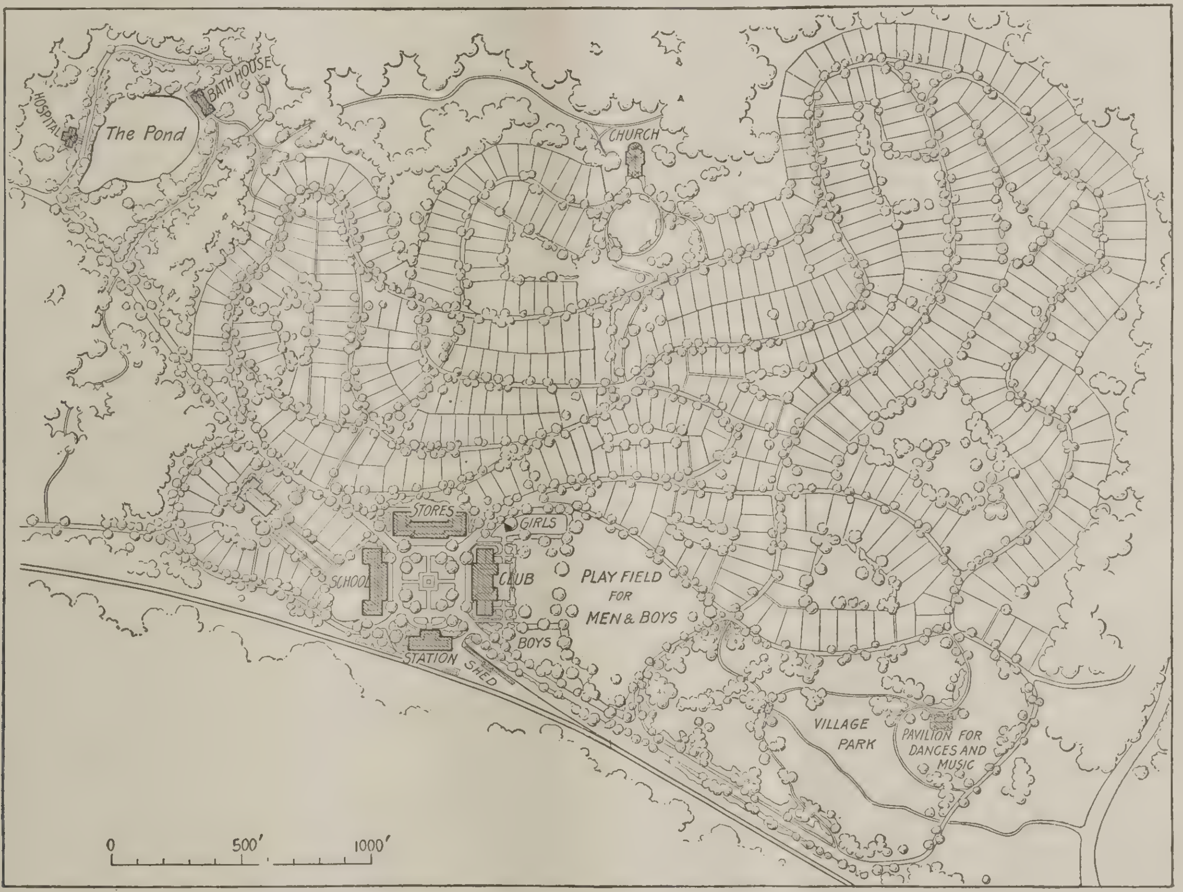
Time has changed his status, however. No longer do we find such prevailing filth in the pig's domain. We see him afforded good food and good air, and we find him disporting himself quite merrily amid new surroundings. Indeed, his environment has been very much transformed. Yet it appears that not only can he live under the new conditions, but that he can live far better and live far more profitably to mankind.

In somewhat the same manner we have long been complacent at the sight of ill-planned mining villages, with their squalid shacks, inconveniently disposed streets, and desolate homes with unattractive surroundings. Recreation grounds were unknown, and the entire camp was symbolic of chaos and filth. We have for a long time imagined that in any other surroundings the workers and their families could not be happy. If we should give them bathtubs, they would use them for coal. If we should give them good streets, they would use them for ashes.

General Opinion Has Changed

Time, however, has also changed our attitude in this respect. We now behold a better day in the dawning for mining towns. We realize it in the prize awards by coal companies for better yards and gardens and the tender care of them; we see it in the frequently recurring better streets, and now and then, though rarely, in an entire mining community developed along advanced lines.

And well may it be, this awakening; for multitudes of workers and their families are yet to be huddled together or pleasantly and conveniently provided for in communities still unborn. Mining towns are being built, and hundreds of others are in a process of improvement or of necessary extension and enlargement. Therefore the appropriate day for planning is not of the past, but rather eminently is of the present.



A SCIENTIFIC AND ARTISTIC PLAN FOR A MINING TOWN

This impulse of a new dawn is fraught, however, with as much bad as good, unless it is properly guided. For instance, awakening civic consciousness, in its enthusiasm for improved cities, often is accompanied by and allows of too many unscientific and inartistic results. It is not because insufficient money is expended. It results probably from everybody thinking that he knows how to handle any given situation, together with an indifference to the advice of experts that is far too common. Similarly, in the planning of mining towns there is offered an immense scope for the poor taste of untrained individualism. Mine operators think that their engineering departments are just as perfectly capable of designing parks, gardens, villages and towns as they are of deciding upon the intricate problems of breakers and their accessories, as if town-planning were not a science in itself.

---

*Landscape architect, Wilkes-Barre, Penn.

Be that as it may, whosoever is commissioned to design a mining-community extension or a brand-new development can never hope to accomplish it successfully, be he engineer or landscape architect, lest he consider it in a new, far-reaching light. His impulse must be guided by planning that is comprehensive, and this cannot be emphasized too strongly.

Comprehensive planning means primarily taking everything into consideration. It means leaving no stone unturned, whether it be engineering, architecture or landscape architecture. It calls for inclusive, encompassing planning. It presupposes a broad perspective over the entire community, a breadth of inter-relationships, a recognition of advance provision for things comprehensively needed, with due consideration of the bearing of one thing upon other things—that the parts are members of the whole. In short, it compels a full understanding of the entire problem.

Great Results Will Be Obtained

If the awakening impulse for better planning is properly guided, it may be expected to accomplish immeasurable achievement. For the present population who are now to enjoy its fruits, it will bring about added commodity and service. For instance, the men's work will be readily accessible. Their homes, in turn, will be accessible to each other. The community at large may possess in general the greatest number of conveniences available at the time of reasonable planning, such as water-supply, drainage, light, good soil, proximity to a through line of travel. There would be secured to the population ample health in provision for plenty of air, parks, playgrounds, trees along the streets and all preconsidered means of keeping the town clean.

Also, the dawn may illumine the way for better and more commodious environment that will help to conserve the moral and physical forces of the workers. There will be added pride in towns, in homes and in work. There will be an increasing solidarity of feeling in spirit with the companies. So that the crowning glory of any comprehensive planning efforts, from the company standpoint at least, will be an added contentment and efficiency among its workers.

This much may be expected for the present population, for those who live in the communities now. Yet our efforts will not be unmindful of the future. Such comprehensive planning, such broad-outlook-into-the-future sort of planning, will result in more intelligent and adequate expansion of the community. New homes that will have to be built may become part of this same community and be co-sharer in its sometime advantages and developments. Any necessary extended streets will not have to cross a ravine or mountain. And every commodity and means for added efficiency in turn will be applied to the enlarged area of a later time, whether 5, 10 or 15 years hence.

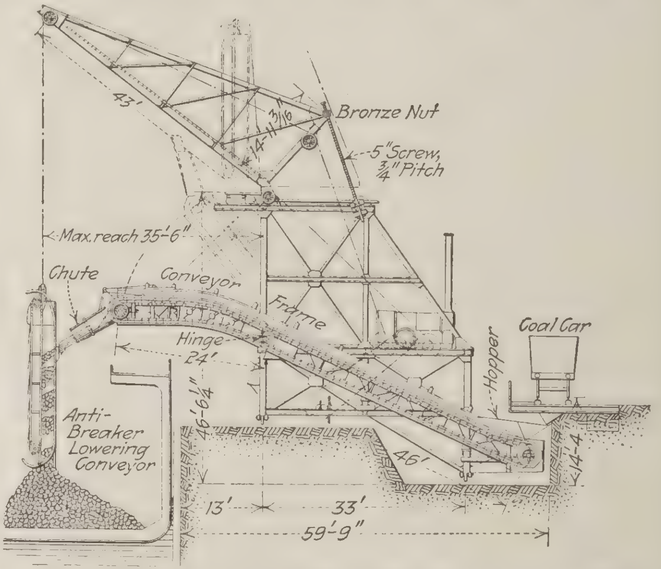
Such planning therefore signals the approach of a new era for mining towns. They need no longer be pictures of desolation and squalor. Every yard, every street, every community is being touched with a new impulse—an impulse which by inspiring environment destroys the morbid cause for much industrial unrest, which Americanizes and draws men into closer harmony with the employer and, most important of all, which brings the workers themselves ultimately to an added sense of their part in the great scheme of things.

⁂

English Ship-Coaling Machine

A coal-shipping plant installed at Workington, England, is designed specially to handle the coal with a minimum of breakage. The machine is carried by a tower traveling on a track 120 ft. long near the edge of the dock, the rails having a gage of 33 ft. In the rear of this track, and above it, is a track for the drop-bottom coal cars, the coal being discharged between the rails and delivered to a hopper on the end of a conveyor frame, which extends through the tower.

The conveyor consists of a traveling belt of steel plates 4 ft. wide, running at about 120 ft. per min. The outer end of the conveyor frame is adjustable, having trunnion bearings in the front of the tower, so that it can be raised or lowered to clear deck fixtures and to give the coal as little drop as possible. The conveyor and the propelling machinery are driven from a 40-hp. engine.



MACHINE FOR COALING SHIPS, WORKINGTON HARBOR

A chute on the end of the conveyor frame delivers the coal to a Handcock antibreaker. This is a vertical tube suspended from a boom on the tower, and containing a series of trays attached to endless chains. The weight of the coal as it flows into the tube operates this vertical lowering conveyor. The loaded trays descend, free the coal at the bottom, and then ascend empty. An automatic brake controls the speed.

In coaling a ship, the tube is lowered till its open end is nearly on the floor of the hull, and as the coal is delivered the tube is gradually raised, keeping its end level with the top of the coal pile, so that the coal flows out without a direct drop. This machine (described in *The Engineer*, of London, July 2) is designed to deliver 400 tons of coal per hour, but can work at the rate of 600 tons per hour. It was built by F. Turnbull & Co., of Newcastle-on-Tyne, to the designs of Cecil Walton, engineer for the Workington Harbor Board, and under the direction of Bowen Cooke, chief engineer of the London & Northwestern Ry.—*Engineering News.*

Loose Mining Methods

By Illinois Engineer

The folly of loose mining methods is sometimes forcibly impressed on the mind of the operator in the form of dollars and cents. Such was the case recently when a surface settlement, caused by the removal of too large a percentage of the underlying coal, damaged property to the extent of at least $7,000.

Had the rooms in the affected area been turned on the proper centers and driven on line, as is the practice in most mines in the same field, the trouble would probably have been avoided. As it was, no room sights were used; the result was that pillars of various sizes were formed. Where the thickness of the pillar permitted, additional rooms were turned off the crosscuts.

The profit obtained from the sale of the additional coal mined from the affected area by this haphazard method was approximately $2,000. This does not compare favorably with the $7,000 or more which will be paid out in damages. The handling of the additional inflow of water is another item of cost to be considered. Eight acres of an overlying seam 4½ ft. thick was damaged to such an extent as to be unminable. In addition to this, more coal will probably be lost in mining around the squeeze than was originally obtained by splitting the pillars.

The foregoing is a conservative estimate of the cost, but proves conclusively, at least in this instance, that loose mining methods do not pay. Risking expensive damage suits for the profit obtained from a comparatively few tons of coal is, in my opinion, short-sighted policy.

Shipments to Upper Lake Docks

Receipts of coal at Milwaukee will have to be abnormally large during the remainder of the navigation season if the record of 1914 is to be maintained. Owing to the fact that the grain and iron-ore trades are practically absorbing all of the larger class of vessels and that higher freight rates will have to be paid as the close of season approaches, this is hardly possible. As a result the coal handlers will face the uncertain requirements of the coming winter with very moderate stocks. Should there be any hitch between the miners and operators next spring and the early movement by lake be delayed in consequence, the lack of supplies will be seriously felt.

Up to Oct. 1 of this year the receipts of anthracite coal aggregated 731,759 tons, or 14,875 tons more than was received during the same period in 1914. In order to equal last year's receipts of anthracite, arrivals during October, November and December will have to aggregate 318,402 tons.

The soft-coal shortage during this same period sums up 424,224 tons, the receipts aggregating 2,197,337 tons, as against 3,197,337 tons in 1914. Stocks will have to be augmented to the extent of 1,297,239 tons during October, November and December to bring the soft-coal shipments up to the level of 1914.

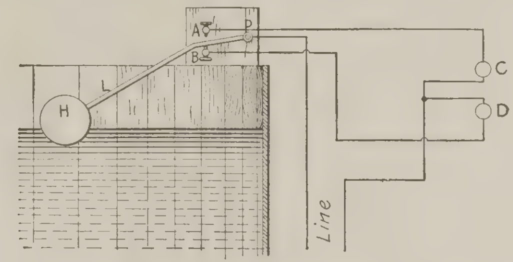
Every effort will be made on the part of coal companies to increase the supply, and the prospect is that the winter-storage fleet will be much larger than usual. Dealers report that coal is moving out more satisfactorily and that business in general has a promising aspect.

Signal for Water-Supply Tank

By C. J. Fuetter

Now that cold weather is soon to be with us again every power-house engineer who has to look after a water tank placed on a hill to supply water to the town knows how unpleasant it is to go out of a warm engine-room to find out how much water he has in the tank. Many such engineers let the pump run most of the time at full speed, in which case it generally happens that the tank overflows.

This is a waste of power, for at a small cost a signal system may be installed that would take care of the water-supply. Such a system is shown in the accompanying sketch. It is designed to work on either a 110- or 220-volt circuit; however, should only 550 volts be available, two 250-volt lamps in series at *C* and two at *D* would be all the changes necessary. *H* is a hollow ball made of copper. It may also be made of cork.



SIGNAL FOR WATER-SUPPLY TANK

This ball is fastened at the end of level *L*, which is pivoted at *P*, its rise or fall completing the circuit of *C* and *D*. If rising, *L* makes contact with the adjustable screw *A* and will light lamp *C*; if falling, it makes contact with *B* and lights the lamp *B*. The last mentioned lamp should preferably be red. A means must be provided so that any undue rise will not bend the lever. This may be accomplished by using contact springs instead of contact screws. It might be well to solder a small piece of silver at the contact points *A* and *B*. Lights *C* and *D* should be so placed in the engine-room that the engineer's attention will be readily drawn to them.

Should no current be available, the signal could be arranged to work with bells, by placing 4 or 5 dry-cells across the lines, with a small bell at *C* and another at *D*. Of course the ring of these bells should have different sounds so that the engineer will know whether the water is high or low, thus indicating to him whether he should slow down or speed up the pump.

New Coal Fields in Manchuria

New coal fields are reported to have been discovered near Station Manchuli by the local chief of police, says *Commerce Reports*. The fields are located about 5 mi. from the Station Manchuli and 2 mi. from the railway line. The discoverer has offered to sell his right in the deposits to the Chinese Eastern Ry., which is investigating the amount and quality of the coal.

Pennsylvania State Tax Upon Anthracite Invalid

SYNOPSIS—The Supreme Court of Pennsylvania has reversed the decision of the lower court and has declared the imposition of a state tax upon anthracite as unconstitutional under the conditions specified. The decision will cause much confusion in making refunds. The State Legislature has already taken action toward the enactment of a law that will meet with the approval of the Supreme Court.

The Pennsylvania State Supreme Court has declared the legislative enactment of 1913 levying a tax of 2½ per cent. per gross ton on the value of anthracite coal at the mines to be unconstitutional. The case reached the Supreme Court on an appeal by the Alden Coal Co. against the decision of the Court of Common Pleas of Dauphin County, which declared the act constitutional and rendered judgment in favor of the state against the coal company for $7,792.86, being the amount of taxes assessed against the Alden company for coal mined and prepared for market from June 28, 1913, the time the law became effective, and ending Dec. 31, 1913. In the decision of the Supreme Court, which was written by Justice Stewart, the contention of the appellants is upheld in the following words:

Text of the Decision

"When the necessary effect of the legislation is to create inequality of burden as we here see it, are those complaining of the injustice to receive no other answer than that, while the Constitution promises them equality in the matter of taxation, because it failed to place restriction upon the Legislature's right to distribute the tax it collects therefore the purpose of the legislation is not to be inquired into? If constitutional requirements are to be circumvented by such simple and easy process of reasoning, the question may yet be asked derisively of the Constitution, 'What is all this worth?'"

While the case against the Alden Coal Co. only involved the collection of less than $8,000, it was purely a test case involving almost $10,000,000, which represented the tax on coal under the act of 1913 up to July 1, 1915, when a new act passed by the Legislature the past summer became effective.

The suit was brought to test the constitutionality of the act and resulted in Judge Kunkel of the Common Pleas Court of Dauphin County declaring in favor of the act. It was the appeal against this decision that has just now resulted in the reversal of the opinion of the lower court.

Basis of the Defence

The attorneys for the coal interests declared from the very inception of the law that it was special legislation. They based their contention on the fact that while anthracite coal was mined in only nine counties of the state, a proportion of the whole tax was to be distributed in such a way to those nine counties that the cities, boroughs and townships in those counties would share in the distribution, even though no coal was produced in a number of the cities, boroughs and townships. This contention has now been upheld by the Supreme Court, from which there is no appeal to any other court, not even to the United States Supreme Court, which usually at some time or other gets the coal cases. This is for the reason that the present case was brought to test the validity of a state law involving a purely state transaction.

It is well to note at this time that the State Legislature of Pennsylvania passed a new anthracite tax law at its session of 1915, and the present court decision only covers the levying of the tax under the old act of 1913, the new law becoming effective with July 1 of the present year. While this present decision cannot directly affect the act of 1915, it is practically certain that it will now get its day in court. The chances are that it will follow in the way of its predecessor, as the only difference between the two was in the matter of readjusting the proportion to be received by the state and the coal-producing counties.

It is also interesting to note that at no time during the progress of the present suit was the right of the state to levy such a tax on coal of any kind questioned. The suit was practically fought on technical grounds as relating to its accordance with the Constitution.

It hardly need be mentioned that if the act of 1915 is also declared unlawful the next legislature will take steps for the enactment of a law that will comply exactly with the ruling of the Supreme Court. So it can be seen that the coal man's respite may not be a very long one.

Refunds to the Dealers

Probably the most interesting phase of the decision will develop when the retail dealers and large consumers begin to ask the producing companies for a refund of the increased price or tax which they have had to pay for coal from June 28, 1913, until July 1, 1915.

At the time the law was announced as becoming effective some of the operating companies, such as the Philadelphia & Reading Coal and Iron Co. simply issued a price circular showing the prices at the mines and then added a note to the effect that prices would be subject to the Pennsylvania state tax of 2½ per cent. on the mine price. Other companies, however, such as the Lehigh Valley Coal Sales Co. and the Lehigh Coal and Navigation Co., simply calculated the tax into their circular prices. In this latter case these companies would have been actually paying tax on their tax, for the reason that the circular prices were the prices for the coal at the mines and it was on the mines price that the tax was to have been collected.

Those dealers who bought their coal from the companies that added the tax as a separate item will at least have no difficulty in making up and presenting their claims, as on all the bills rendered by the companies adopting the first-named plan the tax was always shown as a separate item.

But the still greater question arises, Will the companies all refund to the retail dealers? And if some should be inclined to the contrary, is there any way to compel them, especially those companies that sold at a lump price with no specific mention being made of the tax as a separate item? The retail men certainly expect a refund. Of course there are any number of instances, especially among the larger dealers with whom agreements have been made as to an adjustment, but these cases are by no means common.

Consumers Take Action for a Refund

The actual consumer of the coal constitutes still another angle to the problem. In Philadelphia, for instance, purchasers of coal from the retail dealers have been paying an advance of 25c. a ton on their coal, which the dealers generally explained was designed to cover the tax and also increased operating expenses. The decision of the court was not a day old before the consumers in this district began to figure on just what amount of money was due them from their dealers, and they at once began clamoring for the refund. The first actual step in this direction was instituted by a coterie of the large consumers in the fashionable Main Line residential section, who have consulted attorneys and are going to make a concerted demand on the dealers for a refund.

Extracts from a Superintendent's Diary

James Lang, an old Scotchman whom I have not seen for about 10 years, drifted into camp today in search of work. Had he known that I was superintendent he would have felt sure of obtaining work because he knew that I must have a warm place in my heart for him (one cannot forget the old fellows who take the trouble to initiate one into the mysteries of practical mining, and the old fellows realize that full well, no matter what kind of old fellows they may be), but he did not know that I was the superintendent—in fact, could not have known that I was superintendent at any camp. When we parted company, I was a mining engineer one year out of college and he was a miner in disgrace because of a clash with a superintendent.

He has apparently never recovered from that stroke of bad luck, while I attribute most of the success that I have had since then to the train of thoughts started by his discharge. I had learned to know him so well, the hard-headed old Scotchman who loved poetry, that I felt that any mining camp could use him to its advantage, and that made me feel that our superintendent was at fault in not knowing how to handle him. My interest was aroused to a point where I could not get the subject off my mind until I decided to my own satisfaction just how the superintendent had blundered.

My friend James was a great admirer of Longfellow, and one line of the poet was on his lips at least once every day—it was the line from the "Psalm of Life" that admonishes men to be not like dumb driven cattle. His interpretation of that line caused the final break with his boss.

Our superintendent could not understand why miners had occasion to gather continually and discuss things of common interest, and he was forever trying to discourage such meetings and made no secret about his opposition to them. At first the meetings had been rather informal and really did not mean much to the men, but when the men began to realize the attitude of the boss toward their gatherings, they began to make them count for something. James Lang was a pretty fair talker to say the least, and spurred on by the idea that he was being classed as a dumb beast, he made his oratorical powers felt. The superintendent could not distinguish between a philosopher and an agitator, and the philosopher soon became a full-fledged agitator, and as a result was asked to leave.

About the same time one of the neighboring camps had a strike, called because the superintendent was opposed to the miners having a checkweighman, and the strike was continued until the superintendent backed down. After that the miners at that camp lost interest in the checkweighman issue and before long could not get a majority of the men out when it came time to elect a new one.

These things happened a number of years ago; but in judging of recent events that have occurred all around our camp, it would appear that human nature has not changed very much since then after all, and men are just as anxious now to do things just because some one wills differently as they were then.

I find that James Lang is still repeating the "Psalm of Life" on the slightest provocation, but he has still not learned its true meaning; and try as I might I was not able to recall those old days to his mind in a manner to gladden his spirits. I have not lost hope, however, and if the wanderlust does not again get control of him too soon, I feel that I will have a chance to repay in part the debt I owe him.

Revision of Mining Laws

A convention that will act on recommendations regarding a general revision of the Federal mining laws will meet in Washington, D. C., Dec. 16. Some of the resolutions that will come before the convention will recommend the fixing of a reasonable term of years beyond which placer claims shall be immune from attack on the ground of fraud, full privilege of appeal in all cases of contests over locations, recording of notices of mining locations so as to insure public notice, the abolishment of the law of apex and the appointment of a Government commission under an act of Congress to investigate and to make recommendations as a basis for the revision of the mining law.

All the known mining societies in the United States have been asked to send delegates, and it is the intention that the mining industry will be so well represented that the action of the convention will be regarded as expressing the wishes of the industry.

COMING MEETINGS

Illinois Mining Institute will hold its annual meeting on Nov. 20, 1915, at Springfield, Ill. Election of officers will be held and the day will end with a banquet.

The winter meeting of the Kentucky Mining Institute will be held this year at Lexington, Ky., on Friday and Saturday, Dec. 3 and 4, 1915. The program is not yet completed. The following committees have been announced. Committee on papers: J. E. Butler, Stearns, Ky., and Ivan P. Tashof, Lexington, Ky. Committee on entertainment: Professor C. J. Norwood, Edwin L. Quarles, R. D. Quickel, Milton Sanchez and Ivan P. Tashof.

The Labor Situation

SYNOPSIS—Frank P. Walsh will act as attorney for Alexander Howat, president of District 14, in suits against J. H. Hazen. President White appoints the officials for District 21.

Some time ago it was alleged that in making the contract between miners and operators in District No. 14 in 1910 and 1912 a large amount of money was raised by the latter and it was suggested that Alexander Howat, the president of that district, and Fred W. Holt, the secretary-treasurer, received about $20,000 of it.

The operators in question formed the Southwestern Coal Operators' Association, and they are alleged to have assembled a fund of $100,000 by assessing the members of that organization. Charles S. Keith and James Elliott were at different times at the head of the association. Franklin Bache was at one time a member, but he left the organization and brought suit against Charles S. Keith for an accounting. In reply Keith declared in court that he had been informed by a detective of the name of Holmes employed by the association that contracts could not be made unless money was used.

Union Officials Said to Have Received $11,250

According to Keith's testimony, it appeared that the detective quoted Alexander Howat's remark that Thomas Lewis and John Mitchell had received money to make contracts and that he proposed to get his before he would arrange for a settlement. Consequently, according to the same testimony, Keith transferred the sum of $11,250 to Joseph H. Hazen to procure the signing of the contract. Under the terms of the arrangement $100 per month was to be turned over to Hazen for another purpose. Keith likewise testified that Hazen told him that he divided the $11,250 between Howat and Holt and that the $100 per month was paid to Howat during the time the contract remained in force.

It is clear that this testimony severely compromised Howat and Holt and the whole United Mine Workers of America, and Alexander Howat himself wrote to John P. White asking for an investigation on Mar. 29, 1914, just at the time that the head of the organization was busied with the making of the biennial agreement. J. P. White, in order to clear the air, required Howat to bring action for slander against those who had made these statements. This action recalls one by John Mitchell when Mother Jones was accused of certain nefarious crimes. He told her to defend her reputation or sever her connection with the union, and as a result she for a long time did the latter. In both cases the persons accused were offered the free services of an attorney to enable them to prove their case.

Of course Keith, in giving his testimony, was defending himself. He was not trying to defame the union, and consequently it would be hard to make a successful charge of slander against Keith. Hazen, however, is thought to be open to a suit, though he himself was testifying in defense of Keith and on the order of the court. The ground for trying Hazen rests on the statements of Keith, Jenkins, Hardin and others to the effect that Hazen declared that he had given the money to Howat and Holt. Even if this was untrue, it was hardly a slanderous statement, for he apparently said it, not for the malicious purpose of hurting those union leaders, but in explanation of what he did with his money.

Hazen's Courtesies Are Thought to Indicate Graft

The attorney appointed by the organization was N. E. Kendall, of Albia, Iowa. He went over the matter with his client, Alexander Howat, and pointed out to him as in duty bound the weakness of his case against Hazen. It seemed to him as he stated later, Oct. 26, 1915, that the case was in some ways quite weak, just as has been explained; but it seemed that there was a further difficulty, and that arose from the evidence of a long-continued friendship between Hazen and Holt. They had been out together to lunches and dinners and on automobile rides and had finally gone to Chicago to see a ball game. It is unfortunate that representatives of labor and capital when they meet must shout their terms to one another from behind trenches. If they exhibit any friendship, both sides and even juries believe that there is some crooked deal in progress.

It is easy to imagine the feelings of Howat when his lawyer told him he had no case. Innocent or guilty, he may have believed that Kendall was no man to conduct his business. He chose J. I. Sheppard, of Fort Scott, Kan., and that attorney refused to have Kendall or anyone else whom the organization might appoint, as an associate in the case. J. I. Sheppard, in his statement on Oct. 26, declared that Kendall's appointment as attorney, or the naming of him or anyone else to interfere with Sheppard's conduct of the case, was a "frame-up" of the organization. In fact, Sheppard looks upon everything in that ungenerous light. He says that the case between Bache and Keith was nothing else, though every evidence is that it was the outcome of some of the bitterest feeling. As an evidence of the artificial character of the proceedings against Keith, Sheppard showed a certified copy of the dismissal of the suit Sept. 26 of this year.

J. P. White Submits Three Separate Plans to Howat

White advised Howat to resign. Howat did so, but attempted to run again for the office, and White opposed the placing of his name on the ballot. A conference was called for Oct. 26 to which the public was admitted. White, Kendall, Sheppard and Howat all discussed this issue, and then White made his proposition. He would appoint Frank P. Walsh as sole attorney if Howat would accept him or he would leave the selection to the four district presidents of the United Mine Workers, or if Howat was ill-disposed to the "capitalistic courts," then White would be willing to see the matter settled in the "courts of our own organization, the international convention which convenes at Indianapolis, Ind., on the third Tuesday in January, 1916."

Ultimately an agreement was signed by which White permitted Howat's name to go on the ballot; Howat accepted Walsh as sole counsel; and White conceded that Walsh should accept Sheppard's services if he desired and that Walsh should be paid by the international organization.

White Takes Complete Charge of District 21

But Kansas is not the only section where there has been confusion. President White has had to take charge of District 21 in Oklahoma, where there is serious internal trouble. The State Mine Workers' Convention at McAlister, Okla., approved his suggestion that he take charge. He has designated the following officers to act for him until relieved by their successors, who are to be chosen at an election to be held within 45 days: President, William Dalrymple, Coalgate, Okla.; vice-president, J. B. Winters, Montana, Ark.; secretary-treasurer, Herbert B. Long, McCurtain, Okla.; executive board: Edward Cunningham, Bridgeport, Tex.; Thomas Sexton, Jenny Lind, Ark.; Ira Decker, Bryant, Okla.; P. R. Stewart, Hartford, Ark. It is understood that none of these men will be candidates for reëlection. The auditors and members of the joint board of the district will remain in office by general consent till after their successors are appointed.

Illinois Miners Drive Militiamen from Mines

Warrants have been issued against Walter Abrams, George Karns and Festus Haley, pit committee in a Hillsboro mine in Illinois, charging them with interfering with workmen because they belong to the militia. The complaining witnesses are Charles Carter, Charles Hill, James Knox, Kieth Hudspeth and James Dugan. When they returned from a state encampment of the militia, the committee refused to allow them to return to work, and charges were preferred against them in the local union and they were suspended. On the advice of Adjutant-General Frank S. Nixon, the men made application for reinstatement, but their request was tabled. The law provides a penalty of $500 for interfering with or discharging a workman because he belongs to the militia. A test case is to be made by the National Guard officers.

Report of Relief in the Hocking Valley District

A report has been filed with Governor Willis relative to the relief work in the Hocking Valley District of Ohio. In it Col. Edward C. Bryan, assistant adjutant-general, states what the department has done to aid the miners and their families. In all, 12,764 persons were assisted and 17 carloads of food supplies were sent to the district for distribution.

In addition there were 30 miscellaneous shipments of supplies. The food was distributed from commissaries established at Nelsonville, Chauncey, Poston, Congo, Orbiston, Glouster and Lathrop. The financial statement of Colonel Bryan shows that the sum of $13,142.54 was spent for food, the Cleveland chamber of commerce donating $1,000.

Editorials

Anthracite Miners' Demands

It is quite probable that when the time comes to discuss the proposed change of wage in the anthracite region someone will industriously dig up the average cost for mined and washery coal in 1909 as given in the United States Census Report—namely, $1.34 per long ton—and then calculate what a 20-per cent. increase on that figure would mean. He will advance the argument that a 27c. increase in the price of coal will provide the companies mining anthracite with all the return necessary to make the needed increase to their men.

But first of all it must be remembered that the demands are not limited to a simple increase in wage. The day laborers are asking for an 8-hr. day, and *Coal Age* hopes they will get it. But this is quite likely to result in an increased cost. It may be possible to hope that the men will speed up the work and put all the work in eight hours that has been strung into nine hours or more, but it is easier to hope this than it will be to secure it.

In the miners' demands there is no promise of that kind. Unfortunately there is only a surly, "We demand," and there is no evidence that with it is combined the promise, "We concede that we ought to do a full day's work in eight hours." If it can't be done, then surely the operator has a right to ask a further concession from the public for the time lost—a concession which must be figured on the domestic sizes and not on the coal as a whole, just as must be the increase in the ton price and in the day-wage rates.

Nor in regarding the problem must we forget the new demand for extra pay for overtime and holiday work. Consideration of both these is unfortunately necessary, for much work has to be done when the mines are idle by men who normally are employed during the day. In fact, inducing the operator to do much of his repairing and construction wholly during specified hours is to make it only more certain that the regular day labor will be interfered with, making it less possible than before to do the day's work in the time formerly devoted to it and still less feasible to do it in the shorter time provided in the schedule. It will also tend to interfere with the miner and make it harder for him to put out his daily quota. However, this is less important, as the present output certainly does not represent his full ability to produce coal. And yet it must be conceded that this interference is important to the miner, for he will often go home rather than wait till the difficulties delaying his work are adjusted.

These two items—greater cost of overtime and shorter hours of day labor—must be remembered in weighing the increase in cost of coal, and the figuring on them is left to the last because they are somewhat elusive and not at all because they have no legitimate weight. The two demands are important and might with some of the companies be found to involve an increase of 20 per cent. in day wages in addition to that directly demanded.

It will apply of course to the day workers only. But it must be remembered that the day men, though not as well paid as the miners, constitute a large percentage of the gross number of workingmen in the anthracite region. One-third of the men employed by the anthracite operators are day hands. Roughly each working unit—miner and mine laborer—makes necessary the services of one day hand.

Since the Census Report of 1909 the wage agreement of 1912 has secured for the miners an increase of 10 per cent., but the sliding scale established in 1902 after the great strike was by consent abolished. This sliding scale was 4½ per cent. higher than the basing rate, so that the increase in 1912 was only equivalent to a raise of 5½ per cent. This would make the labor cost of producing anthracite at the present time $1.37 per ton.

An advance of 20 per cent. would mean therefore an increase of 27.4c. per ton, which on the production of 81,000,000 long tons in 1914 would amount to nearly $22,000,000. But of this total production approximately 8,500,000 tons was used in the operation of the mines and about 19,000,000 consisted of buckwheat, rice and barley, sizes which were sold in competition with bituminous coal. The price at which these steam sizes of coal are sold cannot be advanced unless the bituminous competitors are obliged to make a like concession, so all the adjustment must be on the prepared sizes. Steam sizes find competitors in the bituminous coal output of the country, but the domestic trade in anthracite is faced only with the far less important competition of coke.

As the prepared sizes amounted to only about 53,000,000 tons in 1913 the increased cost of $22,000,000 must be spread over that tonnage, thus adding 41.5c. instead of 27.4c. per ton to the selling price. As stated, however, a third of the men are asking for a rate which might be equivalent to another 20 per cent., and if every demand were granted, an increase of 57c. per ton might be necessary to satisfy the demands of the miners.

But in all this calculation the item of salaries has been overlooked, and indications are not wanting that the men who are paid by the month will expect an increase of remuneration. Some in the past have regarded themselves as subject to the increases in wages granted in wage adjustments and have demanded increased pay through the Anthracite Commission. It must be remembered that "salaries" in the census returns "includes all payments to officials, superintendents, managers and salaried employees in general offices, as well as the payments to salaried employees at the mines." So, clearly the 6.33c. per ton for this item would add $5,127,300 to the bill. Spread over 53,000,000 tons of prepared sizes, the additional cost will be 9.6c. per ton. Consequently we may find that about 67c. and not 27.4c. is the correct answer to the momentous question, "How can the mine workers' demands be satisfied by a rise in the selling price of anthracite?" And it is fair to ask if the public is willing to pay the rise in price thus involved.

Why Set the Living Wage?

A certain brilliant German ophthalmologist, Von Helmholtz, declared that if a normal human eye were sent to him by an optician he would be disposed to return it because of its obvious defects. As a matter of fact, eyes, even the best of them, are not perfect. All of them have a dark spot, a certain degree of astigmatism, a limited range of focus, chromatic aberration and other faults, and doubtless Von Helmholtz would advise that eyes would be more effective if put farther apart so as to increase the breadth of view of objects seen at a near range.

But Von Helmholtz's remarks relative to a model eye have attracted little attention. Eyes are as we find them, defective or otherwise. We may imagine other eyes with greater powers of accommodation, with a spotless retina, without any astigmatic imperfection, but such visions serve no useful purpose. We are face to face with conditions as we find them.

The living wage is an abstraction like the perfect eye. What we mean by a living wage is not the minimum with which it is possible to hold mind, body and soul together, but a wage promising the recipient a certain degree of comfort for himself and his family. No one will doubt he can in some manner live on less. In fact the living wage proposed by the investigators would provide a certain more or less perfect condition of affairs and rebuild the world, just as Von Helmholtz would remodel the eye. But we are face to face with economic conditions in the one case, just as we are confronted with the eye of biology in the other.

Is there economic room for every individual to enjoy that particular "living" wage which happens to be popular (for even the advocates of this manner of determination admit that the standard varies not only with the cost of necessaries, but with the nature and quality of the necessities included in the bill of particulars)? That is the really important question—not What do we want? nor What do we think is desirable? but What conditions actually exist? We live in a plain workaday world in which ideals must always be circumscribed by realities.

Something must be put aside year by year to provide new capital, but if everyone obtained an approach to the living wage advocated, it is certain that not only would there be nothing added to the national resources, but year by year these would be depleted.

What is needed is a general increase of efficiency, both in the work done per day and in the number of days worked. Neither employer nor employee is doing his full part to secure that end. When it is done, the living wage proposed will be readily secured, because the wealth of the world will be able to satisfy it. But meantime a new living wage scale will be elaborated behind which the provisions of our economic status will continue to lag. Quite obviously does our living wage change. No one will deny that an investigator would arrive at a much larger figure if he were determining the cost of living for Americans than if he were assessing it for Bulgarians, for instance, even if prices in both countries were the same.

Wages must be regulated always by the output of labor and by the amount of that labor that we desire to have fixed annually as capital, and they can never be wholly determined on the basis of our wishes or imagined needs. The individual economic status is, like the human stature, not to be modified by our wishes or our fears.

May Change Anthracite Sizes

At last a movement which promises to afford a long-needed relief to anthracite coal buyers and dealers and the transporting lines, as well as a reduction in preparation costs to the producers, seems to have assumed definite proportions. This movement is one established to readjust in a radical manner the now too-numerous hard-coal sizes.

According to rumor, conversations between operating companies have so far progressed that it has been determined that the change in sizes is not only feasible, but that it will conform with the needs of consumers. Certain sizes have been in such great demand in some seasons that the production has not been in any way adequate to the filling of the orders, and it will therefore not surprise the selling public if a change should be made at any time.

So far only the operating officials of the anthracite industry have discussed the matter, and naturally these men lay particular stress on the simplification in preparation methods and equipment which will follow the new schedule of sizes if adopted. It is expected that the selling companies and agencies will soon be consulted and that they in turn will "converse" with the buyers and dealers to ascertain how the idea will strike them and their public.

The second party at interest in the proposed change would be the transportation lines, which are now too frequently congested in their efforts to move trains containing cars laden with eight different sizes. For these different cars have to be dropped at various stations or dumped at the piers in a very different order from that in which the train is made up. In making up trains alone, much valuable time would be saved the roads and ultimately the coal buyer by a reduction of the number of sizes.

The coal dealers will be the chief gainers, because where they now must in most instances stock eight sizes of anthracite coal or more, some smithing coal and a couple of other hard or soft fuels, the anthracite sizes they would carry in the proposed plan would be only four. These sizes, too, would more nearly fit the consumer's requirements, and a slight reduction in prices on some sizes and no anticipated advances should make the movement popular with all buyers.

Tentative plans embrace the adjusting of broken and egg sizes into one, to be known perhaps as furnace; stove coal to remain as at present, but probably to be called small furnace or large range; chestnut and pea coal might be combined into a uniform size that could be called range; buckwheat No. 1 should remain unchanged, on account of its being known as the poor man's fuel in some sections and the economical man's coal in other places; rice and barley coal may be mixed as steam coal. It is also added, as the propaganda goes around, that the operators can further economize in their own fuel consumption by using pulverized culm, as is done at the Hauto plant of the Lehigh Coal and Navigation Co.

Economy all the way down the line is the sole purpose of the whole plan—for the producer, carrier, buyer, dealer and consumer. Thus far it must be remembered, however, that, in the language customary to the daily press, the affair has not progressed beyond the conversational stage, though it is to be hoped that action will result.

Sociological Department

Annual Fete Day at Ellsworth

By R. Dawson Hall

SYNOPSIS—Ellsworth's great annual festivity is not exactly duplicated anywhere else in the country. In no other coal-mining town are all the social activities so skillfully coördinated. The pupils at the school, the foreigners in the folk dances and the miners in their first-aid drill all regard the day as their own.

The fête day at Ellsworth officially goes by the title of the Annual Mine Safety Demonstration of the Ellsworth Collieries Co., but it is badly named for several reasons, for it is now by no means merely a mine-safety meet such as we are all acquainted with and have seen almost at every place where there are coal mines. Then again the Ellsworth Collieries Co. can hardly claim it, for it seems to be the private and exclusive property, not only of the managers of that company, but of every child in the Ellsworth schools. Many of the scholars too young to know the name of the beneficent company providing the fête day and even unable to recognize the men in charge of the festivity nevertheless will look forward to its recurrence and will recall the day with pleasure.

THE POINT OF VIEW FROM WHICH THE ELLSWORTH CHILDREN REGARD THE COAL-MINING PLANT

The company has so far succeeded in making the work so popular that its own action seems to fall naturally into the background. This was only the fourth annual fête day, but already there is hardly any room now for further development and improvement within the limits of a single day.

The demonstrations may have originally been instituted to press forward the first-aid idea, but the sociological superintendent is a teacher and not a doctor, and he has consistently brought forward the educational features and done it most successfully, for he has all those qualities which made Froebel and Pestalozzi so useful to their fellow men.

After all, if we get safety in the mines we will arrive at it largely by education and by inducing everyone from the child to the full-grown man to contribute his mite to that end. Furthermore, safety is only first at best and not the sole end of life. There is still room for happiness and intelligence as an aim of living, and in Ellsworth and Cokeburg, these good things are being sought and the way in which they can be attained is being illustrated.

Kindergartens, Night Schools and Manual Training

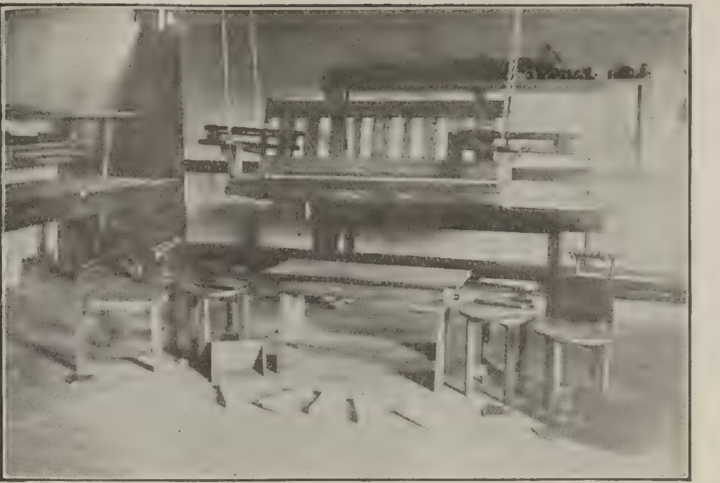
At 10:17 o'clock the train arrived from Pittsburgh with the special car containing the mine officials and the guests of both sexes. This was followed by an inspection of the Ellsworth school, an institution which is remarkably well organized. E. E. Bach is the superintendent of both the Ellsworth and Cokeburg schools. J. W. Sprouls is principal of the former school, and he has two male and seven lady assistants in the regular school work. At Cokeburg, a town about 3 miles from Ellsworth, the principal is E. C. Snyder, and he is aided by five lady assistants.

But despite the excellence of these provisions for the children there would be nothing remarkable were it not for the work of the special departments and the night school. In the daylight schools Margaret Mooney teaches household arts; George C. Donson, shop work; Edith McComb and Edith Blythe are instructors in the kindergarten. The playground is supervised by the household-arts director, Miss Mooney, and the two kindergarten instructors, Misses McComb and Blythe. Dr. G. H. Smith, with Alberta Campbell, takes care of oral hygiene.

The night school has the following instructors: Mining technology, M. D. Cooper; mining law, D. E. Smith; English for foreigners, John Docktor; household art, Margaret Mooney; stenography and typewriting, Dora Little; shop work, George C. Donson; common branches, E. E. Bowman, and English for foreign women, Ethel Cablk. In the continuation school Ethel Cablk has a class in sewing and fitting.

The scholars were not given a holiday in the early morning of the fête day, so the pupils in the kindergarten were playing at rolling ball and the older scholars sang their songs when the visitors passed through the schools.

OFFICIALS' CLUB ROOM, WHERE LUNCHEON WAS SERVED BY HOUSEHOLD-ARTS CLASS



MANUAL-TRAINING ROOM. WHEN VISITED IT WAS CROWDED WITH PUPILS HARD AT WORK

This was followed by the fire drill down the excellently ample fire stairway in the rear of the building. As the hill slopes up behind the school, the distance from the upper rooms to the ground is much reduced. School in Ellsworth seems to have lost all its terrors for the small folk.

After the inspection of the school proper the visitors went to the dancing platform, where the Slovaks, Russians and Italians danced their folk dances in native costume. These gay garments with their amazing embroidery were brought over by the dancers from the countries of their origin, and they were much admired by the ladies. So anxious was everyone to view the costumes that the carefully arranged program almost suffered from the delay.

A PANORAMIC VIEW OF THE FIELD WITH THE OFFICE BUILDING IN REAR

AMERICUS PARDINI'S ADULT BAND PLAYING DURING THE LUNCH HOUR

After the dances a visit was paid to the manual-training department, where several young men were hard at work making furniture. On exhibition were swings, towel rollers, tables, benches, stools, tabourets with woven tops, tooth-brush racks, bench hooks for sawing and shoulders for ironing sleeves—all made and well made by the pupils. The work would stand the most minute inspection. On the walls were industrial exhibits of various kinds, but mostly electrical, such as fuses, carbons and storage-battery parts. The guests also viewed the wonderful needlework and embroidery, much of it done by the foreign women.

Then followed the dinner prepared and served by the domestic science class of the Ellsworth-Cokeburg schools,

the materials used being products of the Ellsworth farms. The menu was as follows: Consommé and croutons, fried spring chicken, buttered beans, escalloped potatoes, veal croquettes, Parker House rolls, nut bread, stuffed-tomato salad, marguerites, ice cream, cakes, mints, salted nuts and coffee.

Admirable Music from Two Large Local Bands

And then there were the bands. It is customary to applaud them and say they are the best in the state. There are so many of these best bands that it is easy to lose count of them. But the Ellsworth bands are certainly wonders and reflect remarkable credit on Americus Pardini, the director. There are two bands, one of boys and one of men, both large organizations nattily uniformed in white and both most capable aggregations. A barytone solo was rendered by Vincent Sikora. Miss Olive Painter sang a solo and with J. H. Hamilton a duet. M. F. Angotti played a cornet solo. As a background for this duet and these solos, several classical pieces were played by the bands.

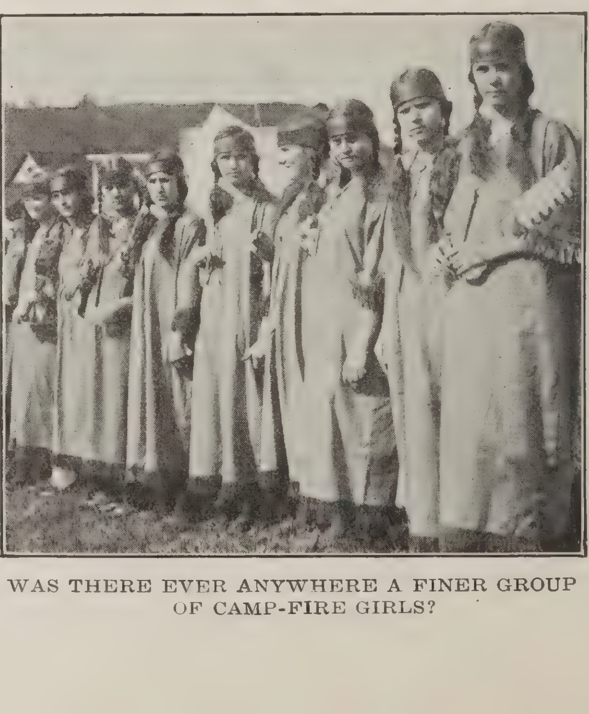
The mine-safety demonstration was preceded by the grand march of the children from the Ellsworth and Cokeburg schools, each holding a tiny flag. Perhaps nothing else was more appreciated by the spectators than this little flock of humanity in gala attire and so full of life and excitement that decorous marching was out of the question. The expression "dance past" the grandstand would better fill the bill than the more usual "march past" by which it is usually described or "straggle past" as it is too often in reality. There was a special grandstand provided for these children.

After the children were duly settled and presented with edibles to stay them during the contest, the first-aid men lined up in three rows, each containing 15 teams of 6 men, or 270 men in all. The front rank was taken by the teams of mine No. 1. Back of it were ranged those of mine No. 2, and farther back the teams of mine No. 3. Each group of teams performed a separate problem, and when the judging had been done the patients were removed on stretchers so that room was left for the teams behind to come forward and perform their event.

One Hundred Trained Men at Each Mine

The Ellsworth Collieries Co. does not employ a vast number of men. At its three mines it has 347, 398 and 359 men respectively. Now 90 trained men from a mine means a wonderful percentage and shows how first-aid work has been spread. But in addition there is a mine-rescue team at each mine and an ambulance squad, so instead of 90 trained men at every operation there are an even 100. The percentages of men prepared to aid

THE CHILDREN DIVIDED THEIR ATTENTION IMPARTIALLY BETWEEN THE EDIBLES AND THE EXHIBITION



WAS THERE EVER ANYWHERE A FINER GROUP OF CAMP-FIRE GIRLS?

in times of accident are 29, 25 and 28 per cent. respectively.

The sociological director is endeavoring to get everyone interested. Even the long-bearded Russians have at last been induced to take part. They are perhaps still a little crude and disposed to perform their work with more slapdash than such delicate operations require. But time and experience will cure this as all other things, and in the long run the Russians will learn that the manner of operation is as important as the work to be done and that giving first aid is not like setting a prop or loading a car of coal.

The scores of all the teams, both in first aid and mine rescue, from any one mine were added, and the mine with the highest score received the company's cup. The judges of the events were all doctors, Dr. D. E. Sable, fire and police surgeon of Pittsburgh, representing the American Red Cross, being in charge. Drs. G. K. Hays, J. W. Allen, L. W. Hoon, G. T. Linn, R. V. Stewart, P. M. Wall and J. G. Warner, from Monongahela; Drs. W. H. Lewis, M. H. Day, from Donora; Drs. J. W. Hunter, V. P. Vieslet, C. B. Hiller, from Charleroi; Dr. L. M. Mitchell, from Belle Vernon; Dr. John Farquahar, from California, and Dr. T. B. Herron, from Monessen, formed the judging staff.

A ROW OF FOLK DANCERS

After the first-aid events a mine-rescue demonstration was held. For this a large gallery had been erected. An explosion was realistically simulated, after which an injured miner was to be rescued. C. G. Brehm, of the Oliver & Snyder Steel Co., and Harry and George Millward, of the Tower Hill-Connellsville Coke Co., were the judges.

The cup was then presented by Congressman H. W. Temple. Red Cross medals will also be awarded to the first-aid team making the highest percentage and Red Cross certificates to the teams making the second and third highest percentage. This will doubtless take a further test, for five teams secured 100 per cent.

After these events lunch was provided for the participants in the demonstration, and a moving picture was run off for the visitors, but unfortunately most of these had to leave early because the hour for the last train had arrived.

The work of the 13 Boy Scouts and 17 Camp Fire girls should not be overlooked. They certainly made the event pass off without a hitch. The girls especially, who gave their attention to the children taking part in the pageant and viewing the contest, proved their value in such events.

Much credit should be given E. A. S. Clarke, the president of the company, and W. A. Luce, the assistant general manager, for the excellent social work being done at Ellsworth under the immediate control of E. E. Bach, the superintendent of sociological work and of the schools.

⁂

First-Aid Car Equipment

The emergency or fire-fighting car of the Philadelphia & Reading Coal and Iron Co. contains the following equipment:

9	Draeger oxygen helmets (company has 43 in all).
1	Fleuss oxygen helmet.
2	chemical fire extinguishers and charging cans.
3	pulmotors (company has 5 in all).
1	inhalator.
1	Johnson & Johnson No. 1 cabinet.
6	electric S. B. searchlights, portable.
10	type-B Hubbell hand lamps.
9	type-H Hubbell hand lamps.
4	type-M Hubbell hand lamps.
1	oxygen pump.
13	oxygen tanks.
	Cots, mattresses, bedding, for camping on the job.
1	Aldrich triplex pump for fire use.
1	8-hp. gas engine.
2,000	ft. 4-in. wrought-iron pipe.
8,125	ft. 2½-in. rubber hose and nozzles.
20	spray pipes.
	Wrenches, hatchets, axes, saws, shovels, hammers, bars, nails and all small tools.
	Stretchers, oiled suits, lanterns, Davy safety lamps, rope, block-and-tackle rigs, 2 wood and 1 iron telephone sets.
9,540	ft. telephone cable, insulated.
1	cook stove.
1	generator set, switches and all accessories.
2	rolls of fireproof brattice and 10 rolls of nonfireproof brattice, 240 yd. in all.

The same company has 1,740 men who have been trained in the wearing of helmets.

⁂

Sociological Notes

The Holy Name Society in Pittston, Penn., in connection with St. John's Roman Catholic Church, has started a class to prepare mine workers for the mine foremen's examinations. The class will meet at the new clubhouse of the society and be instructed by George V. O'Hara, mine foreman of the Pennsylvania Coal Co.

The Miners' Federation at Nottingham, England, on Oct. 7 passed a resolution in favor of the abolition of electrically driven coal-cutting machinery. They also demanded an 8-hr. day for outside men and a minimum wage of 5 shillings, or $1.21, per day for adult workers. A resolution advocating the starting of work at 8 a.m. instead of 6 a.m. was rejected. The British Government was asked to amend the Old-Age Pension Act so as to reduce the age at which pensions were granted to 65 years and to make the pension not less than $1.82 per week.

At Trotter, Continental No. 1, United and Footedale, plants of the H. C. Frick Coke Co., first-aid meets were held on Oct. 7. At Trotter, Davidson, Youngstown and Leisenring No. 2, all scored 97⅓; Coalbrook and Juniata, 96; Leisenring No. 3, 95⅔; Trotter, 95⅓; Rist 92; Adelaide, 92; Leisenring No. 1, 92, and Buckeye, 89⅓. At Continental, Continental No. 1 scored 98; Lemont No. 1 and Continental No. 2 each 96; Kyle, 92; Lemont No. 2 and Oliphant, each 90; Collier, 88; Continental No. 3, 87; York Run, 81; Wynn, 80; Redstone, 79, and Shoaf, 75. At United, Southwest No. 1 scored 100; Standard, 99⅓; United and Calumet, each 98⅓; Brinkerton, 97⅔; Hecla No. 2, 97; Mammoth, 96⅔; Whitney and Hecla No. 1, each 95⅔; Hostetter and Baggaley, each 95; Dorothy, 94⅓; Central, 93⅔; Hecla No. 3, 41⅓; Marguerite, 90⅓. At Footedale, Colonial No. 4 scored 98; Edenborn, 96⅓; Buffington, 95⅔; Colonial No. 1, 94⅓; Gates, 94; Ronco, 93; Leckrone and Lambert, each 91½; Footedale, 90; Filbert, 88⅔; Colonial No. 7, 87; Bridgeport, 86⅔, and Dearth, 73⅓. The three events submitted at each of the four plants were identical, so that the ratings are strictly comparable, and Southwest No. 1, the only team with a perfect score, may be acclaimed the winner.

Discussion by Readers

Store Checks vs. Thrift

Letter No. 1—I was glad to see the Foreword in *Coal Age,* Oct. 16, p. 619, drawing attention to the evils of the store-check system. I have no objection to a properly conducted company store, which is an absolute necessity in many communities removed from a town.

In the conduct of such a store, however, it should be recognized as a good business principle that every outlay of capital is entitled to a fair return on its investment. Too often has the company store played a dual part and been required not only to make a profit on its capitalization, but to carry the burden of other departments of a coal-mining company by making good the losses sustained in those departments. When the company store is thus used as a support for the operating end or for the sales department of the mine, its profits can hardly be said to be legitimate. Every branch of the company's business should be made to carry its own burdens.

When the profits of a store are made to cover operating expenses, it means that the miner who produces the coal is taxed to help the consumer pay for its use. The miner does this by the high prices he is obliged to pay for his goods at the store. While such practice may not be dishonest, it is certainly questionable.

The Loan-Shark Evil

Another objection to the store-check system is the opportunity that it affords the speculator, who takes advantage of the necessity of the one holding the checks and redeems them for cash at a large discount. This practice is similar to what is known as the "loan-shark evil," since it robs the laborer of a good percentage of his hard-earned wages. Checks so redeemed are presented on payday, and the speculator receives the full amount of cash that they represent, in return for the money he kindly (?) advanced. I have known of clerks in the offices of coal companies who made more each month by such practices than the amount of their salary. Where the bookkeeper is also the paymaster, as often happens, the transaction is a simple and easy one. Too often these checks are redeemed at the saloon, whereby the bartender makes a double profit by the discount on the checks and the sale of his liquor.

Another Aspect of the Case

Both the store-check system and an unlimited credit on the store books are a source of evil and not only throw a burden on the man himself, who takes advantage of the system to run in debt to the store, but on his coworkers in the mine, who suffer as a result, and the company is likewise a loser in the end.

The system operates as follows: The man who runs up a high bill at the store or overdraws his account often succeeds in getting the best places in the mine where he can make the most money. He is generally wise to this fact. The foreman is notified of the man's indebtedness, and to assist in squaring the debt, that man is shifted to a place where he can make more money, while the thrifty man who pays his bills regularly each month must take anything he can get, his name remaining on the waiting list.

In such mines one often finds a half-dozen incompetent men doing the work that could be accomplished by four or five men who are experienced in the work. In like manner the man in debt at the store is likely to be the one called on for extra work, nights and Sundays, or he is kept on the payroll during periods when the mine is idle and often to the exclusion of better men.

It may not be the intention of the company to show favoritism, but where credit is extended at the store to employees, it is only natural that the company should wish to square the accounts by every means in its power. Such practices, in effect, place a premium on incompetence and improvidence, since the men are not slow to avail themselves of the advantage thus afforded them. This condition is generally avoided where an agreement exists between the miners and operators, because the contract is so worded as to provide equal treatment for all employees.

Comparison of Workers

A simple comparison of the thrifty man with the hand-to-mouth or improvident man shows that, while the former is a creditor, the latter is always a debtor. The one has learned that his welfare depends on efficient and conscientious work—he believes in giving an honest day's work for an honest day's pay. On the other hand the improvident man believes that more is to be gained by keeping in his employer's debt. He systematically neglects his work, which is below par. He counts on his indebtedness to the company as his best protection. It is clear that a few such men greatly reduce the efficiency of the mine and destroy the morale of the working force. As thrift spells efficiency in a workman, improvidence is invariably synonymous with incompetence of the worker.

What Is the Remedy?

There are probably other evils that will be suggested in the further discussion of this subject. I have mentioned the above as they occurred to me, without much thought of sequence. The chief question, however, is, What is the remedy for these conditions? The first step, no doubt, is the recognition of the evil by operators and employees alike.

There are men who believe the system to be good. They consider that the miner's indebtedness acts as a restraint on the upward tendencies of the cost of living and the downward tendencies of wages. The debtor system, often regarded as a club, is generally wielded with greater effect in favor of the mine worker than of the operator. It is far more to the interest of the latter to promote thrift among employees than to encourage them to run in debt. The aim should be to encourage thrift as a means to more comfortable living rather than attempting to force men by this means to accept hard conditions in the mine.

In my opinion the company store should be run independent of all other operations of the company. The business should be conducted on the same plan as that of an independent merchant. Goods should be sold for which there is the greatest demand. The price should be such as to yield a fair profit only, and miners should not be discriminated against because they may choose to trade elsewhere. Trade should be won by fair dealing.

On the same ground that miners refuse to extend credit to the company by continuing to work if not paid on the regular payday, the store could refuse to extend credit for goods when payment for the same is not promptly made. If the miner finds himself unable to secure unlimited credit, he will soon discover suitable means to provide against any ordinary emergency. Necessity is responsible for many of our virtues, one of which is thrift. GEORGE N. LANTZ.

New Straitsville, Ohio.

Letter No. 2—It is all very well to let one's sympathy run riot as regards store checks or "scrip," especially if that particular one is totally unfamiliar with the practical operation of a coal camp, but the vicious maligning of the "scrip system" is only in keeping with the multitude of erroneous ideas that people, who work above ground, harbor with reference to coal mining in general. Moreover, it is not fair to condemn the evils of a mining camp without pointing out its virtues.

In the first place the practice of "peonage," the abuse of workmen, exorbitant profits, etc., have long been things of the past, and in their place today we have the average coal camp conducted along practical business lines. With the present existing labor conditions, the average coal miner is a free agent in every respect. It is not ill treatment at the hands of coal-mining officials that is spoiling the coal miner of today, but the unmerited sympathy of a vast army of people who have no actual knowledge of the conditions, but are swayed by magazine writers and newspaper reporters. The latter class are either criminally guilty of misrepresentation or irresponsible.

ACTUAL CONDITIONS MISREPRESENTED

The average magazine or newspaper article is usually a joke (if it were not so serious) in the eyes of practical coal-mining men. Nevertheless, it is the popular idea that we are a class of pirates. Popular opinion seemingly does not consider that the days of slavery are gone and that we are subject to scrupulously close investigation by the mining department of the state, the same as are purveyors of groceries and drugs sold under the pure-food law. With work as plentiful as it usually is in this country, an abused workman in any class of labor is not slow to quit his job, particularly a coal miner. But you never hear of a coal miner ever following another profession. Why? Because when he does work, and he usually works only when he pleases (imagine him pulling off that stunt in the average factory!), he earns a larger wage than is paid per day for any other class of labor.

Now the crux of the situation is the fact that these same high wages permit him to work as he pleases and to squander his money during the periods of idleness. The high wages paid to miners are directly responsible for the general clamor for a lower priced fuel. In other words, this shiftless labor is a creature that we coal men have on our hands and for which we are not responsible. Now, are we going to let them starve because they are shiftless? Can we, in this Twentieth Century, reform the world when it has not been done in the ages passed and gone? Were we to refuse to advance some miners money to secure picks, shovels, powder, etc., they could not work. That is one thing that makes scrip a necessity.

Second, their wives and children are waiting to eat until payday arrives. Shall we turn them down and say, We are going to teach you thrift. Quit your kidding! Did you ever cut "scrip"? No. Well I have—thousands and thousands of dollars' worth; and I know that the good it did the women and children *must* be taken into consideration. It is true miners are reckless with scrip. So are they with money. It is the same old story—come easy, go easy. What are we going to do about it? Are we our brother's keeper? We know women and children must eat. Ideas are all right—but to eat is vitally practical. I have scratched my head many a time wondering who was going to foot the bill if I let them eat.

PROFITS OF COMPANY STORES

Now about this store-profit business. In the average coal camp, profits are figured as a certain percentage of the investment, and that is not nearly in keeping with the percentage figured by the ordinary grocer in a city of any size. I have lived in both places and know this to be the fact.

If I abused my workmen any more than any coal operator who may read this article does his, my men would leave me. If I overcharged them for their goods, they would buy elsewhere. If they bought elsewhere or if they left us, our mines would cease to run. Anybody, however badly informed he may be, knows that the coal production of this country is enormous. Politicians are too thick, and we all know that they would make capital of any disgression in the coal business, the same as in any other industry.

Again, the Federal authorities operate a certain department, which makes special reports to the Government in respect to mines, just as they report conditions in regard to hotels and other public utilities. These reports, I have been informed by the officials, are not made public, but the Government has ample access to them.

As regards thrift among our miners—sure, we encourage it all we possibly can; for we realize the value of a steady independent workman, and incidentally, we never have any trouble whatsoever with this class of workmen. They never complain or strike, but they own automobiles and soak money away in the large banks in the various cities that operate foreign departments.

It seems the public in general does not want to know the truth about mining conditions, but would rather read a virulent article written by someone who went through the mining district on a Pullman. G. E. WEBER.

Cincinnati, Ohio.

❖

A Flooded Mine Proposition

Letter No. 1—Referring to the inquiry of Wm. W. Miller, *Coal Age*, Oct. 16, page 646, I will say that the building of a dam, as he stated, across both entries is in my judgment the best thing that could have been done under the circumstances. That work, followed by getting the pumps in place as quickly as possible, was no doubt the means of saving the mine.

I could not approve the idea of building a permanent stopping across the face of room 4 or any of the adjoining rooms. Assuming this could be done and the dam made sufficiently strong to withstand the pressure of the water, it would still be unsafe to work the rooms in that section of the mine, because it would not be known at what moment the water would be tapped again. Of course this means that further work in that block of coal must be stopped or the chance taken of being compelled to build a stopping in every room. Neither could I approve the plan of drilling holes from the surface through which cement grouting could be run into the rooms.

My plan would be to pump all of the water out of the old mine and then have those workings carefully examined by competent miners, in company with the mine manager and mine foreman. My motto is always "Safety First," which means to cut out every possible danger. It is well known that miners are always loath to work in a mine where there is danger of water breaking into the workings. However, seeing this was a drift mine in a flat formation, there is little to be feared in respect to a great water pressure. Had this been a slope or a shaft mine, it would have been a different proposition, and another plan would then have had to be adopted.

Republic, Ala. FIREBOSS.

⁂

Labor in Bituminous Mines

Referring to Geo. S. Brackett's comments in reply to my letter, both of which were published in *The Colliery Engineer,* October, 1915, p. 161, permit me to add a few words in justification of my previous statement criticizing his article on this subject, which also appeared in *The Colliery Engineer* for September, p. 99. In doing this, I do not wish to prolong the argument, but desire to say that I do not think I misunderstood the expression used by Mr. Brackett in his article.

INFLUENCE OF MANAGEMENT TO REDUCE COSTS

Mr. Brackett states plainly, at the beginning of the article, "The management at a mine has comparatively little influence over the mine-supply costs." In reply to this, I want to reiterate my previous statement, "The management at a mine has a very large influence over the mine-supply costs, which can vary 100 per cent. or more according to the care and vigilance exercised in watching that part of the costs." In my opinion the influence of the management is proportionately as great over the total expenditure as over the cost for labor. It is true that, as Mr. Brackett states, the costs for labor are far in excess of the supply costs, but I claim that the local management should exert the same influence over the one as over the other. I admit, of course, that if the percentage of saving is the same in both, the economy effected will be greater in the one case than in the other.

VIGILANCE REQUIRED TO PREVENT WASTE

In his letter, Mr. Brackett says, "Ties or props wasted in old rooms are there to be seen many times before they are finally covered up." While this is true, unless the matter is given special attention, such unused ties and props are not seen and soon become lost to view, being covered with a fall of roof or other waste material. The point I wish to emphasize is that, since these matters can be given attention, the local management is responsible for the influence it is possible to exert on the supply costs.

I might give further examples of the waste of material in mines and the possibilities of eliminating this waste and reducing the cost of production, but every experienced mine manager is already familiar with these points, and I will not enlarge on the items mentioned in my previous letter, which are sufficient to illustrate my contention that strict vigilance is necessary to prevent large leaks in supply costs. In this connection and to further emphasize this claim, I would refer here to Lehman G. Hauger's article on "Practical Economy at Coal Mines," *The Colliery Engineer,* October, 1915, p. 128, and H. H. Warner's article entitled "Handling Mine Supplies," *Coal Age,* Oct. 23, p. 665. EDWARD H. COXE.

Knoxville, Tenn.

⁂

Responsibility of Miners

Letter No. 2—In the letters written for *Coal Age* I have observed many references to the plainly visible changes that are taking place in the attitude of miners toward coal operators. In what I have to say I am not going to enter a protest against labor unions or the organization of miners for their own protection. I do not wish to criticize any effort made to better conditions in mining, either in respect to employer or employed. I believe that labor unions can be made of great benefit, not only to the working classes, but to operators as well, provided they are properly conducted and not permitted to be controlled by a few paid organizers whose constant aim is to stir up trouble among the men.

LABOR UNION METHODS ANALYZED

Too often union officials claim that all members of the union are entitled to weekly benefits when they unite to fight their supposed grievances. They are willing to pay these weekly benefits during a strike; but I would ask, When has a local union ever paid the rent bill or the store bill of one of its members who was in need, during a time when the mine has been closed for lack of orders?

There is a responsibility resting on the miner for his action in supporting, without sufficient cause, any proposition that will throw the mine idle for an extended period. Miners suffer more as a result of these enforced periods of idleness than the coal operators themselves. Compare the attitude of the local unions in this respect with that of many large coal companies. While it is claimed that union miners get more money for their labor and work less time than nonunion miners, it is a fact that many of the larger coal companies are paying their men more than is paid for the same labor in organized mines.

THE H. C. FRICK MINES NOT ORGANIZED

This is true of the H. C. Frick Coke Co. whose mines are unorganized. The men working in these mines never know of an increase in wages till the same is announced and never make a demand for such increase. When business conditions permit, a notice is posted by the company, stating that an advance of 10 per cent. will be made in the pay of all mine workers. This treatment does not correspond with the claim often made by union miners that coal operators maintain a brutal attitude toward their employees. It is to be hoped that mine workers will realize more and more their responsibility in respect to the proper control of their unions.

RESPONSIBILITY OF MINERS WITH RESPECT TO SAFETY

There is another responsibility resting on the miner respecting his attitude toward his own safety and that of his fellow-workers. I have been much interested in reading the letters on "Prevention of Mine Explosions." While many good suggestions have been made, however, it is a fact that such disasters still continue to occur. According to the report made on the Orenda mine explosion of Aug. 31, 1915, the gas was ignited by a spark, in the operation of an electric haulage motor. It would seem that if proper precautions had been adopted in this mine, the ignition of the gas and the resulting explosion would not have occurred.

In other cases a reckless miner enters an abandoned portion of the mine carrying an open light when he knows the place to be dangerous. Another miner handles his lamp carelessly or tampers with it, and in so doing runs the risk of causing an explosion. In most cases the mine foreman employs a number of firebosses and assistant foremen on whom he must depend for the thorough inspection of the mine before permitting the men to enter for work. If one of these men makes a false report or fails to make a thorough inspection of his district, an accident is liable to happen.

RESPONSIBILITY OF THE MANAGEMENT

Besides the responsibility resting on each miner working in the mine, much depends on the safe management of the mine, especially where explosive gases are being generated in pillar workings where it is often difficult to secure thorough ventilation and avoid the accumulation of explosive gases on the falls. It may even be necessary to sink a drillhole from the surface in order to drain the gas from such places. To avoid accidents, it is important to take every precaution with respect to maintaining safe conditions on the haulage roads, the timbering of working places and the blasting of the coal. Shotfirers must be employed in many cases whose duty it is to inspect every shot before firing the same and to refuse to fire any hole that in their judgment is unsafe.

When these responsibilities are fully realized by miners and operators, the number of mine accidents will be greatly reduced.

JOHN MAJER.

Listie, Penn.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

METRIC SYSTEM OF WEIGHTS AND MEASURES

The units of the metric system are the **gram, meter** and **liter.** The system, unlike that of the United States and Great Britain is wholly a **decimal system** and, for that reason, is more convenient for use.

Denominations—The higher denominations of weight, length and capacity are obtained by multiplying each respective unit by 10. 100, 1000, etc., while lower denominations than the unit are likewise obtained by dividing the same by 10, 100 or 1000.

The denominations of the metric system are expressed by the Latin and Greek prefixes, the former being used to indicate divisions of the unit, while the latter are employed to express multiples of the same unit. These prefixes and their respective values are as follows:

Milli,	1/1000	1 milligram (mg.)	= 0.001	gram
Centi,	1/100	1 centigram (cg.)	= 0.01	gram
Deci,	1/10	1 decigram (dg.)	= 0.1	gram
		Unit of Weight	**1**	**gram**
Deca,	10	1 decagram	= 10	grams
Hecto,	100	1 hectogram	= 100	grams
Kilo,	1000	1 kilogram (kg)	= 1000	grams
Myria,	10,000	1 myriagram	= 10,000	grams

The same prefixes are used to express similar divisions and multiples of the units of length and capacity. Area and volume are expressed by the words square and cubic preceding the same denominations of length. Following are the tables of the metric system and equivalents:

METRIC WEIGHT

10 milligrams	= 1 centigram	0.15432356	gr. (troy)
10 centigrams	= 1 decigram	1.54323564	gr.
10 decigrams	= 1 **gram**	15.43235639	gr.
		0.03527396	oz.(avdp.)
10 grams	= 1 decagram	0.35273957	oz.
10 decagrams	= 1 hectogram	3.52739575	oz.
10 hectograms	= 1 kilogram	35.27395746	oz.
		2.20462234	lb.
10 kilograms	= 1 myriagram	22.04622341	lb.
		0.22046223	cwt.
10 myriagrams	= 1 quintal	2.20462234	cwt.
10 quintals	= 1 tonne	1.10231117	tons

The French tonne (2204.6 lb.) differs but slightly from the British long ton (2240 lb.).

METRIC LENGTH

10 millimeters	= 1 centimeter	0.3937	inches
10 centimeters	= 1 decimeter	3.937	inches
10 decimeters	= 1 **meter**	39.37	inches
		3.2808	feet
10 meters	= 1 decameter	32.8083	feet
10 decameters	= 1 hectometer	328.0833	feet
		0.0621	miles
10 hectometers	= 1 kilometer	0.6214	miles

The Coal Age Pocket Book

The Austrian, Prussian, Danish and Norwegian mile is equal to about 4.7 American miles; the Swedish, to about 6⅔ American miles; while the Russian "verst" is 3500 ft.

METRIC AREA

100 sq. millimeters	= 1 sq. centimeter	0.155	sq.in.
100 sq. centimeters	= 1 sq. decimeter	15.500	sq.in.
100 sq. decimeters	= 1 **sq. meter (centare)**	1549.997	sq.in.
		10.764	sq.ft.
100 centares	= 1 sq. decameter (are)	1076.387	sq.ft.
		0.025	acres
100 ares	= 1 sq. hectometer (hectare)	2.471	acres
100 hectares	= 1 sq. kilometer	247.104	acres
		0.386	sq.mi.
100 sq. kilometers	= 1 sq. myriameter	38.610	sq.mi.

The unit of area is the square meter or centare.

METRIC VOLUME

1000 cu. millimeters	= 1 cu. centimeter	0.061	cu.in.
1000 cu. centimeters	= 1 cu. decimeter	61.023	cu.in.
1000 cu. decimeters	= 1 cu. meter	35.314	cu.ft.
		1.308	cu.yd.

The weight of 1 cu. centimeter of distilled water at maximum density (4° C.), weighed in a vacuum, is 1 gram; or 1 cu. decimeter of same under like conditions is 1 kilogram.

METRIC CAPACITY

10 milliliters	= 1 centiliter	0.610	cu.in.
10 centiliters	= 1 deciliter	6.102	cu.in.
10 deciliters	= 1 **liter**	61.023	cu.in.
		0.035	cu.ft.
10 liters	= 1 decaliter (centistere)	0.353	cu.ft.
10 centisteres	= 1 hectoliter (decistere)	3.531	cu.ft.
10 decisteres	= 1 kiloliter (stere)	35.314	cu.ft.
10 steres	= 1 myrialiter (decastere)	353.145	cu.ft

The liter is the unit of capacity in the metric system. Its volume is 1000 cu. centimeters or 1 cu. decimeter. It contains 61.02338189 cu.in., or 0.26417 gal. (winchester). Or a single winchester gallon contains 3.785434 liters.

The Fluid Ounce—What is known as the "fluid ounce" is a quantity of any liquid equal to that of pure water at maximum density (4° C.) and weighing exactly 1 oz. avoirdupois. The volume of the fluid ounce is calculated as follows:

1 cubic centimeter of water (4° C.) = 1 gram.
1 ounce avoirdupois = 437.5 grains.
1 gram = 15.43236 grains.

Hence, since the volume of 1 gram (water) is 1 c.c. and the fluid ounce has a volume based similarly on the avoirdupois ounce, the value of the fluid ounce is

$$\text{Fluid ounce (fl.oz.)}, \quad \frac{437.5}{15.43236} = 28.3495 \, c.c.$$

The **minim** (a drop), the smallest liquid measure, is $^1/_{60}$ of a fluid dram or the equivalent in volume of 1 grain, which is 1 ÷ 15.43236 = 0.0648 c.c.; or 28.3495 ÷ 437.5 = 0.0648 c.c.

Inquiries of General Interest

Engine-Plane Haulage

Will you kindly explain the method of solving a problem pertaining to rope haulage on an incline? The question is as follows:

On a slope pitching 25 deg. and 2,000 ft. long, a trip of eight loaded cars is to be hoisted in 5 min. The weight of the empty cars is 1,500 lb. each and the average capacity 3,500 lb. of coal. What is the actual horsepower of the engine required to haul this loaded trip up the incline, and what size of plow-steel rope will be required in this case, using 5 as a factor of safety? D. J. Bowen.

Lafayette, Colo.

Assuming an engine-plane haulage in which the loaded cars are hauled up the slope, without being counterbalanced by the weight of the descending empty cars, the total load on the winding drum is the combined gravity pull of the loaded cars and the rope, plus the friction pull of the entire moving load, including the rope.

Under fair average conditions in mining practice it is safe to estimate on a track resistance of 40 lb. per ton on a level road. The corresponding track resistance when hauling on an inclination of 25 deg. is $40 \times \cos 25^\circ = 40 \times 0.9 = 36$ lb. per ton. To this must be added the gravity pull per ton due to the inclination. There being 2,000 lb. in a ton, the gravity pull in this case is $2{,}000 \times \sin 25^\circ = 2{,}000 \times 0.4226 =$ say 845 lb. per ton. Therefore in this case the total load on the engine is $845 + 36 = 881$ lb. per ton of moving load, including the rope.

The weight of the loaded trip is $8\ (1{,}500 + 3{,}500) = 40{,}000$ lb., or 20 tons. Then allowing, say, an extra ton for the weight of the rope, for the purpose of estimating the size of rope required, gives a total approximate moving load of 21 tons. The load on the rope at the drum, due to the combined track resistance and gravity pull, is then $881 \times 21 \div 2{,}000 = 9.25$ tons. Now, calling the diameter of the rope d (inches) and the load on the rope L (tons), and using a factor of safety $f = 5$, since the breaking load of a 1-in. six-strand seven-wire plow-steel haulage rope is 42 tons, we have

$$d = \sqrt{\frac{fL}{42}} = \sqrt{\frac{5 \times 9.25}{42}} = 1.05,\ say\ 1\tfrac{1}{8}\ in.$$

This rope weighs 2 lb. per ft., as taken from wire-rope tables, which makes the total weight of the rope on this incline $2{,}000 \times 2 = 4{,}000$ lb., or 2 tons. The total moving load is therefore 22 tons, which makes the load on the rope at the drum $22 \times 881 \div 2{,}000 = 9.69$ tons.

Reversing the previous formula, to find the safe load on a 1⅛-in. plow-steel haulage rope, using a factor of safety $f = 5$, we have

$$L = \frac{42\,d^2}{f} = \frac{42\,(1\tfrac{1}{8})^2}{5} = 10.63\ tons$$

which shows that this rope is amply safe to haul the required load.

The horsepower of the engine required for this hoist is estimated from the load on the engine and the speed of winding. To haul the trip a distance of 2,000 ft. in 5 min. will require a speed of winding $2{,}000 \div 5 = 400$ ft. per min. The required horsepower of the engine, assuming an efficiency of 85 per cent., is therefore

$$H = \frac{9.69 \times 2{,}000 \times 400}{0.85 \times 33{,}000} = 276 + hp.$$

In this calculation, no allowance is made for time lost in starting and stopping the trip. The time of acceleration and deceleration of the loaded trip will depend on the load on the engine and the speed to be attained.

Friction Hoist for Engine Plane

We are installing in our plant a 40-hp. friction hoist to pull a 5-ton loaded car up a 30-deg. incline at a speed of 200 ft. per min. The hoist consists of a 36-in. drum bolted to the spokes of an iron wheel 80 in. in diameter and having a 10-in. face. This wheel and drum are driven by a paper friction pinion 12 in. in diameter, with 10-in. face. This pinion is forced against the driving wheel of the drum with a pressure sufficient to give the desired friction and enable it to transmit the 40 hp. of the engine to the drum. We estimate that the required speed of the drum, which is 3 ft. in diameter, is $200 \div (3 \times 3.1416) =$ say 21 r.p.m. There is, however, considerable difference of opinion as to what speed it will be necessary to run the 12-in. pinion in order to operate the drum at the required speed.

Peoria, Ill. Charles F. Sherman.

It is not customary to employ a friction drive of this type for hoisting on an incline or for the transmission of as high a power as is required in this case.

Assuming a track resistance on the level of 40 lb. per ton gives for the same item on an incline of 30 deg. $40 \times \cos 30$ deg. $= 40 \times 0.866 = 34.6$ lb. per ton. Adding this track resistance to the gravity pull of a 5-ton load on this incline gives 1,034.6 lb. per ton as the total load on the drum. Correspondent does not mention the length of the incline, but a ¾-in. plow-steel rope weighing 0.89 lb. per ft. would be required for this haul, and this may be assumed to add from ¼ to ½ ton, making the load hoisted, say, 5.5 tons. The total load on the drum is then $1{,}034.6 \times 5.5 = 5{,}690$ lb.

The diameter of the large wheel being 80 in. and that of the drum 36 in., the load at the circumference of the large wheel is $5{,}690 \times 36 \div 80 = 2{,}560$ lb. Assuming a coefficient of friction between the two wheels as 0.25, it would be necessary to exert a pressure of about 5 tons in forcing the pinion against the face of the large wheel in order to hold this load and prevent slipping of the pinion. We cannot recommend this type of hoist, but assuming there is no slip in the friction drive, the pinion should be run at a speed of $21 \times 80 \div 12 = 140$ r.p.m.

Examination Questions

West Virginia Examination for Mine Foremen, Oct. 26-28

(*Selected Questions*)

Ques.—What particular dangers are there in pillar drawing and what, in your opinion, should be done to prevent accidents in the performance of this work?

Ans.—When drawing pillars, the miner is working what is called a "loose end." He is particularly subject to danger from falling slate, owing to the weak support of the roof afforded by the ends of the pillars. There is also in many cases the added danger of the accumulation of gas on the falls, which may at any moment be driven down on the lamps of the miners by a slight fall of slate above.

In order to avoid accidents from the first cause, the miner should not neglect the setting of sufficient timbers behind and around him to give an added support to the roof and prevent the crushing of the end of the pillar. As far as possible, the miner should work on the rib of the pillar or in a protected position. He should watch constantly the timbers and note the action of the roof, giving particular attention to any slips that may appear in the roof slate. It is important that the miner should keep the way clear of all obstructions so that he can retreat quickly to a place of safety on the first indication of danger.

When drawing pillars in a place where gas may be generated, special care should be taken to avoid heavy local falls of roof that would furnish holes for the accumulation of gas. By maintaining a regular line of pillar work, much can be done to induce a gradual and uniform settlement of the roof along this line as the pillars are drawn back. By this means and by maintaining a sufficient current of air so conducted as to sweep the falls, any dangerous accumulation of gas can be generally avoided. Under such conditions, only safety lamps should be used by the miners when drawing pillars, and these must be carefully watched to observe any increase in the quantity of gas present. The lamps should be put in a safe position where they will be protected from injury owing to falls of roof, which are more liable to occur in pillar work than when driving rooms or headings.

Ques.—What should be considered in determining the size of pillars in mines?

Ans.—The depth, thickness and inclination of the seam; the character of the roof, coal and floor; the system of mining or plan of driving rooms and entries; length and width of the rooms and other openings; method adopted for mining the coal; and, finally, the possibility of extended periods of idleness in the working of the mine. These should all be considered as factors in determining the size of pillars required for the safe and economical working of the coal and to secure the largest recovery of the same.

Ques.—What conditions would guide you in determining the width of headings and rooms?

Ans.—The depth, thickness and inclination of the seam; the direction of driving the rooms with respect to the cleats or cleavages of the coal; the nature of the roof and floor of the seam; the method of mining adopted or the general plan of the workings; the method of mining and loading the coal at the face; and, what is very important in economical mining, the amount of waste to be handled and the length of time the rooms may have to stand idle.

Ques.—In your opinion, would a good system of timbering prevent accidents?

Ans.—A good system of timbering that is well adapted to the particular conditions existing at the working face will go far to prevent the frequent occurrence of accidents due to falls of roof and coal. In general, especially when working under a frail roof or where frequent slips occur in the roof, a systematic plan of timbering is important, and this should be maintained uniformly as the faces advance. The practice of setting timbers when and where the judgment of the average miner may dictate is responsible for many accidents caused by falls of roof and coal at the working face. Such practice should be abandoned and a proper system of timbering adopted in all mines.

Ques.—In a room with a fair roof, how far apart would you place the timbers?

Ans.—The distance of post timber, center to center, will depend largely on the nature of the roof, amount of roof pressure and the thickness and inclination of the seam. To some extent, the distance of posts apart will depend on the kind and size of timber used. Under fair conditions of roof and floor, in a moderate thickness of seam and small inclination or pitch, post timbers should be set from 3 to 4 ft. apart. Under better conditions than those named, this distance can be increased to 6 or 8 ft. apart. It is a good plan to stagger the timbers in each alternate row, so that the posts in succeeding rows will not stand behind each other.

Ques.—Where the roof is bad, how should the timbers be placed?

Ans.—When working under a frail or tender roof, post timbers should not be set more than 3 ft. apart, center to center. Good cap-pieces should be used above each post, and these should not be less than 1½ or 2 in. thick, 6 in. wide and 18 in. long. It may be necessary to use crossbars instead of cap-pieces to give a better support to the roof between the timbers. These crossbars should be parallel to the line of the working face. If the bottom is soft, foot boards should be used underneath the posts.

Ques.—Under what conditions do you consider coal dust dangerous in mines?

Ans.—The fine dust of a highly inflammable coal is dangerous under any conditions in mines. When gas is present in the mine air even in quantity too small to be detected by the safety lamp or where blasting is performed the danger owing to the presence of the dust is greatly increased unless special precautions are taken.

Coal and Coke News

Washington, D. C.

The Federal Reserve Board in its November Bulletin just published furnishes, in the Reports of Business Conditions from the several districts, some interesting comment on coal mining. The reserve agent at Philadelphia writes that "Coal-mining operations continue to improve," while from Cleveland it is stated that "the soft-coal business and coke industry is much more satisfactory, and it is nearly a sellers' market for the first time in several years." From Richmond it is reported that "Coal is in good position and its great tonnage is materially helping the railroads in caring for this territory."

An interesting report as to the position of the petroleum industry also comes from California, the reserve agent there writing as follows:

> Petroleum is one of the leading industries in this district, with a present annual production of approximately 100,000,000 barrels. This general condition would seem to assure a most favorable situation, but as a matter of fact this industry has been greatly depressed during the past few years and shows no present prospect for betterment. The production, approximating 250,000 barrels per day, about balances with current consumption, but approximately 60,000,000 barrels are in storage and there is a considerable "shut-in" production; that is, wells whose output would be immediately available if desired.
>
> Some financially strong and ably managed corporations are operating with moderate profit, but many are not operating. Effort is making to consolidate more than 100 of the smaller companies. If accomplished, the industry would be in the hands of several large corporations whose financial strength would give greater stability to the industry while apparently assuring adequate competition.

Two Visiting Commissions

Mining interests in common with others have heard with interest the current official announcement that:

> Two commissions composed of government officials and business men from European countries are expected to reach the United States within the next few days with the primary purpose of arousing interest in the extension of reciprocal commercial relations. A commission of French business men, under the leadership of the secretary of the Budget Committee of the French Chamber of Deputies, is now due in New York with the idea of devoting considerable time to a study of general commercial conditions existing in the United States.
>
> It is expected that the commission will visit the leading cities of the country, not only to study American methods of business, but also to extend the interest of Americans in French products and French markets. While the precise itinerary which the commission will follow is not known at present, the Bureau of Foreign and Domestic Commerce expects to be in possession of such information shortly after the commission's arrival and will then answer inquiries on the subject.
>
> A similar commission, representing the Amsterdam Chamber of Commerce, was expected to sail from Amsterdam on Nov. 6, reaching the United States about the middle of the month. No definite information as to the course to be followed by this commission is at present available, but it is understood that the commission contemplates going directly to Washington to confer with representatives of the government and of the Chamber of Commerce of the United States before making further announcement as to its plans.

HARRISBURG, PENN.

The sum of approximately $10,000,000 which has been collected by the coal companies in the anthracite region in preparation for payment to the state as a tax of 2½ per cent. upon all coal mined during 1913, 1914 and up to June 1, of this year, is in a badly muddled condition. This may either revert to the state through escheat proceedings, or may be kept by the coal companies, or still another bare possibility, may be refunded to the consumer who paid it.

As soon as the law went into effect the coal companies considered it necessary to prepare for paying this tax in the event their protest should not be sustained. Some of the companies added the 2½ per cent. to the bills, specifically listing it as the tax item, others less careful in the matter, or more confident of the success of their protest, merely blanketed the tax item by raising the price per ton, thus acquiring the money, but making no provision for refunding it in case it did not become necessary for them to pay it to the state as a tax.

Since then the Supreme Court of the state has declared the tax unconstitutional and now the problem of what is to be done with the money raised, comes up. The money does not belong to the coal companies, it is unconstitutional for the state to accept it as a tax. If the individual consumer has protected himself with receipts he probably can demand a refund of the tax. The sums that cannot be traced to the consumers of coal who paid the tax, will probably be escheatable to the state, such a proceeding has now been instituted and is awaiting the decision of Attorney General Brown.

Probably a majority of consumers cannot produce receipts and where receipts were given they may not bear a definite statement of the amount of the tax. Retailers may argue that the increase in the cost of coal was justified for other reasons than the state tax. In this way endless confusion may hinder any attempt on the part of the consumer to get back his money collected under an unconstitutional law.

It has been suggested that the money be divided among the hospitals in the anthracite region voluntarily by the coal companies. That would relieve the state from making appropriations to such institutions for some years, and the money thus released could be diverted to other purposes. But such voluntary distribution cannot be made until legal proceedings have been disposed of, and then only in the event that the money is left in the hands of the operators.

Final Meeting of Mine Cave Commission

The final meeting of the Anthracite Mine Cave Commission which body formulated a comprehensive and complete report of the big problem of mine caves a short time ago, was held recently and a few incidental matters of finance were discussed. The commission accomplished a deficit during its activities and the Governor has approved an appropriation of about $5,000 to cover this. A committee was organized to close the accounts.

While assembled the members of the commission discussed the general mine cave situation and its various problems. The men spoke of the experiences that have been encountered in the various districts that they represent on the commission. Several reported that the recommendations embodied in the report, relative to purchasing support, responsibility for damaged property, location of cemeteries, and the securing of public buildings against damage were being considered by the mining companies.

The commission's report has been submitted to the Governor and state legislators, but regrets that it has never been made available to mining men and others interested were expressed at the meeting. The report, with all of its tests of roof support, statistics on the amount of coal underground and the percentage that is mineable, discussion of the various methods of dealing with damaged surface property and hundreds of other phases and connected thoughts would no doubt be of interest to all persons interested in mining or in mining communities where the necessity of surface preservation in this regard has become apparent. Steps may be taken to have the report published by asking the next Legislature for an appropriation for this purpose.

PENNSYLVANIA

Anthracite

Shamokin—The discovery of a coal deposit on a farm just outside the limits of the city recently caused considerable excitement among land owners nearby, as the district was supposed to be outside of the coal bearing area.

Wilkes-Barre—Production of anthracite in October fell nearly half a million tons below the production in the corresponding month, of last year. The total output of coal for the first 10 months of the year is now approximately three million tons below that for the first 10 months of 1914. When the official figures are announced by the Anthracite Bureau of Information, it is probable that the tonnage of coal shipped to market last month will be about 6,150,000 tons. In October, 1914 the tonnage was 6,644,476 tons. The shipments for the last two months of 1914 aggregated 11,730,544 tons. As the biggest shipments for any one month so far have been 6,665,321 tons, made in October, 1912, it is obvious that only part of the shortage can be made up.

Pittston—Emphasizing the importance of timbering to the mining industry, the Pittston Mining Institute is devoting all of its Fall meetings to a demonstration of correct methods. Mine Inspector Samuel J. Jennings is conducting the demonstrations, calling into use a carload of mine props. Two sessions of the institute have already been devoted to this topic and wide-spread interest is being caused.

In line with the general plan of the Pennsylvania Coal Co. to substitute electricity for steam as motive power, the old No. 3 shaft, one of the oldest operations in Pittston, has been completely electrified. The shaft has been widened and the sides concreted. For years it has been used only as a ventilating and pumping shaft, but with remining under the city in progress, a new tower and cages have been installed. The shaft is in the central city, a stone's throw from City Hall. There had been complaint on the noise of the steam plant. The electrically-driven apparatus will be noiseless.

Bituminous

Confluence—It is reported that Philadelphia capitalists have closed a deal for the purchase of a tract of coal land in Henry Clay Township. It is said that this tract will be developed, and visions of a coal town springing up are entertained by the residents of that vicinity.

Gray's Landing—It is said that within a short time every oven at the Gray's Landing works of the American-Connellsville Coal and Coke Co. will be in operation. Two hundred and forty ovens at this plant have been idle since the Sunshine Coal and Coke Co. went to the wall. Operations will be resumed in full within a short time if enough men can be found to operate the plant.

Connellsville—The production of coke in the Connellsville region recently rose to 433,519 tons, showing a gain of 4,200 tons over the preceding week. Shipments during the same time amounted to 441,911 tons, which filled 11,968 cars.

VIRGINIA

Abingdon—The increasing demand for laborers in the southwestern Virginia field is being well met, according to reports received here. Special activity in Wise and Lee counties is reported and laborers are being recruited in numbers throughout the South.

WEST VIRGINIA

Charleston—It is said that West Virginia coal operators are facing the greatest car shortage that has affected the shipping trade within four or five years. Railroad men state repairs to cars and the purchase of new rolling stock have been at a standstill for some years on account of the low tariffs enforced by the Interstate Commerce Commission, and that sufficient time has not been had since the lifting of the Federal ban to enable the companies to put on sufficient cars to take care of the present heavy demand.

It is expected that a state association of coal company accountants will be organized within a few weeks. It is hoped by the West Virginia operators that through the installation of a uniform system of computing cost of production they will be enabled to save considerable expense each year. It is the intention to install such a system of keeping cost accounts.

The controversy between the Public Service Commission and the United States Coal and Coke Co. over the desire of the latter to withdraw from participation in the benefits of the workmen's compensation fund, was recently ended when the company paid $15,200, calculated by the commission as owed by the company as its share of the deficit. Upon the receipt of the check the commission formally accepted the withdrawal and the company's election to assume its own responsibility for claims due its employees for accidents and fatalities.

Fairmont—Traffic over local railroads destined to the Great Lakes will be discontinued after Nov. 15, according to a report received recently at the local railroad offices. It is the intention of the navigation companies on the lakes to hold the season open till a later date this year on account of many manufacturing concerns in the Northwest not being able to lay in a large supply of fuel. The navigation companies, however, consider that the passage of boats is too dangerous after the above named date, and will officially declare the shipping season closed on Nov. 15.

TENNESSEE

Knoxville—The next examination for mine foremen in all classes of mines, including both coal and metal mines, and for fire bosses will be held in the Atkins Hotel, Knoxville, Tenn., Nov. 23, 24 and 25, 1915. This examination will be both practical and technical.

KENTUCKY

Whitesburg—The Allegheny Coal and Coke Co., at Lookout, has fired an additional 100 coke ovens. This is the only company in the Big Sandy section which cokes its product.

Barbourville—Many of the mines in this section are working night shifts, in contrast with the situation here early in the year when few of the mines were operating more than two or three days during the week. A full run throughout the winter is expected by the trade.

Hartford—The commissary of the Williams Coal Co., at the Williams mines near here, has been destroyed by fire, together with the stock and the residence of Guy Stateler, manager of the store. Mr. Stateler's garage and other buildings also were destroyed.

OHIO

Barton—The Barton Coal Co. is constructing a bridge over the St. Clairsville branch of the Baltimore & Ohio R.R. for the purpose of making another opening in the hill and loading from both openings over one tipple. The improvement will increase the output of the mine.

Senecaville—The Cleveland mine of the Morris Coal Co., which has been idle since Aug. 1 has been re-opened with approximately 200 miners.

ILLINOIS

Belleville—The Royal coal mine, on the Louisville & Nashville R.R., after being closed more than two years, resumed operations recently. It will be operated only part time the rest of the year.

The Pittsburg Mining Co. has filed suit in the Circuit Court against the Fischer Coal and Ice Co., Fred and George Gramlich and Alfred Rodenmeyer to recover $1,000 said to be due on a note.

Mt. Vernon—All the miners employed in Mine No. 1 of the Big Creek Coal Co. were on strike two days recently on account of the discharge of three pit bosses. After a conference with the company officials the miners returned to work, pending reference of the dispute to the president of the United Mine Workers of the district.

Lenzburg—Walter J. Grant, of Danville, referee in bankruptcy for the Federal Court of this district, opened bids a few days ago for the mine of the Tirre Coal and Mining Co., of this place, against which bankruptcy proceedings are pending. The only bid submitted was $2,000 and was rejected. Referee Grant ordered a public sale of the property on the courthouse steps in Belleville, Ill., on Nov. 20. The sale will be conducted by P. B. Cheeney of East St. Louis, who was appointed trustee by the creditors. The company's assets are listed at $12,500 and the liabilities at $11,000. The company was thrown into bankruptcy in August on the petition of Mrs. Mollie E. Tirre and F. E. Tirre, of St. Louis and William F. Zager, of Lenzburg. Mrs. Tirre alleges that she loaned the company $14,441 and F. E. Tirre says the company owes him $1,680 salary.

MISSOURI

Kirksville—J. C. Ward, who has been president and general manager of the Big Creek Coal Co. since Mar. 23, has sold his interests in the company to the other shareholders and will devote himself to the development of his own coal properties. G. W. Hartsock, of Albia, Iowa, has been elected president of the Big Creek company and Treasurer J. R. Brown will take over the duties of general manager. William Richardson remains secretary. The company's development work will be continued.

COLORADO

Denver—As a means of communication between the management and the employees and the public the Colorado Fuel and Iron Co. has issued the first quarterly number of the "Industrial Bulletin." This is published under the direction of C. J. Hicks, executive assistant to Pres. J. F. Welborn. The "Bulletin" gives a full statement of the industrial plan drafted by John D. Rockefeller, Jr., during his recent visit and which had been adopted by the miners in all of the company camps in Colorado and Wyoming. It is illustrated and contains much matter of interest and value to the employees.

FOREIGN NEWS

Toronto, Canada—Thomas Richardson, labor member of the British House of Commons for Whitehaven, and Robert Baird, secretary of the Coal Mine Owners' Association of Lanarkshire, Scotland, were in Toronto recently on their return journey from British Columbia, where they have been engaging coal miners to work in the British collieries. They have secured 260 men, 40 of whom take their families with them. The British Government advances their fare to England to be repaid by instalments from their wages. The pay for mining work in the Old Country at present is about $4 per day and in some cases more.

PERSONALS

Captain F. A. Hill, well known mining engineer of Seattle, Wash., has recently been on a professional visit in California examining the mother lode.

Frank H. Crockard, of Birmingham, Ala., vice-president of the Tennessee Coal, Iron & R.R. Co., is spending a few weeks in Atlantic City, N. J., recovering from a nervous breakdown.

Daniel R. Blower, state mine inspector for the 11th Bituminous District of Pennsylvania, has accepted the position of mine inspector for the Vesta Coal Co., with headquarters at California, Penn.

W. G. Thomas, for many years with the Madeira-Hill Coal Co., recently succeeded to the general managership of the Madeira-Hill operations in the anthracite region upon the death of Frank A. Hill.

Walter E. Auld has been appointed sales agent of W. A. Stone & Co., with office in Buffalo. He has for several years been connected with the Buffalo office of the Delaware, Lackawanna & Western Coal Co.

Andrew Calderwood, for many years general mine foreman for the Campbell Creek Coal Co. of West Virginia, has been appointed district mine inspector to succeed the late Enoch Carver in the seventh district.

R. R. Bunnell who represented the Skeele Coal Co. of New York in New England has resigned and will hereafter be identified with the Seiler-Blanchard Coal Co. of New York, with offices in the Kelsey Building, Springfield, Mass.

D. A. Thomas, the commissioner of munitions, who was sent to this country and Canada by Lloyd George to look after all contracts made for the British Government, recently underwent two operations in a private sanitarium in New York.

Ivor Livingston, of New York, has been employed as superintendent by the First Creek Coal Co., at its mines near Hazard, Ky. Mr. Livingston is one of the leading mining engineers in the South and is a graduate of the University of Tennessee.

Glenn A. Knox, of Fontier, Wyo., recently accepted the superintendency of the mines of the Standard Coal Co. at Standardville, Utah. These mines are located about six miles above Helper and have a capacity of approximately 1,000 tons per day.

Eli T. Conner, consulting engineer to the Delaware & Hudson Co. and to the Hudson Coal Co., has occupied offices in the new Union National Bank Building, Scranton, Penn. He will continue his principal office at 1315 Stephen Girard Building, Philadelphia, Penn.

C. S. Oldroyd, 922 Holston National Bank Building, Knoxville, Tenn., representing the Manierre box car loader and the Plymouth gasoline locomotive, has also taken the agency for the Halby shoveling machine, manufactured by the Lake Shore Engine Works, Marquette, Mich., representing this firm in the states of Tennessee, Kentucky, Virginia, West Virginia and Alabama.

Warren R. Roberts, president, and Edward E. Barrett, vice-president, of the Roberts & Schaefer Co., Chicago, have just returned from Canada where they signed a contract with a large coal company for the design and construction of an electrically operated anthracite coal dock bridge and storage plant. This will be one of the most modern installations of its kind in the country.

OBITUARY

Winfield Scott Solomon, for the past 16 years connected with the Lehigh Valley Coal Co. as general boiler inspector and superintendent of boiler plants at its various collieries in Luzerne, Lackawanna and Schuylkill Counties, died recently at Wilkes-Barre.

W. H. Johnson, of Birmingham, Ala., traffic manager for the Southern District of the Republic Iron and Steel Co., which position he has held for many years, died recently at his residence, 1113 Twelfth Avenue, South,, of tuberculosis. Mr. Johnson was 44 years old at the time of his death.

INDUSTRIAL NEWS

Louisville, Ky.—Western Kentucky coal operators have requested the Kentucky State Railroad Commission to intercede in their behalf with the Interstate Commerce Commision.

Youngstown, Ohio—The La Belle Iron Works has just issued $2,000,000 worth of bonds, with which to finance a battery of 94 coke ovens which it recently erected at its plant.

Philadelphia, Penn.—The Stonega Coal and Coke Co. has increased the facilities of its tidewater service by the purchase of the coal-carrying vessels "Raymond McNally" and "Dorothy."

Hazard, Ky.—The First Creek Coal Co. recently awarded the contract to the Fairmont Mining Machinery Co. for a rope and button retarding conveyor for the coal company's new development at Hazard.

Washington, D. C.—The Interstate Commerce Commission has refused the request of the Delaware, Lackawanna & Western R.R. to increase the rates of freight on anthracite shipments 25c. a ton from Taylor, Penn., to tidewater.

St. Louis, Mo.—The Livingston mine of the Rudledge & Taylor Coal Co., located in central Illinois on the Chicago and Eastern Illinois, and Big Four railroads, recently broke its previous record by loading 4,888 tons of coal in eight hours.

Uniontown, Penn.—A shipment of 7,000 tons of coke for the Italian State Railways was recently made. This is the first cargo of coke to be exported to Italy in many years, and freight charges will be about three times the original cost of the coke.

Cincinnati, Ohio—Suit has been filed by the Western German Bank, of this city, against Edwin Marmet, of the Marmet Coal Co., on a note for $27,500, secured by stock. There has been no default in the payment of interest on the note, but the bank desires to enforce payment.

Charleston, W. Va.—Each of the West Virginia representatives in Congress has been asked to introduce an investigation into what the coal operators of the state term "an illegal combination of railroads, operators and coal miners of other states to destroy the coal industry of West Virginia."

Birmingham, Ala.—One thousand tons of coke is being loaded as fast as cars can be furnished to the Yolande Coal and Coke Co. This will be shipped to New Orleans for export. A good price was obtained for this coke and it is believed in industrial circles that this is the forerunner of an extensive coke export business.

Philadelphia, Penn.—For the month of September the gross receipts of the Philadelphia & Reading Coal and Iron Co. showed a loss of $672,092 as compared with the same month last year. The total deficit in net earnings for the three months ending with September amounts to $228,962, with a deficit in surplus for the same period of $252,962.

Philadelphia, Penn.—In its monthly statement of car movement the Pensylvania R.R. reports that 57,027 cars of bituminous coal were moved eastward during the month of October, being an increase of 14,503 over September, or 34.4 per cent. During the same period 4,189 cars of coke were moved in the same direction, being an increase of 1,676, or 66.7 per cent.

Whitesburg, Ky.—Coal operators in the Kentucky River district comprising the Hazard, Boone's Fork and Elkhorn fields are experiencing no difficulty in getting ample cars and everything is booming in all the coal mining plants hereabouts. Some of the mines are having a little trouble in holding miners, especially foreigners, owing to the progress of the European war.

Philadelphia, Penn.—Notice has been received by local shippers of bituminous coal that the new tariffs increasing the differential on West Virginia coal to Western points by 15c. will be filed with the Interstate Commerce Commission on Nov. 15 by the Baltimore & Ohio, Chesapeake & Ohio and Norfolk & Western railroads. This will make the new rates effective as of Dec. 15.

Cleveland—The Youghiogheny and Ohio Coal Co. recently awarded a contract to the Fairmont Mining Machinery Co. for changing the method of weighing coal to the run-of-mine basis at the Florence mine. A center dump basket with operating mechanism, scale, and continuous apron feeder for elevating the coal from basket dump hopper to the screening equipment will be installed.

Issaquah, Wash.—The Issaquah & Superior Coal Co. mine at Issaquah, Wash., will be reopened and put on a producing basis at once. The mine has been leased by Pennsylvania capitalists. The mine was closed down on account of financial difficulties and the new operators take over a burden of $8,000 in back wages to the miners. This will be repaid at the rate of a royalty of 15c. per ton.

St. Louis, Mo.—The Williams Patent Crusher and Pulverizer Co. is urging its customers to send in lists of needed repairs to their crushers as early as possible, as extreme difficulty is being experienced in procuring iron and steel with which to build crusher parts. It is believed by the Williams company that the difficulty in securing iron will increase rather than diminish.

Philadelphia, Penn.—The New York Shipbuilding Co., of Camden, has received the contract and has commenced the construction of a 12,500-ton collier for the Darrow-Mann Co., of Boston, Mass. On the completion of this vessel the company will build another of similar capacity and both boats will be placed in the coastwise coal trade under the management of the Coastwise Transportation Co.

Edwardsville, Ill.—A coal man should not be compelled to serve on the grand jury during his busy season, in the opinion of Judge J. Frank Gillham of the Madison County Circuit Court. He recently excused Charles W. Huskinson, an Alton coal dealer, on that ground. Huskinson was called on the jury but when he told the Judge it was his best season for making some money he was told to go about his business.

Amherstdale, W. Va.—The Fairmont Mining Machinery Co. recently received a contract from the Prockter Coal Co. for a complete equipment of its new development. This will consist of a dump, hopper, feeder, apron conveyor, three-track shaker, screen equipment, including two picking tables, and loading booms with refuse and mixing conveyors. When completed this will be a modern plant, with a capacity of 2,000 tons per day.

Harrisburg, Penn.—It has been announced by officers of the Gamble Fuel Briquette Co. that ground has been broken for the erection of a plant to turn out some 20,000 to 25,000 tons of specially prepared fuel per year. It is believed that operations will be begun early next year, and it is announced that the briquettes will be free from coal tar pitch which has been the smoke producing constituent of most of the coal briquettes heretofore manufactured.

Bessemer, Ala.—The Woodward Iron Co. has decided to open another coal mine in order to secure a larger supply of coal for its furnaces and ovens. It has been decided that a slope should be opened some distance from Dolomite, but striking the same bed of coal and getting a shorter underground haul than the company now has at the former mine. It is understood that this slope will be 600 ft. long and will be equipped in a thoroughly modern manner.

Scranton, Penn.—It has been announced that the Temple Coal Co. has decided to refund to its patrons the coal tax paid by them under the act of 1913, which has been declared unconstitutional. This is the first company to make a definite announcement in this regard. When the law was placed in effect instead of making the tax a separate item on the circular this company added 10c. to the prepared coal sizes and 5c. to pea and smaller and it is on this basis that the refund will be made.

East St. Louis—Traffic officials of east side railroad lines, at a meeting recently, decided to waive collection of the increased rate on coal shipments from Illinois mines to East St. Louis accruing between Feb. 1 and Oct. 1. An increase of 5½c. a ton was allowed, effective Feb. 1, 1915, but was suspended by the Illinois Public Utilities Commission until Oct. 1. It was the conviction of the traffic officials that they had a legal right to enforce collection of the rate from the original date, but to avoid complications and contentions it was decided to make no effort to collect the increase except from Oct. 1, when it was sanctioned by the Illinois commission.

Coal Trade Reviews

General Review

Anthracite trade marking time pending arrival of colder weather; shipments behind last year and general tone excellent. Bituminous just holding its own. High record ocean freights restrict exports. Contradictory developments at interior points.

Anthracite—There is an excellent tone to the hard-coal trade with conditions uniformly favorable. Mining operations are at full capacity and there is no demurrage coal in any direction. Collections are in a more satisfactory condition than for a long time, and dealers are showing a disposition to keep full stocks so that any cold snap will start coal moving all the way back to the mines. Shipments so far have been filled with reasonable dispatch, but it is difficult to anticipate what may develop with colder weather. Concessions on the regular circular have been generally eliminated and prices are well sustained. Lake shipments for the season to the first of the current month, are slightly behind last year, but the movement continues heavy in spite of high vessel rates. September shipments show a gratifying increase but the movement to date for the year indicates a deficiency of close to 3,000,000 tons that is yet to be made up.

Bituminous—The absence of any spot business is creating a tendency to shade the circular in several instances, while the general publicity regarding a possible car and labor shortage is not influencing shippers seriously, and many are eager to cover for deliveries up to the first of the year. Some small operators are sending considerable consignment coal to the market but this is readily absorbed for storage purposes. Shipments are beginning to come through more slowly as the season advances, and certain railroad centers are now beginning to show definite indications of a congestion. The market has stiffened up moderately, the price tendency being upward, and shippers as a rule will not commit themselves beyond the first of the year.

Exports—With ocean freights at the highest level in the history of the mercantile marine, negotiations involving further exports of coal are practically at a standstill, though there is still much inquiry noted. The movement still continues on charters negotiated at the more reasonable figures prevailing some time ago, but the tonnage is showing a discouraging falling off. The October dumpings at the Hampton Roads piers were substantially less than the September figures, while the Baltimore exports touched the lowest point for the past four months. There seems to be little prospects for any relief in the vessel situation.

Lake Markets—With the iron and steel industry apparently up to full capacity, there has been no further increase in the demand for prompt coal in the Pittsburgh district, though prices on contracts have stiffened up still further. The situation is in some respects contradictory. Shippers with several outlets, particularly toward Tidewater, are doing substantially better than those with a more restricted market. Canadian reports continue discouraging. For the time being the market is undoubtedly holding its own, but when the Lake movement is closed, there are some uncertainties to be faced. In Ohio, requisitions are steadily increasing, the congestion and slow movement on the railroads exerting a stimulating influence and causing some anxiety among consumers. The domestic trade is still marking time pending the advent of lower temperatures. There is little consignment coal in evidence.

Middle Western—The high temperatures have created a marked dullness in the Middle Western domestic coals, but prices have been firmly maintained. The steam demand continues on about the same basis as before, and there is no complaint heard in this branch of the business. Curtailed output has had a beneficial effect in sustaining the market. The future outlook on both steam and domestic grades continues as encouraging as ever, and shippers are anticipating a large business at profitable figures through the balance of the season. Shipments out from the upper Lake ports have also been affected by the warm weather, and have fallen off somewhat during the past week, though this is regarded as only temporary.

A Year Ago—Anthracite trade marking time pending more seasonable weather. Bituminous operators becoming discouraged at the long delay in the expected improvement. Shortage developing in ocean freights.

BUSINESS OPINIONS

Iron Age—The Steel Corporation's statement that its unfilled orders increased 847,000 tons last month gave the first definite measure of the steel trade's sensational leap forward in October. This is an unparalleled record but is thus only in keeping with all other developments in the current market. Price advances have had no effect of curtailing demand; it is in fact heavier now than at any other stage in the present remarkable movement. In the flood of orders in October domestic business figured to a larger extent than in many months. Exports in September of products reported by weight were 381,000 tons, against 401,000 tons in August. Values of all iron and steel exports, including machinery, were $38,400,000, against $37,727,000 in August. The scarcity of vessel room may have prevented the increase looked for in September, but the statistics raise the question whether the war export movement has yet reached its full maximum height.

Boston News Bureau—General confidence in this country is increasing every day. Conservative bankers are convinced that the commercial markets are making big strides forward. These close observers say that the country has been headed right for a considerable time but that now we have a breeze behind us and are speeding our pace up to maximum. Sometimes we are deceived because we are prone to take our cue from the security market, and whenever a reaction occurs there we attribute it to some serious defect in the general situation. But we forget that the stock market at times becomes overbought and that liquidation is the only corrective. It is best opinion that conditions are astonishingly sound. We are heavily long of both crops and money, two distinctively necessary ingredients.

The Southern Lumberman—Despite somewhat heavier shipments than orders with sharp increase in shipments and slight decrease in orders, the yellow pine market this week shows no diminution in strength, and in fact, when condition of stocks on hand is considered, the market is regarded as quite as strong as last week, which was the best week experienced by yellow pine manufacturers since the European war broke out. Price advances continue with remarkable frequency and from mills in all parts of the Southern producing territory. Better prices are also being obtained on numerous hardwood items this week, but such increases hardly keep up with the increased movement. This is due to a certain extent, no doubt, to the fact that the call is unusually well distributed and not centered on certain woods or particular grades of such woods, as is frequently the case.

Marshall Field & Co.—Current wholesale distribution of dry goods has been in excess of the corresponding period of a year ago. Road sales for immediate and spring delivery show marked increases and customers have been in much larger numbers. Collections are normal. Prices are firm.

Bradstreet—Two features loom large in this week's reports—the ever-widening activity of trade and the increased momentum attained in many industries. Out of these grow overtime in factory, mill and shop; progressive improvement in industries, almost wholly dependent on domestic wants; larger pay rolls; sustained, if not increased, demand upon jobbers and wholesale dealers; more confident future buying accompanied, however, by urgent calls for goods already ordered, and although mild weather has prevented retail trade in the cities from running its full course much of the slack in this respect has been taken up by increased buying in various country districts.

Dun—Though a full measure of recovery is not yet apparent in every branch of domestic enterprise, evidences of returning prosperity are multiplying throughout the commercial world. Of late, the constructive movement has swung forward with a rapidity seldom equalled, and in some respects recent developments are wholly lacking in precedent. Pronounced expansion in the volume of transactions and a further growth of optimistic sentiment featured the month just ended, when several new high records, including those of both production and distribution, were established.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River unchanged. Delivered prices for next season still show a downward trend. Georges Creek apparently in comfortable supply, but a mild flurry prevails in the preferred grades from Pennsylvania. Water freights advance. Anthracite trade satisfactory.

Bituminous—The Pocahontas and New River market shows the same features that have prevailed now for nearly a month. Prices f.o.b. are being held with reasonable firmness, but there is still a lack of spot business and in consequence a disposition here and there to shade the $2.85 basis. The Southern coals are in ample supply and no talk of car shortage has so far materialized in decreased shipments from the fields that find outlet through Hampton Roads. There is even an eagerness on the part of most of the agencies to place coal for delivery between now and Jan. 1. Contract demand is slightly improved, probably on account of the publicity given labor conditions in other regions, but dispatch is excellent and the requirements of consumers in this territory are being promptly met. Apparently a "flurry" in Pocahontas and New River is some weeks off.

A considerable factor in the New England situation is the unwholesome scramble that has been going on now for three or four weeks for contracts next season on a minimum delivered price basis. The canvassing is being done very quietly, but is none the less effective. As low as $3.40 on cars Mystic Wharf, Boston, Apr. 1, 1916, to Apr. 1, 1917, has been named on relatively small orders and already some of the larger buyers are showing their confidence that prices will go even lower. Each merchant is "protecting" his usual tonnage and the outcome is going to be very interesting.

There are still comfortable supplies of Georges Creek available at all the piers, and some of the far-sighted dealers are lining up for their winter requirements. Shippers of this grade who own their own transportation are profiting somewhat by the advance in water freights on such spot sales as they have made. F.o.b. prices on Georges Creek are so generally covered by contract in this territory that quotations rarely vary.

Cars all-rail are beginning to come through very slowly and certain of the transfer points show signs of congestion. There is every prospect that this condition will grow worse as the month advances and the first effect will be redoubled efforts on the part of consumers to get forward extra supplies.

Water Freights would have advanced more sharply had the rough weather continued. As it is, $1 has been paid to Boston from Hampton Roads and it is likely that $1.10@1.15 will be the market within a few days. Consumers are anxious over shipments on contract, particularly at points that will soon close to navigation, and the even balance of supply and demand has been upset.

Anthracite trade is active. Retailers have been unusually busy and they adhere to their policy of keeping full stocks for the season's demands. Broken is the size in shortest supply, but most requisitions are pretty well distributed between the other domestic sizes. The shipping companies are filling orders with reasonable promptness.

Bituminous quotations, f.o.b. loading ports at points designated, are about as follows per gross ton:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields	$2.25@2.75	$2.55@3.00	....	$0.95@1.50
Cambrias and Somersets	2.45@2.95	2.70@3.20	....	1.20@1.65
Georges Creek	2.92@3.02	3.22@3.32	$2.85@2.95	1.67@1.77

Pocahontas and New River prices, on cars Boston, are $3.45@3.73. Providence, $3.45@3.63; and f.o.b. loading port at Hampton Roads, $2.80@2.85.

NEW YORK

No snap in hard coal, but prices are steady. Mining operations active with plenty of orders. Healthy situation in bituminous. Car shortage serious. No surplus at Tidewater and prices are good.

Anthracite—The desired snap is lacking in the anthracite trade. Conditions are generally favorable, except some colder weather will be necessary to give the desired snap. Most operators have sufficient orders now to keep them going for the next several weeks. Independent operators are now getting the full company circular for their prepared coals. Demand is such that there is no great amount of coal on the docks, but this scarcity is of no great moment at this time. Some shippers are experiencing trouble in getting shipments through from the mines on account of the freight congestion on nearly all roads leading to Tidewater.

Stove coal is the shortest of the prepared sizes. There is plenty of nut, while egg is easy and long; at times it is possible to pick up the latter size at from 5 to 10c. off, but this is the exception. In the line trade everything is bringing full circular. Pea coal is easy. Of the smaller coals the high grades are practically out of the market, some of them being quoted at slight premiums.

Quotations per gross tons, f.o.b. Tidewater, are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$5.20@5.30	5.35	$5.25@5.35
Stove	5.30	5.20@5.30	5.35	5.25@5.35
Chestnut	5.55	5.40@5.55	5.60	5.50@5.60
Pea	3.50	3.25@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.25@2.75	2.80	2.25@2.80
Rice	2.25	1.85@2.25	2.30	2.00@2.30
Barley	1.75	1.50@1.75	1.80	1.75@1.80

Bituminous—There has been no let-up in the demand for bituminous coal, but shippers are handicapped by the lack of cars. Large consumers are anxious to accumulate stocks before the usual winter transportation difficulties start in and are urging deliveries. While the railroads are in some instances giving operators about 75% of their quota of cars, the shipments equal but a little more than 50% of normal production.

Spot coal is not as plentiful as a week ago and good prices are being obtained as a rule. Many small operators are sending consignment coal to the local market, but unless it is of the poorer grades there is no trouble in marketing it.

Contract buyers are taking all the coal they can get and asking for extra lots. Prices are being well maintained and hardly any coal can be picked up at Tidewater for less than $2.70 f.o.b. Slack continues strong at from 95c. to $1. Exporters tell of many inquiries, but complain of lack of bottoms. Bunkering continues active.

Current quotations per gross tons, f.o.b. New York, are as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85
Georges Creek Tyson	2.95@3.00	2.95@3.00	2.95@3.00	1.40@1.45
Clearfield:				
Medium	2.80@2.85	2.80@2.85	....	1.25@1.35
Ordinary	2.75@2.80	2.75@2.80	....	1.20@1.25
Broad Top Mountain				1.25@1.45
Cambria County:				
South Forks	3.05@3.10	....	....	1.50@1.60
Nanty Glo	2.90@3.00	....	....	1.35@1.45
Barnesboro	2.85@2.90	....	....	1.30@1.35
Somerset County:				
Quemahoning	....	2.90@3.00	2.90@3.00	1.35@1.45
Medium	2.80@2.90	2.80@2.90	2.80@2.90	1.25@1.35
Latrobe	2.70@2.75	....	....	1.15@1.20
Greensburg	2.90@3.00	....	....	1.25@1.35
Westmoreland	3.20@3.30	....	....	1.45@1.55
West Virginia Fairmont ¾		2.70@2.80	2.70@2.80	.90@1.10
Fairmont mine-run		2.70@2.75	2.70@2.75	.90@1.00
Steam		2.70@2.80	2.70@2.80	1.15@1.25
Western Maryland		2.70@2.80	2.70@2.80	1.15@1.25

PHILADELPHIA

Anthracite moving steadily. Advance in pea has little effect. Buckwheat well taken, with special grades scarce. Broken strong, egg off circular, stove firmly held, and chestnut improving. Bituminous continues active, with prices unchanged.

Anthracite—While there has been no special rush the business has been steady and satisfactory. It is apparent that most dealers have decided to carry full stocks and every cold snap from now on will bring business to both branches of the trade. We still consider the future bright for months to come. With the possible exception of egg size, all shippers are asking full circular prices. Everything is apparently going at full tilt, including all washeries, and there is not a car standing on demurrage at the scales.

There is much speculation among coal dealers as to when the state-tax "melons" will be cut and a great deal of good-natured dunning of the shippers to refund the tax. One or two of the larger concerns are quietly preparing checks and, after being assured by their legal departments that there can be no entanglements with the state, will probably do some clever advertising and cater to the good-will of their trade by trying to be the first to remit.

The raise in the pea coal price has had little or no effect on the coal trade. Large shipments are coming in, but it is practically all at the $2-and-tax price which has been protected until Jan. 1. The only sales noted at increased figures were to the out-of-town dealers or the smallest of the city trade. After the first of the year the price will surely stiffen and it is even intimated that it will go to $2.50 and the tax. Buckwheat is well cared for and at least one of the big companies will accept no business below $1.35 or $1.40. Special grades of this size have grown exceedingly scarce the past week, which is also the case with several special classifications of rice coal, although the latter is still heavy; thousands of tons of rice have been stored in the city during the last few weeks.

Of the larger sizes broken is all sold up with increasing inquiries noted from concerns desirous of storing from two to three months supply. Egg is dragging along at from 15 to 25c. off circular. Stove is very firm and maintains the lead in the family sizes, while chestnut is rapidly improving and is now bringing full circular in nearly all instances. Collections are quite satisfactory, and the good tidewater trade continues.

The circular prices per gross ton at the mines and for tide shipments f.o.b. Port Richmond are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.50	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—It has been a most uneventful week, with the trade marking time. A good tonnage is moving, but the shippers are dissatisfied and believe that it should and could be very much heavier. The orders are on hand and it is difficult to tell whether the car supply or the growing labor shortage is the greatest contributing factor to the condition. No one doubts their ability to get plenty of new business, the greatest anxiety being to get shipments. Under such circumstances, of course, the mining people are not at all interested in tieing themselves up with contracts, although consumers are anxious and pressing hard to close at present prices for more or less long terms.

Only a fair export tonnage is moving vessels being scarce and freights high. Prices per gross ton at mines are:

Georges Creek Big Vein	$1.70@1.80	Fairmont gas, ¾	$1.35@1.45
South Fork Miller Vein	1.55@1.65	Fairmont gas, mine-run	1.20@1.25
Clearfield (ordinary)	1.20@1.30	Fairmont gas, slack	.90@1.00
Somerset (ordinary)	1.20@1.25	Fairmont lump, ordinary	1.15@1.20
West Va. Freeport	1.05@1.15	Fairmont mine-run	1.00@1.10
		Fairmont slack	.90@1.00

BALTIMORE

Falling off in export movement, and a greatly improved car supply are features of trade. Demand for all fuels fairly steady and market generally strong.

The falling off in export movement is the feature of the trade here. The principal reason is the excessive freight rates brought about by the fact that bottoms are naturally scarce and the grain trade is absorbing the better part of the ships that report here. During October a total of 139,652 tons was loaded for foreign ports, which is a decrease from the figures of September, August, July and June. Last week only 16,925 tons were loaded for foreign account, which makes it appear that November will show another falling off.

Car supply is much better. The election period lay-off at the outset of the month gave the railroads a chance to catch up. A little more free coal was offering, although the market remained firm at about the figures of the previous week. Prices in gross tons to the trade are as follows:

	Mines	Balt.*	Fairmont	Mines	Balt.*
Geo. Crk. Big Vein	$1.80	$2.98	Ordinary mine run	$0.95	$2.33
Geo. Crk. Tyson	1.50	2.68	Ordinary ¾	1.00@1.10	2.43@2.53
Clearfield	1.30	2.48	Ordinary slack	1.00@1.05	2.43@2.48
South Fork	1.50	2.68	Low sulphur mine-run	1.20	2.63
Latrobe	1.10	2.18	Low sulphur ¾	1.30	2.73
Somerset (best)	1.45	2.63	Low sulphur slack	1.00@1.05	2.43@2.48
Somerset (good)	1.25	2.43			
Quemahoning	1.35	2.53			
Freeport	1.10	2.18			
Miller Vein	1.30	2.38			

* F. o. b., outside Capes.

HAMPTON ROADS

Dumpings for week light. Total shipments for October 1,236,203 tons. High vessel rates curtail foreign business. Movement confined principally to contracts.

The dumpings for the week have been rather light both as to export and coastwise movement. Italy is still taking the greater part of the export coal but the number of cargoes for the week has been less than usual. The New England market as usual has taken the greater part of the coastwise movement. The government has loaded some coal into colliers for cargo and bunkers but these takings have not been extra heavy. The number of bunker steamers calling has also been light. There is practically no change in prices and few spot sales have been made during the week, the greater part of the movement being on contract.

During the month of October there was shipped from Hampton Roads ports a total of 1,236,203 tons of coal of which the Norfolk & Western Ry. dumped 637,005 tons, the Chesapeaks & Ohio Ry. 335,734 tons and the Virginian Ry. 263,464 tons. While the October movement was not a record it compares favorably with the monthly average since the beginning of the war. The scarcity of vessel tonnage for export cargoes and the high rates are largely responsible for the reduced movement in October as compared with September.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

	Week Ending				
Railroad	Oct. 9	Oct. 16	Oct. 23	Oct. 30	Nov. 6
Norfolk & Western	140,934	145,236	163,920	126,145	......
Chesapeake & Ohio	93,344	66,361	81,517	74,028	78,210
Virginian	65,150	54,964	51,304	78,237	46,952
Totals	299,428	266,561	296,741	278,410	.....

OCEAN FREIGHTS

The freight market is to-day at the highest level it has ever touched, and is still advancing. Over $18 per ton has been paid on grain to the west coast of Italy, and time charter rates advance daily. Tonnage is more than scarce and the few available boats are all asking for grain, making it very difficult to operate in coal. The market is changing daily.

To	Rate	To	Rate
Havana	$2.75@3.00	Bermuda	$3 50
Cardenas or Sagua	3.00@3.25	Vera Cruz	5.00@ 5.50

Demerara	6.00@6.50	Marseilles	15.60@16.80

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Prompt coal strong and unchanged. Contract coal slightly stiffer, particularly slack. Operations 75% of capacity. Car supply continues off.

The market for prompt coal has not stiffened further, but there is a decidedly stronger tone in contract coal, and particularly in slack. There has been no material increase in demand for free coal in the past week or two. The iron and steel industry had already worked up to its maximum capacity, while the same can be said of the railroads, which have had full employment for cars and locomotives for weeks. Domestic demand has not yet reached important proportions. For several weeks there has been stocking by railroads and to some extent by manufacturing consumers, while public service corporations, unable to take any risks, have been stocking steadily in a regular and conservative manner. With the recently improved outlook for coal the operators have been striving for production and thus the offerings are larger. The prompt market holds its own readily, but the market is nearing the time when Lake shipments will close, throwing additional coal on the market, before there is much demand for stocking coal against a possible mining suspension Apr. 1. It seems to be more or less generally expected that a wage advance will be demanded and granted, the uncertainty being chiefly as to whether or not the negotiations will be accompanied by a suspension of mining.

Gas slack has become distinctly stiffer and the slack market is quotable at a wider range than formerly. Mine-run is usually done at $1.15, though many operators are asking $1.25 and occasionally securing this price. We quote prompt coal as follows: Slack, 70@85c.; mine-run, $1.15@1.25; ¾-in., $1.25@1.35; 1¼-in., $1.35@1.50, per net ton at mine, Pittsburgh district.

There are scarcely any more car shortages than a week ago, but the supply in general is quite below the desires of the trade and there is considerable complaint. Mining operations are at about 75% of capacity in the Pittsburgh district.

Contract coal, to Apr. 1, is firmer, but former minimum prices are still done on the most desirable contracts, except as to slack, which is extremely stiff. Demand for slack has been such in recent weeks, with a large tonnage of ¾-in. being produced for the Lake trade, that it is considered rather unlikely that the normal course of production will furnish a sufficient supply through the winter, and the question is already being canvassed whether slack will eventually reach the mine-run price. It costs scarcely anything, it is stated, to install crushing machinery, so that whatever the demand for slack the market cannot advance above mine-run figure. We quote on contracts to Apr. 1: Slack, 90c.@$1; nut, $1@1.10; mine-run, $1.15@1.25; ¾-in., $1.20@1.30; 1¼-in., $1.30@1.40, per net ton at mine, Pittsburgh district.

BUFFALO

Difference of opinions regarding the market. Local market less active than Pittsburgh and Tidewater. Prices differ widely. Anthracite improving locally.

Bituminous—The movement is fair, but dealers are much divided as to both prices and demand. Those dependent on the Pittsburgh market, are asking prices considerably higher, while the Allegheny Valley shipper is finding the going hard. It is not easy to reconcile this difference. Pittsburgh and the districts that can ship to Tidewater are independent of this market and are in some instances quoting fictitious prices to evade commitments in this direction. Allegheny Valley producers are restricted to this market and have to sell for what the consumer will offer. The difference will probably not last long. At the same time this market is clearly waiting for a return of activity in Canada and till that occurs the bituminous trade here will be dull. Quotations, therefore, will have to appear a little out of level, being as follows:

	Pittsburgh	Allegheny Valley	Penn Smokeless
Lump	$2.80	$2.50	$2.55
Three-quarter	2.65	2.30	.....
Mine run	2.55	2.20	2.30
Slack	2.20	1.90	2.30

These quotations are for Buffalo and eastward to Rochester on a short-ton basis. East of Rochester all bituminous is sold on a long-ton basis.

Anthracite—There has been a steady improvement in the demand lately. Local retailers find that business is practically up to normal and likely to remain so far the rest of the season. It will take sometime to make up the lost tonnage, but the demand for chestnut is again very insistent. The other sizes are not so active, there being a wide difference between chestnut and stove. The through rail demand does not increase as fast as it should at this time of the year even with the shortage of cars.

There is now no difference in the company circular and the independents prices, all getting uniformly into line for winter. The circular for Buffalo is $5.60 for grate, $5.85 for egg and stove, $6.10 for chestnut, $4.30 for pea, $3.25 for buckwheat, $2.75 for rice and $2.50 for barley, all f.o.b. on cars, with 25c. additional for delivering on board vessels.

Lake rates are strong to Lake Michigan on account of the fleet going to Lake Superior for wheat. Milwaukee now pays 50c. which is an advance of 10c. Shipments for the week were 128,500 tons; for the month of October, 521,171 tons; for the season to November, 3,313,246 tons, as compared with 3,695,021 tons last season.

TORONTO, CAN.

Mild weather interferes with anthracite movement but bituminous shows improving tendency.

The domestic demand for anthracite is less than usual owing to continued mild weather. There is some improvement in the demand for bituminous, as manufacturing in many lines is showing increased activity. The shortage of cars is still retarding deliveries, and while there are generally plentiful stocks of all other grades, slack continues scarce. Quotations per short ton for best grades are as follows: Retail, anthracite egg, stove and nut, $7.75; grate, $7.50; pea, $6.50. Bituminous, retail, steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $8. Wholesale f.o.b. cars at destination, three-quarter lump, $3.79; screenings, $3.15.

COLUMBUS

Steam business continues strong while domestic is a little slow, due to warm weather. Circular well maintained. Prospects for the future are good.

Manufacturing in every line is still expanding and the fuel requisitions are growing larger. The expansion is not confined to iron and steel concerns but is noted in general lines of manufacturing. The tone of the market is correspondingly improved and prospects for the future continue bright.

The domestic demand is a little slow because of unfavorable weather. But reports show that stocks in the hands of retailers are not large and with a cold snap, business will undoubtedly show considerable activity. Holding up of shipments has been requested in a number of instances, but actual cancellations of orders are not common and retail prices are ruling firm.

Lake trade is attracting considerable attention and chartering of bottoms is going on actively though prices are high. There will be activity in the Lake trade right up to the close of navigation.

Car shortage is growing worse as the winter approaches. This is especially true on the Chesapeake & Ohio and the Baltimore & Ohio. Other roads are also feeling the shortage. Circular prices are generally well maintained. There is a good demand for the small sizes because of the lessened supply.

Prices in Ohio fields f.o.b. mines, per short ton, are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.60	$1.65	.....	.....
Inch and a quarter	1.50	1.50	$1.35	$1.50
Three-quarter-inch	1.35	1.40	.....	1.35
Nut	1.25	1.30	.....	1.25
Mine-run	1.15	1.20	1.05	1.10
Nut, pea and slack	.70	.75	.65	.60
Coarse slack	.60	.65	.55	.50

Mines have been working at about the following percentages of full capacity:

District	Week Ended				District	Week Ended			
	Oct. 16	Oct. 23	Oct. 30	Nov. 5		Oct. 16	Oct. 23	Oct. 30	Nov. 5
Hocking	55	60	65	60	Cambridge	60	60	65	70
Jackson	40	60	50	45	Massillon	60	45	70	70
Pomeroy	85	65	90	85	Eastern O.	85	85	80	80
Crooksville	50	85	65	65		—	—	—	—
					Average	62	65	69	67

CLEVELAND

Demand keeps up fairly well, but warm weather retards activities. Supply of coal becomes limited in some lines. Market generally up.

Two kinds of coal are practically out of the market here. Fairmount grades are too expensive as they have been for weeks and Youghiogheny slack is really scarce. Jobbers reported this week they could not buy large tonnages for immediate delivery and had to pay 90c. a ton at the mines for a few cars at a time. The supply of coal is being kept down as factories are laying in somewhat larger stocks. The late shipping to the Lakes is now under way, and as regular shipments cannot be counted on after Nov. 20, operators are giving as much coal to the Lake trade as it will stand. Although Lake shipments are not as large as usual, they are heavier than a few weeks ago.

Bergholz and Massillon mines are behind on their orders of domestic sizes. The dealers did not do much buying early in the fall and when they did come in the operators were given more business than they could fill immediately. There has been no cold weather to force domestic buying, but the trade is fair and steady. A turn of cold weather would bring a rush of orders that would swamp the retailers for a few weeks.

The market generally is up with jobbers paying the following prices f.o.b. Cleveland per short ton:

	Pocahontas	Youghiogheny	Fairmont	Bergholz	Ohio No. 8
Freight rate......	$1.45	$1.00	$1.15	$0.70	$0.90
Lump............	3.60				
Lump, 6-in........				2.30	
Lump, 1¼-in.......		2.40		2.10	2.15
Lump, ¾-in.......		2.30	2.15	2.00	1.95
Egg..............	3.60				
Egg, 6-in				1.90	
Mine run.........	2.75	2.15	2.05	1.90	1.85
Slack............		1.90	2.00@2.05	1.70	1.70

TOLEDO

Pocahontas strong and lake shipments show advance for season. Steam coal strengthening. Car shortage becoming more apparent.

There is a better call for domestic coal and the steam grades are again coming into stronger demand. The close of navigation is now in sight and everybody is running their final shipments of Lake coal through as rapidly as possible. The car shortage has become quite apparent and it is already difficult to secure sufficient gondola cars. The Lake shipping has not been heavy this season although all of the docks have been pretty heavily rushed lately.

Pocahontas is keeping up well and the circular is being closely maintained. The mine price per short ton on Pocahontas lump and egg is firm at $2.25. Nut is bringing $1.75 while slack is quoted at $1.25 and is very short due to the heavy demand from the steel mills. Domestic trade generally is not so strong because of the continued warm weather but steam coal is moving well. The car shortage is beginning to be generally felt although no serious situations have as yet developed.

DETROIT

Domestic trade feels stimulus of colder weather. Steam coal more active. Anthracite demand improves. Lake trade approaching the end.

Bituminous—Following a lapse in demand during the past two weeks, steam coal is again showing signs of increased activity. Orders are appearing more frequently, though the amount taken is usually not very large. Continued activity of industrial plants, with increasing production in some instances, adds encouraging basis for the belief that the improvement will be maintained.

Orders for domestic sizes are also more frequent with the coming of lower temperatures but shippers and jobbers have not benefited much as yet. Little consignment coal is now in evidence, lump and egg sizes being the most plentiful with occassional sacrifice sales. Prices generally are holding steady. Complaints of car shortage in some of the mining districts are more numerous, but the condition has caused little trouble as yet.

Anthracite—There is fair activity in distribution of anthracite from retail yards, though the dealers seem to have adequate supplies for the time being. Car shortage on Eastern lines may become an important factor in the situation later.

CINCINNATI

Continued scarcity of cars is the leading factor in the market. Demand still relatively sluggish, due to mild weather. Prices steady.

The shortage of cars, the supply averaging only about 33 to 40% of requirements, has held the market and had a stimulating effect on business. Except for this the trade would be almost back to the summer dullness. The retail trade is taking very little coal, and the industrial demand has not increased, so that the scarcity of cars has not caused any anxiety among consumers. This is worrying the trade considerably, however, as the demand is certain to be heavy when a cold snap comes. Prices are stiffening, and bid fair to be much higher.

LOUISVILLE

Warm weather depresses the market but the outlook is considered favorable. Car supply somewhat better.

Continued abnormally mild weather is exerting a depressing influence on the domestic market. Dealers are stocking more readily, however, and shipments have been somewhat better. The car shortage eased up a little and gave the Eastern Kentucky mines an extra day during the week. The steam coal sales are somewhat brisker and the outlook in both classes is considered good.

Sales have been made during the week, f.o.b. mines, long ton basis, at from $1.75 to $2.10 or $2.15 on Eastern Kentucky block with steam nut and slack continuing to sell around 40 to 50, and 70 to 75c., according to grade. The Western Kentucky market is still around $1.25 for lump while the prices on pea and slack are variable.

BIRMINGHAM

Business continues to slowly improve. Heavy movement of river coal.

While business is not picking up as rapidly as hoped for still conditions are better than they have been for the past two years, both on steam and lump coal, and the prospects for a steady improvement during the coming fall and winter are exceedingly good. Prices are holding up well and collections are better than at any time in the past two or three years. River coal is moving in large quantities to Mobile and New Orleans, and while this is effecting the all-rail mines to some extent, the tonnage moving from the latter is far in excess of that for the same period last year.

COKE

CONNELLSVILLE

Prompt furnace coke easier. Some business for next year. Prompt and foundry coke stiffer, with good prospects. Production and shipments increased further.

The pressure for prompt furnace coke seems to have ended late last week, producing an easier market even then, while this week demand is very light and no definite market has been developed. This week's outside price is not above last week's inside price. Contract furnace coke is not moving very rapidly, unless more business has been closed than appears on the surface. One contract has been closed for 10,000 tons a month over 1916 at $2.25 flat, but the market for the early months is above this, while for the late months coke is expected to be cheaper as so many byproduct ovens are to be completed in the second quarter of next year.

Foundry coke is stronger and operators are very firm in their views as, considering the likelihood of box cars being very scarce, and prospects of increased foundry operations, the foundry coke market shows promise of being able to take care of itself better than the furnace coke market. We quote: Prompt furnace, $2.40@2.50; contract furnace, first half, $2.35@2.50; year 1916, $2.25@2.35; prompt foundry, $3@3.25; contract foundry, first half, $3@3.25, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 30 at 432,519 tons, an increase of 4,200 tons, and shipments at 441,911 tons, an increase of 4,363 tons.

Buffalo—There is the same feverish activity in coke. So many prices are quoted to stave off orders that it is not easy to obtain an authentic one. Jobbers are paying all the way from $4.85 to $5 for best 72-hr. Connellsville foundry. Stock coke is practically out of the market, the quotation being about $4.10.

Columbus—Coke demand is strong and prices have advanced about $1 per ton during the past 60 days. Pocahontas is moving well and the same is true of White and Red Ash. Anthracite is also in better demand.

Birmingham—There is nothing new in the coke market for the past week. The demand from the furnace companies continues steady and furnace coke is finding a good market at satisfactory prices.

MIDDLE WESTERN

ST. LOUIS

High temperatures depress the market. Prices show a softening tendency.

Under the influence of high temperature there has been marked dullness during the week. A determined effort is being made to prevent rate demoralization and in the main the prices are holding but some who were forced to move Standard during the week let No. 6 lump and No. 2 lump go at 5 and 10c. less than the quotations. Reduced output has stimulated the price of screenings.

Quotations f.o.b. mines during the past week have ranged on the following basis per short ton:

	Frnk. Co.	Wlmson. Co.	Staunton	Standard
6-in. lump	$1.50@1.75	$1.50@1.75	$1.25@1.35	$1.20@1.25
8-in. lump	....	....	....	1.25
2-in. lump	....	....	1.15@1.20	1.10
3x6 egg	1.40@1.75	1.40@1.65	....	1.00
2x6 egg	....	....	....	.80@.85
No. 1 nut	1.50@1.75	1.50@1.75	....	.80
No. 2 nut	1.40@1.50	1.40@1.50	....	.60
No 1 washed	....	1.65	1.50	....
No 2 washed	....	1.25	1.10@1.25	....
No. 3 washed	....	1.25	1.00@1.25	....
No. 4 washed	....	1.20	1.05	....
No. 5 washed	....	.60@.70	.50@.60	....
Screenings	.60@.65	.60@.65	.25@.35	.25@.35

DULUTH

Moderate weather causes a lull in shipments. No increase in receipts. Prices remain stationary.

The extraordinary mild weather for this time of year has caused a slight falling off in shipments. Agencies that cater to the dealer and retail trade report a temporary lull in the demand for coal. The inquiry from steam users and the railroads is well up to the average and no complaint is heard regarding this class of business. Receipts show no material changes from last week. Quotations per short ton f.o.b. cars, docks, Duluth, are as follows:

	Yough	Splint	Hock	Smokeless	Elkhorn
Lump	$3.40	$3.40	$3.40	$4.75	$3.75
Dock run	3.10	3.10	3.05	3.25	3.25
Stove or nut	3.40	3.40	3.40	4.75	3.65
Screenings	2.40	2.40	2.25	2.75	2.40

In spite of the very mild weather a fair volume of business is being done in the anthracite trade. The householder is laying away a few tons in anticipation of a cold snap in the very near future, and as a result the dealers and retailers report that the domestic demand is well maintained. Quotations per short ton f.o.b. cars, docks, Duluth, are as follows: Egg and stove, $6.85; nut, $7.10; pea, $5.55 and buckwheat, $4.

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

The shipments of anthracite as reported to the Anthracite Bureau of Information amounted in October to 6,505,892 long tons. This showed an increase over the preceding month of September of 987,121 tons, but was still 138,584 tons short of the shipments in October, 1914.

The total shipments for the first ten months of 1915 amounted to 53,885,003 tons, against 56,712,057 tons in 1914, a decrease so far this year of 2,827,054 tons.

The shipments for October include all the coal moved from the breakers or washeries. In previous statements a relatively unimportant quantity put into storage by one of the transportation companies was not included.

Anthracite shipments for October and the first ten months of 1914-15 were as follows:

	October		10 Months	
	1915	1914	1915	1914
Phila. & Reading	1,199,284	1,092,056	9,195,089	9,961,608
Lehigh Valley	1,266,539	1,391,144	10,714,002	10,941,943
Cent. R.R. of N.J	895,895	892,386	6,532,694	7,452,435
Del. Lack. & West	888,609	990,570	7,679,800	8,128,793
Del. & Hudson	701,279	678,104	6,671,603	6,032,697
Pennsylvania	637,052	611,593	4,870,961	5,308,918
Erie	708,007	773,866	6,524,667	6,943,394
Ont. & Western	209,227	214,757	1,696,187	1,942,269
	6,505,892	6,644,476	53,885,003	56,712,057

Stocks at Tidewater Oct. 31 were 625,821 tons.

NEW YORK EXPORTS

The value of the fuel exports from New York for September were as follows:

Anthracite		Bituminous		Coke	
Canada	$72,608	Canada	$483	Italy	$12,720
Guatemala	22	Mexico	1,005	Norway	7,800

I. C. C. DECISIONS

I. C. C. Nos. 4,705, 6,526, 4,875—Coal Switching Reparation Cases at Chicago.

Upon presentation of the issue whether or not complainants have been damaged and are entitled to reparation because of the payment of charges on carload shipments of coal, **Held:**

1. That complainants in Gilmore & Co. v. C. & N. W. Ry. Co. and in Hinners Co. v. N. & W. Ry. Co. have not proven that they were damaged by the payment of charges which were found to be unjustly discriminatory. In a discrimination case the measure of damage is not the difference between the two rates, but is a fact that must be proven with the same definiteness as would warrant a judgment in a court of law.

2. That complainants in Lill & Co. v. C., M. & St. P. Ry. Co. have been damaged and are entitled to reparation to the extent of 10 cents per ton on certain shipments and 5 cents per ton on others because of charges which were found to be unreasonable. No damage proven on that part of the charges which was found to be unjustly discriminatory.

I. C. C. No. 7261—American Coal & Coke Co. vs. Michigan Central R.R. Co.

On complaint that defendant unjustly discriminates against and unduly prejudices complainant by refusal to extend credit to it with respect to freight and demurrage charges accrued on carloads of coal held at Windsor, Canada, and Detroit, Mich., while extending credit to competitors under like circumstances: **Held,** That the evidence fails to show that complainant is discriminated against or prejudiced within the meaning of the act.

FOREIGN MARKETS

GREAT BRITAIN

Oct. 22—The scarcity of tonnage is more pronounced. Coal stocks are excessive and prices weak. Quotations are nominally as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$4.44
Best seconds	Nominal	Seconds	4.32
Seconds	$4.44	Best Cardiff smalls	2.76
Best dry coals	5.64	Cargo smalls	1.92

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusively of wharfage.

Freight—Chartering is restricted owing to tonnage scarcity. Rates all round continue very firm and are approximately as follows:

Gibraltar	$6.72	Naples	$9.60	St. Vincent	$7.80
Marseilles	9.65	Alexandria	11.16	River Plate	10.20
Algiers	7.72	Port Said	11.16		
Genoa	9.60	Las Palmas	6.60		

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
1576	Lane Cotton Mills	New Orleans	La.	50 (cars)	700
1579	Cosmopolitan Hotel	New Orleans	La.	120 tons[1]	700
1603	Springfield Santr.	Krumroy Sta.	Ohio	15,000b	737
1605	State Capitol	Frankfort	Ky.		737
1622	City Government	Spokane	Wash.	600[2]	787

b Indicates bituminous. [1] Per month. [2] Carload lots.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

+1356—Storm Lake, Iowa.—This contract (p. 411), providing for furnishing the local light and water department with coal during the ensuing year has not yet been let, the plant having changed hands, now being owned by a Boston firm—Hooper, Kimball & Williams. This contract involves approximately $5,700 worth of coal. Address Dist. Mgr. C. H. Utter, Grinnell, Iowa.

1551—East St. Louis, Ill.—Swift & Co. have not yet decided whether to close this contract (p. 660) or continue purchases in the open market as they have been doing for the past several months. Address Pur. Agt. H. C. Huggins, Swift & Co., East St. Louis, Ill.

1557—East St. Louis, Ill.—Purchases on this contract (p. 661), which provides for furnishing Morris & Co. with approximately three or four cars of screenings per day are still being confined to the open market, though a contract may be let later. Address Pur. Agt. L. Chakes, Morris & Co., East St. Louis, Ill.

+1569—Winner, S. D.—This contract (p. 699), which provides for furnishing bituminous coal, as may be required at the local Court House during the coming winter, was bid on as follows: Montgomery Lumber Co., $9.50; James A. Smith Lumber Co., $9; Floete Lumber Co., $8.50. Address Audr. F. E. Wells, Winner, S. D.

1573—Philadelphia, Penn.—Bids on this contract (p. 699, see also contract 1516, pp. 577, 660), calling for additional supplies on a deficiency contract until the end of the present year, were as follows: Belmont Pumping Station, 6,900 tons pea, Smith, Lineaweaver & Co., $3.47; Belmont Pumping Station, 6,900 tons pea, Susquehanna Coal Co., $3.47; Queen Lane Filters, 300 tons pea, Philadelphia & Reading Coal and Iron Co., $4.11; Spring Garden Pumping Station, 100 tons pea, Philadelphia & Reading Coal and Iron Co., $3.48; Queen Lane Pumping Station, 7,400 tons buckwheat, Philadelphia & Reading Coal and Iron Co., $2.72; Roxborough Auxiliary, 1,000 tons buckwheat, Philadelphia & Reading Coal and Iron Co., $3.11; Belmont Pumping Station, 2,300 tons buckwheat, Susquehanna Coal Co., $2.43; Lardner's Point Pumping Station, 17,000 tons buckwheat, Emmons Coal Mining Co., $3.04. Address Dir. Herman Loeb, Dept. of Supplies, Philadelphia, Penn.

+1583—New York.—Bids have been received on this contract (p. 700), which provides for furnishing the Department of Docks and Ferries with approximately 2,000 tons of No. 3 buckwheat for the Borough of Richmond, as follows: Pattison & Brown, $1.97; Joseph P. O'Connor, $2. The contract has not yet been awarded. Address Comr. R. A. C. Smith, Pier "A," New York.

1584—New Orleans, La.—This contract (p. 700), which provides for furnishing William Henderson with approximately 50,000 tons of coal will be closed some time in December. Address William Henderson, 749 South Peters St., New Orleans, La.

+1585—Montclair, N. J.—This contract (p. 700), which provides for furnishing the Montclair School with 600 tons of pea and 70 tons of stove coal has not yet been awarded there being only one bidder and the state laws prohibiting closing the contract under this condition. Formal request has been made to continue purchases in the open market which is expected will be granted. Address Chn. Melvin A. Rice, Normal School Committee, State House, Trenton, N. J.

New Business

1624—Louisville, Ky.—The Southern Brick and Tile Co., at this place will contract some time in December for their annual requirements of coal involving 5,000 tons of nut and slack, 1,500 tons of nut, and 1,000 tons of mine-run. The company has a storage capacity of 3,000 tons, and deliveries are made by railroad at the rate of about 25 tons per day. Address Pur. Agt. T. Bishops, 13th and Ormsby St., Louisville, Ky.

+1625—Marshall, Minn.—Bids were received until 7.30 p.m., Nov. 8, for furnishing the City Power Plant with approximately 1,800 tons of any of the following grades of coal: Franklin County 2-in. screenings; Miller Creek 2-in. screenings; West Virginia White Ash Splint, 2-in. screenings; Youghiogheny (thin vein) 2-in. screenings; Carterville Washed nut; General Wilmington Washed Carbon; Semi-anthracite 2-in. screenings. Deliveries are to be in carload lots on the sidetrack at the city power plant near the C. and N. W. R.R. Address Recorder T. L. Bumford, Marshall, Minn.

+1626—New York, N. Y.—The Board of Trustees of the Bellevue and Allied Hospitals will receive bids until noon Nov. 15, for furnishing and delivering approximately 3,000 gross tons of buckwheat No. 1. Delivery is to be completed by Dec. 31. For details concerning the bids and award on the previous contract see No. 1415, pp. 448 and 662. Address Auditor, Board of Trustees, Bellevue and Allied Hospitals, 400 East 29th St., New York City.

+1627—Belfield, N. D.—The Board of County Commissioners at this place will receive bids until 2.30 p.m. Nov. 15, for furnishing either lignite or Western bituminous coal, as may be required at the local court house during the ensuing year. Successful bidder will be required to furnish a bond for $400. Address County Aud. J. L. Hughes, Belfield, N. D.

+1628—Newark, N. J.—Bids will be received between 2.30 and 3 p.m., Nov. 22, for furnishing the Newark City Hall at Verona with approximately 1,000 gross tons of pea coal. Complete details may be had on application. Address Secy., Carl Heller, Mayor's Office, City Hall, Newark, N. J.

+1629—Beach, N. D.—The Beach School Dist. No. 3 received bids until 8 p.m., Nov. 3, for furnishing coal as may be require at the local School Houses during the ensuing year. All bids were to be f.o.b. track at Beach. Address Clk. C. O. Halvorson, Beach School Dist. No. 3, Beach, N. D.

1630—Buffalo, N. Y.—G. Elias & Bro., Inc., require about 1,000 tons of coal during December, January, February and March. The company has no contract. Deliveries are made by railroad at the rate of 250 tons per month. Address Pur. Agt. I. Gillespie, G. Elias & Bro., Inc., 965 Elk St., Buffalo, N. Y.

1631—Council Bluffs, Iowa.—The City Council received bids until 7:30 p.m., Nov. 1, for furnishing coal as may be required during the coming season. Bids were requested on Centerville, Iowa, 8-in. lump, Nokomis 1¼-in. lump, Witt 1¼-in. lump, Hillsboro 1¼-in. lump, Taylor Springs 1¼-in. lump, Lehigh Valley anthracite range and egg coal. All bids were to be accompanied by a certified check for $100. Address City Clk. Charles J. Duff, Council Bluffs, Iowa.

+1632—Greenville, Ohio—The Darke County Board of Commissioners will receive bids until 10 a.m., Nov. 13, for furnishing approximately 100 tons of Pocahontas lump coal, f.o.b. cars, P. C. C. & St. L. sidetracks at Greenville. A deposit of

$25 must accompany each bid. Address Clk. G. H. Garrison, Darke County Board of Commissioners, Greenville, Ohio.

+1633—New York, N. Y.—The Central Purchasing Committee will receive bids until Nov. 22 for furnishing and delivering 10,000 tons of anthracite coal to the departments of Corrections, Public Charities, Parks (in Brooklyn) Fire, Water Supply, Gas and Electricity. Address Central Purchasing Committee, Room 1226 Municipal Bldg., New York City.

Contracts Awarded

Note—Successful bidders are noted in **bold face type.**

1361—Davenport, Iowa.—This contract (pp. 411, 616), which provides for furnishing the fuel requirements of the Moline Rock Island Manufacturing Co. and the Tri-City Railway and Light Co., was awarded to the **Alden Coal Co.** of Davenport, and the **Spoon River Coal Co.,** of Rock Island, Ill. The combined companies consume approximately 75,000 tons of 1¼-in. screenings per annum. Address Pur. Agt. George G. Kuhn, Moline Rock Island Mfg. Co., Davenport, Iowa.

+1423—Topeka, Kan.—The tonnage involved on this contract (pp. 489, 662), awarded to the **Southwestern Coal Co.,** is 2,400 tons instead of 400 tons as previously noted. Address Supt. E. G. Stahl, Municipal Electric Light Dept., Topeka, Kan.

+1496—Virginia, Minn.—This contract (p. 577), which provides for furnishing the City Government with approximately 100 tons of either Pocahontas or anthracite buckwheat, egg, nut or stove coal, has been awarded to **Johnson & Peterson.** Address City Clk. Albert E. Bickford, Virginia, Minn.

+1506—Trenton, N. J.—This contract (p. 577), which provides for furnishing the New Jersey State Prison with coal as may be required at different camps during the ensuing year has been awarded to **Max Feinshein** as follows: Bituminous, $3.35; broken, $5.35; stove, $6.30. Address Fiscal Agt. J. P. McCormack, State Prison, Trenton, N. J.

+1544—Nebraska City, Neb.—This contract (p. 617), which provides for furnishing the Otoe County Board of Commissioners with approximately 140 tons of coal, has been awarded to the **Otoe Lumber Co.,** at $3.96 per ton for Missouri screened soft coal. Address County Clk. Louis J. Stutt, Nebraska City, Neb.

+1556—Youngstown, Ohio—This contract (p. 661), which provides for furnishing the Mahoning County Commissioners with three-quarter inch screened coal as may be required at the Court House and Jail during the ensuing year, has been awarded to the **Youngstown Coal and Supply Co.** at $2.35 per ton. Address Clk. Frank H. Vogan, Mahoning County Comrs., Youngstown, Ohio.

1579—New Orleans, La.—This contract (p. 700), which provides for furnishing the Cosmopolitan Hotel with approximately 120 tons of coal per month, has been awarded. Address Major Stewart, Cosmopolitan Hotel, 120 Bourbon St., New Orleans, La.

1582—Erie, Penn.—This contract (p. 700), which provides for furnishing approximately 25 cars of three-quarter screened Pittsburgh lump coal, has been awarded to **E. J. Gebhardt** at $1.95 per ton. Address County Controller, Joseph E. Leslie, Erie, Penn.

1587—Jeanette, Penn.—This contract (p. 700), which provides for furnishing the Jeanette Borough School District with coal as may be required during the ensuing year, has been awarded to the **Westmoreland Coal Co.** at $1.40 per gross ton for mine-run coal f.o.b. mines. Address Secy. J. V. Rovensky, Jeanette Borough School Dist., Jeanette, Penn.

+1595—Hollidaysburg, Penn.—This contract (p. 736), which provides for furnishing the county government with coal has been awarded to the **Thermic Coal and Supply Co.,** on their "E" Vein bituminous coal as follows: 700 tons for delivery at the heating plant in the jail yard, $1.99; 80 tons for delivery at the Williamsburg Training School, $2.50. Address County Consumer, P. W. Tobias, Blair County, Hollidaysburg, Penn.

1596—Kenmare, N. D.—This contract (p. 736), which provides for furnishing coal for the various City Departments as may be required during the ensuing year, has been awarded to **Jonas Johnson,** at $2.65 per ton for lignite coal delivered. Address City Audr. Evan Griffith, Kenmare, N. D.

Contract Notes

Philip, S. D.—The bid of the Atlas Lumber Co. to furnish hard coal for Haakon County was accepted at $13.25 per ton.

Mankato, Minn.—Contract for furnishing the local jail, court house and poor farm with coal during the ensuing year has been awarded to **S. K. Fowler** at $5.75 for Island Creek splint coal.

Wibaux, Mont.—The contract for furnishing the local County Government with coal during the ensuing year has been awarded to the **Midland Coal and Lumber Co.** Address County Cl. J. R. Chappell, Wibaux, Mont.

Danbury, Conn.—On the contract for furnishing the City Hall with approximately 100 tons of egg coal, E. C. Marsh & Co., bid $7 per short ton, including cost of delivery. Address Chn. A. H. Fillow, City Hall, Danbury, Conn.

Springfield, Mo.—A contract has been let by the county commissioners of Greene County, for the coal supply for the court house and county jail, until Sept. 1, 1916, to the **Merchant's Ice and Fuel Co.,** of Springfield, at $3.40 a ton, delivered, for Kansas deep shaft coal.

Philadelphia, Penn.—C. J. Milne & Sons, at this place, consume about 2,000 tons of bituminous coal per annum, deliveries being made on the railroad siding at their plant. They have a storage capacity of 150 tons. Address the Purchasing Agent, C. J. Milne & Sons, 11th and Washington Ave., Philadelphia, Penn.

Philadelphia, Penn.—Pecora Paint Co., at this place, consumes about 600 tons of anthracite coal per annum. They have storage capacity for 100 tons, and deliveries are made by railroad at the rate of about 50 tons per month. Address Pur. Agt. F. B. Bowen, Pecora Paint Co., 4th and Venango St., Philadelphia, Penn.

Troy, N. Y.—The Aird-Don Co. at this place consume approximately 250 tons of bituminous coal per annum, deliveries being made by railroad and wagon at the rate of about one car a month. They have storage capacity for about 25 tons. Address Pur. Agt. Thomas C. Boswell, care of Aird-Don Co., 411 River St., Troy, N. Y.

Philadelphia, Penn.—The anthracite shippers in this territory are understood to be quietly notifying their contract customers that owing to possible trouble in the region on Apr. 1 no contracts will be made on Jan. 1, at which time most anthracite contracts expire, but that the old contracts will be carried over until Mar. 31, 1916.

Louisville, Ky.—Sam D. Jones, business manager for the Board of Education of the public schools of Louisville, is considering making use of natural gas in the heating plants of the public school buildings, in place of coal which is now used. General installation of gas heating plants will not be possible at the outset because the service pipes of the Louisville Gas and Electric Co. are not available for more than a few of the schools. For bids and award on the school contract see contract 730, Vol. 7, p. 916, Vol. 8, p. 78.

New York—By purchasing their coal supply through the Central Purchasing Committee, 28 city departments have been able to buy at reduced prices. According to a recent report of the Committee there has been an average reduction of 2.7c. in the price of chestnut coal, 31.6c. in the price of buckwheat No. 3 and 40c. in mine-run. The committee has purchased during the present year 269,199 gross tons of coal and the average price of chestnut coal was $6.544 per gross ton as against $6.571 paid in 1914; buckwheat No. 3, $2.351 per gross ton as against $2.667 and for mine-run $3.136 per gross ton as against $3.536 per gross ton paid in 1914.

Foreign Notes

Brazil—An American consular officer in Brazil reports that a firm in his district desires prices for charter shipments, f.o.b. New York or other water points, on coal. Statements of analyses should be sent.

Portugal.—Prices of coal in Portugal, already double what they were before the war, are gradually increasing, and the supply of fuel on hand is very small. The latest quotations for Welsh coal are $10.20 to $10.70 and $11.90 to $12.90 c.i.f. Lisbon. Lower qualities bring $9.25 to $9.50. The English freight rate is also advancing and is now $4.15 to $4.85 a ton. It is admitted that America could supply this market if freights from the United States were around $4.85 to $6.10 per ton.

Italy.—The British steamship Washington has been chartered to carry a cargo of 7,000 tons of coke to Italy. The vessel is now loading its cargo at the Port Richmond piers of the Philadelphia & Reading Ry. at Philadelphia. The coke has been furnished by the Public Service Corporation, Camden, N. J., from their byproduct coke ovens. The shipment of American coke to a foreign port is exceptional and is brought about by the fact that supplies are no longer available from Germany. The one great objection to increasing shipments is due to the scarcity of vessels and the high rate of freight, which in the present instance represents a value three times greater than the cargo.

Financial Department

Pond Creek Coal Co.

President T. B. Davis reports for the year ended Dec. 31, 1914, as follows:

The total production of coal for the year amounted to 690,653 tons, an increase of 160,104 tons over 1913. Although the company was only in its second year, it had been hoped that a larger production would be reached; but conditions arose which made this impossible. The coal produced finds an important market as a byproduct coking coal, and consequently is, to a considerable extent, dependent upon conditions in the steel industry.

After the first few months of the year, when the company did not earn its bond interest, earnings improved, so that for several months fairly substantial profits above interest were being made until the severe depression of business in the fall occurred, curtailing the output to an extent that made it impossible to earn the bond interest. We have every confidence that with an increase in the output, which is to be looked for on a return of better conditions, the company will earn substantial profits above charges.

Net additions to capital account, amounting to $158,004, were made during the year, and these cover principally the cost of completing tenement houses of which the company now owns 629, the cost of completing 15 better class houses, 4 store buildings, and other expenditures. The equipment additions cover principally the cost of 6 mining machines, 14 gathering locomotives, 350 steel mine cars, 2 refrigerating machines for the stores, etc. No depreciation has been set aside this year. When the development of the property is further advanced, this matter will be carefully considered, with a view to fixing a rate which will be sufficient to cover the depreciation on your plants.

INCOME ACCOUNT FOR YEAR ENDING DEC. 31, 1914

Gross earnings	$104,137	Gross income	$100,544
Net earnings	80,497	Bond interest	120,000
Other income	20,047	Balance, deficit, for year	19,456

Island Creek Coal Co.

Pres. Thos. B. Davis, reports for the year ended Dec. 31, 1914, as follows:

Our production during 1914 amounted to 2,207,444 tons, an increase of 291,344 tons over 1913. Market conditions were not altogether satisfactory at any time of the year, and especially during the last half, when, due to the war in Europe, business generally was, as a matter of course, considerably unsettled, a reaction unfavorable to the coal business set in, which doubtless reduced the total amount of coal that otherwise would have been produced at your properties. In spite, however, of existing conditions, the net profits increased by $193,808 to a total of $823,481, the highest amount yet reached.

In order to increase our production, it was decided to open up two new mines, Nos. 11 and 12, on Main Island Creek. To provide power for these new mines, and also to allow of a greater production at certain of the other mines now in operation, it became necessary to make additions to the power system. These additions now completed, include two 400-hp boilers, a 1000-kw. turbo generator set and auxiliary equipment, two 600-kw. sub-stations and equipment, 500 steel mine cars, eight 6-ton gathering locomotives, over two miles of railroad sidings for the new mines, two steel tipples and equipment, 23 complete and 15 partially completed dwelling houses, store building, mining machines, etc.

To improve our river plant at Sekitan, Ohio, a large part of the old plant was replaced by a new plant which will have greater capacity than the old equipment, and very much improved facilities, together with additions to the dry docks and floating equipment. The total amount of all expenditures capitalized, after deduction of the cost of structures replaced by new works and charged to depreciation fund, amounted to $376,550. Additions were made to the depreciation fund on the same liberal basis as previously, and a large amount was charged against the depreciation fund, representing additions and betterments, which it was thought desirable not to capitalize, such as new steel mine cars, to replace wooden cars, reconstruction of a number of mine cars, storage tracks in the mines, two steel bridges, strengthening trestle, etc. Depreciation and reserve funds have decreased by $50,511, due to the large amounts charged against these funds as above mentioned, which exceeded the additions thereto.

Dividends on the preferred stock at the rate of $6 per share per year and ordinary dividends on common stock at the rate of $2 per share per year, as well as an extra dividend on the common stock of $3 per share, were paid during the year 1914. The extra dividend is a distribution of accumulated surplus.

CONSOLIDATED EARNINGS STATEMENT YEARS ENDING DEC. 31

	1914	1913	1912
Net earnings	$1,008,388	$800,448	$811,048
Reserve for exting. and depreciation	119,672	106,047	95,357
Net profits	$888,716	$694,401	$715,691
Administration and general expenses	69,480	70,392	57,253
Balance	$819,236	$624,009	$658,438
Add—Int. on bank deposits, etc	4,245	5,663	18,694
Total net profits	$823,481	$629,672	$677,132
Preferred dividends	$298,872	$298,754	$298,659
Common dividends	562,711	530,943	401,280
Balance deficit	$38,102	$200,025	$22,807

CONSOLIDATED BALANCE SHEET DEC. 31 (INCL. SUBSIDIARIES)

Assets—	1914	1913	Liabilities	1914	1913
Property account	$5,470,791	$5,094,241	Stock (not par—see below)	x$4,502,355	$4,493,974
Bond redemption fund	....	3,150	Cap. stk. of U. S. C. & Oil Co. not held	13,125	15,325
Cash	364,399	731,787

Coal in transit and in storage	525,450	299,421	Current liabilities	y183,229	150,274
Materials and supplies	254,658	210,000	Dividend paid Jan. 1	74,727	74,691
Unexpired insurance, prem. paid, taxes, etc.	24,669	32,771	Premium on shares of com. stock	905,520	602,651
			Deprec., etc., funds	459,874	510,385
			Undiv. sur. (sub. cos.) z	2,164	1,653
			Surplus	810,694	848,796
Total	7,039,297	6,797,874	Total	7,039,297	6,797,874

x Includes 49,820 15-18 shares pref. and 99,641 12-18 shares common stock issued in exchange for 179,355 shares of stock of U. S. Coal & Oil Co. par value of which is $4,483,875, and 18,480 shares common issued for cash, par value $18,480; total, $4,502,355.

y Current liabilities include accounts payable, $115,261; accrued pay-rolls, $16,580; drafts in transit, $24,392; accrued taxes, $26,995.

z Applicable to stocks not held by the Island Creek Coal Co.

Note—For previous annual report of this company see Vol. 6, p. 252.

Delaware, Lackawanna and Western

The annual report for the year ended Dec. 31, 1914, says:

Our coal mining operations resulted in producing 9,050,076 tons of coal from collieries and washeries, or 206,013 tons more than in any previous year.

Extraordinary expenditures aggregated $778,553, notably $285,959 for development of the new Loomis Colliery and $121,864 for opening up and developing of new Laurel Run property. These developments should, by the latter part of 1915, turn out a substantial tonnage each, and when completed will add largely to our total capacity of production. The further development of the Truesdale Colliery by the introduction of electrical and other machinery, pumps, etc., required a large expenditure, viz.: $124,402; this colliery is now the largest single producer in the anthracite fields, its tonnage last year amounting to 1,152,100 tons.

COAL AGE

Vol. 8 NEW YORK, NOVEMBER 20, 1915 No. 21

A Word About Our Wives

The women of our mining camps are slowly but surely coming into their own.

IT'S a long jump from the daily bath that the average coal digger used to take in his kitchen (using a tub filled with water heated by his wife on the family cookstove, the water being carried to the house a block or two by her from the nearest hydrant or well) to the daily bath that the miner now gets in a modern bathhouse a few steps away from the pit mouth, but some distance from home. The one who appreciates the change most and yet was never consulted in the matter is the same wife who once upon a time carried the water to fill the family tub.

And it's a still longer jump from the leaky, ramshackle shanties of yesterday to the neat, convenient dwellings of many mining camps today, and here again only the wives realize the completeness of the change.

The miner underground at his working face has no need to worry about the rain that laughs at the leaky roof on his dwelling, and if perchance it should rain when he is home at night, he is more than apt to be so sleepy that he will forget the unpleasantness before morning.

Likewise the patches of paint, still clinging desperately to his dwelling as a sort of reminder of a coat of paint that has long since outlived its usefulness, make no impression upon him, largely because he sees them only on Sundays and holidays, and at such times the daylight paints everything for him in colors of gold and silver. But the women—they have been driven to despair by the leaky roofs and have felt disgraced by the forbidding exteriors so long that the sightly houses now available with modern conveniences seem like dream homes.

It seems strange that in the past the wives, sisters and mothers in the mining camps should have received so little consideration from the operators. Pinning ourselves down to actual facts, the women don't get any too much consideration at the present time. Many of the improvements that are now so conspicuous have been adopted because the men seemed to demand them—not for their wives, but for themselves.

And getting back to actual facts, it is doubtful if there is a class of women in the world today who have a harder life, and have as few pleasures and more chances to suffer from great disasters than the wives of our coal-mining men.

It is also doubtful if there are many women in the world today, taking them en masse, who raise larger families; for that reason they deserve every possible consideration from the industry that has crying need for their sons.

If you think we exaggerate the indifferent treatment extended to our women, get out all of the articles you have read and recall all of the discussions you have heard and see if the word woman is mentioned frequently.

A New Method of Putting in Survey Stations

By H. C. Austin*

SYNOPSIS—Although sight stations are frequently placed on entry timbers, they are less liable to damage if placed directly in the roof. For drilling holes for the plugs to hold the sight spads, a Yankee drill may be used to advantage.

For some time I have been seeking a convenient, accurate and rapid means of installing survey stations, especially for entry and room sights in coal mines. I recently adopted a method which I believe fills the requirements completely. This method may be in use by others, but as I have never seen any description of it, it occurred to me that it might solve a rather vexing problem for others.

Under ordinary conditions, at least in Iowa, the entry timbering is from 100 to 300 ft. and often farther from the face of the entry. This condition applies especially to entries on which rooms are being turned by others than the entrymen, and the first few shots play havoc with the entry timbers. Furthermore, when the coal is not of sufficient height to permit of the entry being timbered without brushing, it is the custom to keep the timbering back until a sufficient amount of the roof has fallen to secure the necessary height.

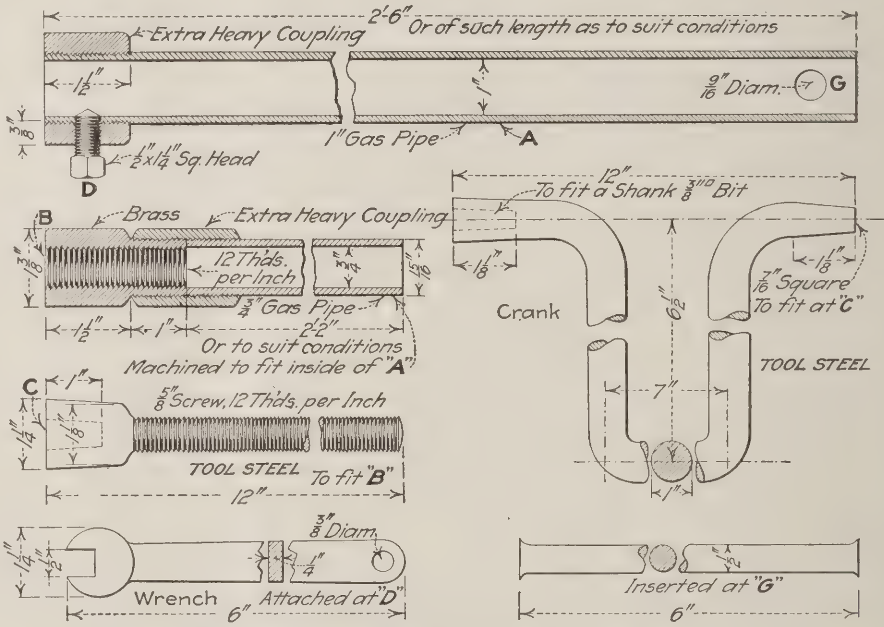
I rather favor survey stations in the roof in preference to placing them on collars or crossbars. However, it is preferable to have them so placed that the station is close to a crossbar for convenience in marking and as a protection against the roof loosening, and thus rendering the station useless.

I use such stations at which sights have been placed for permanent survey stations when they have not been destroyed, before the entries have been timbered. The timbermen are therefore instructed to place the crossbars near but not covering the station. The objection to placing permanent stations on crossbars is because these bars are often slightly moved by wrecks in the entry or from the timbermen happening to drive a piece of lagging after the stations are installed. This condition opens a grave source of error to the surveyor, without a ready means of detecting its existence. A station in the roof, on the other hand, should be free from such sources of error. In case the roof should have loosened any dislocation can be detected by taking the precaution to sound the roof before using the station.

Naturally squeezes or large movements are not taken into account here, for these movements usually make themselves known otherwise. It has been my experience that when entry sights are kept comparatively close to the working face they are used oftener than when farther back. It is easier for a man to take his sights when they are close to the face.

I have also found sight spads dug out of the roof for no other reason than that they were too far from the face, the entryman knowing that when the sights were removed they would be replaced nearer to the face. This condition, coupled with the fact that the roof is usually slabbing off when not timbered, makes a constant repetition of putting up sights, and hence the advantage of finding a ready and rapid means of performing this operation.

One method often used for this work is slow and unsatisfactory. A hole is made in the roof with a miner's pick, a plug driven therein and a spad placed in the plug. This method consumes much time, not only to dig the holes and make the plugs to fit them, but the plugs, which never fit the holes securely, either shrink from drying and fall out or swell and push themselves out, and the work has to be done over again. It takes from 10 to 15 min. to put in a pair of sights in this manner.



MACHINE FOR DRILLING SPAD HOLES

Another method which I have used includes the use of a drilling machine, as illustrated. This method proved satisfactory in every way, except that the drill was somewhat awkward and heavy to carry around in the mine. It is, however, extremely simple, and may be made in any machine shop. The machine will bore a hole in the hardest shale roof quickly and with but little effort. The weight and strength of the drill may be varied to suit local conditions, although the one illustrated was found to be of sufficient strength to drill an exceptionally hard roof.

---

*Consolidated Indiana Coal Co., Melcher, Iowa.

After locating the hole with the transit, the machine is set up and the part *B* drawn out until the bit comes in contact with the roof, when the setscrew *D* is tightened and the hole drilled from 2 to 3 in. deep. After taking the machine down, the plug and spad are driven. The plumb-bob is then inserted in the spad and brought into line by tapping with a hammer, either to the right or left as the case may be. Naturally the more care employed in locating the hole for the drill the less will the spad have to be moved.

At the present time I have abandoned this method for the one hereafter described, which is so simple, handy and satisfactory that it would seem that it should have come into general use long ago. Instead of using the machine illustrated, I now drill the holes for the plugs with a Yankee drill, with which type of boring machine almost everyone is familiar. It is a spring drill in that by pushing on the handle a screw revolves the bit, the return of the handle being accomplished by a concealed coil spring. The drilling may consequently be done with one hand.

Other types or varieties of these or similar drills might, however, be more convenient than the one which I employ. The maximum size of bit ordinarily furnished with these drills is $^{11}/_{64}$ in. However, I have adopted a ¼-in. bit to fit the drill, and while it seems a trifle large for this type of machine, yet it works satisfactorily in the shale roof of the local mines. There was no particular reason for adopting the larger bit except the fact that we ran out of the small size, and it became necessary to use a larger bit until we could be supplied with the regular size.

The fact of the plugs being smaller than those used with the outfit shown in the illustrations limits the lateral movement of the spad, yet I have experienced no trouble in having to redrill holes. The less a spad may be moved after being driven the better, as any movement tends to loosen it in the plug and might be the cause of error later. However, with the small $^{11}/_{64}$-in. drill, a Keuffel & Esser spad will almost fill the hole, and anything but the slightest lateral movement will drive the spad against the side of the hole, bending it before loosening it appreciably.

With an experienced helper, I should judge that at least 75 per cent. of the spads placed need not be moved more than the width of a plumb-bob string to be on line. When the roof can be seen from the last station, a sight may be taken on the drill held to the roof, and when this is in the proper place, drilling can be commenced.

This drill is exceedingly handy when the roof is high, as a hole may be made as far up as one can reach with one hand. It only takes a few seconds to drill a hole, and it is an easy matter to extend a pair of sights between trips of the driver. The drill is small and light and may be easily carried in the pocket. The plugs are also small, and a pocketful will last a day or more. They may also be made with a knife by the helper while the instrument is being set up.

Under ordinary conditions it takes longer to set up the instrument than to drill the two holes and complete the work for the sights. Of course the speed of drilling depends somewhat on the roof, but a hole may be made in a brick with one of these drills, although this is quite hard on the bit. A soft top, which is inclined to stick to the bit, is somewhat bothersome, although it is possible that a special bit with more clearance back of the point would help in this kind of roof.

It is quite possible that roof conditions may be encountered which would make recourse to the heavier machine shown in the drawing necessary. Several of my personal friends have, however, been using a drill of this kind or one similar to it for some time and are quite enthusiastic in its praise. This is my excuse for attempting to enlighten the mine-surveying fraternity on what my friends term "a good thing."

⁂

Unreasonable Increases in the Anthracite Taxes

According to statistics compiled by the Bureau of Railway Economics at Washington, the taxes paid by the railroads of the United States have increased in the ten years between 1905 to 1914 inclusive from $63,474,679 to $150,371,000, or 137 per cent. The taxes paid by the roads classed as anthracite carriers showed an increase from $5,590,214 to $17,226,144, or 208.15 per cent. Thus the anthracite carriers had their rate of taxation increased 50 per cent. more than did the average railroad in the United States. In this connection it is interesting to note to what extent the taxes paid by the anthracite-mining companies have been increased.

The Anthracite Bureau of Information at Wilkes-Barre has been compiling some statistics of this kind, and while the information is not complete, enough has been obtained to show some rather striking comparisons. Companies producing 20 per cent. of the total anthracite output in 1914 paid $403,227 in taxes in 1904 and $1,035,032 in 1910, an increase of more than 150 per cent. in six years. If the 2½-per cent. valuation tax had been upheld by the State Supreme Court, the taxes for the same companies would have amounted in 1914 to $2,616,067, or nearly six and one-half times the amount paid in 1904. Upon the same basis the total taxes payable by all the anthracite companies in 1914 would have amounted to over $13,000,000 or about 7 per cent. of the value of the 81,000,000 tons produced that year.

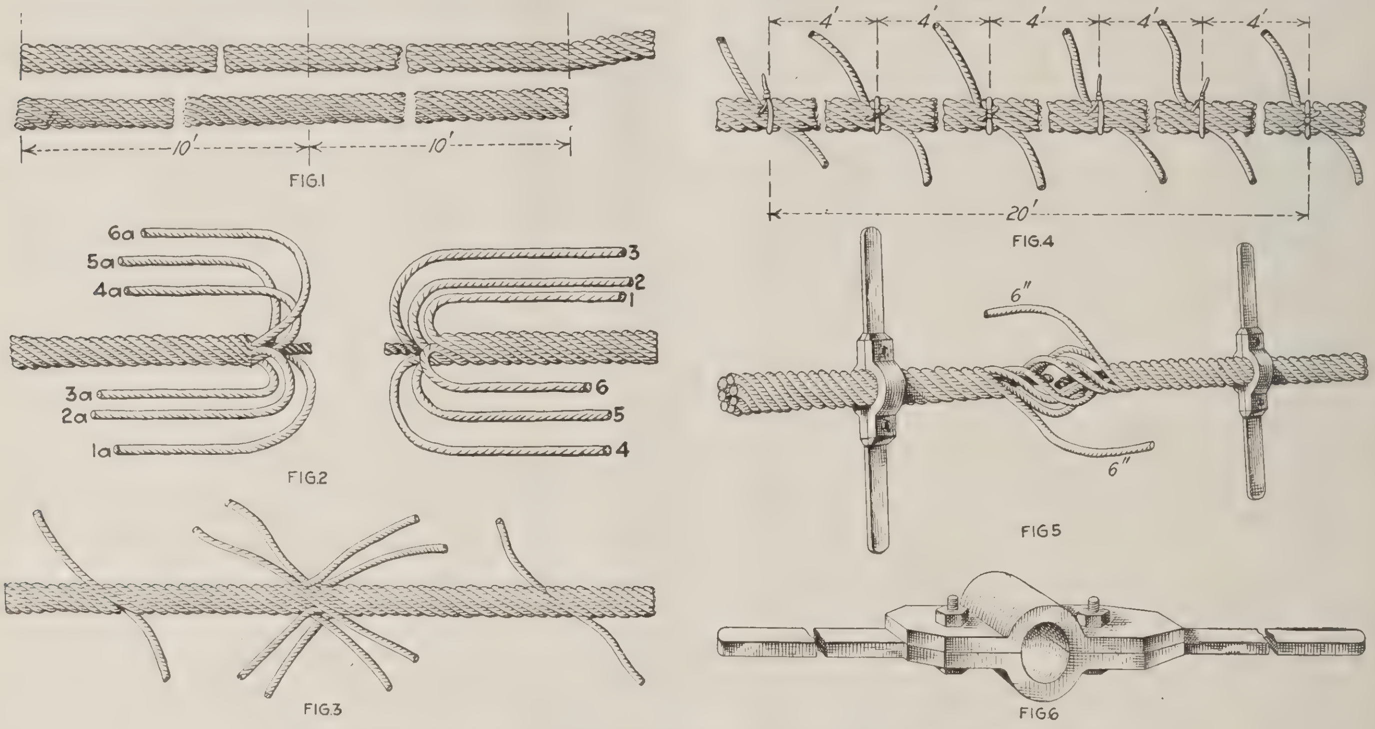
It is to be noted that these taxes for 1914 (if the 2½-per cent. valuation tax had held) would have shown an increase of more than 150 per cent. over 1910. The $13,000,000 of taxes would be at the rate of about 25c. a ton on all of the domestic sizes of anthracite produced in that year.

Another interesting thing to note in connection with the mysteries of taxation in the anthracite region is that, notwithstanding the depletion of the coal beds by the extraction of the coal, the assessment values of the properties are constantly appreciating. From 1907 to and including 1914 over 600,000,000 tons of anthracite have been mined, and yet according to the tax assessors some of the properties have doubled in value. The same companies that reported the increase in taxes show an appreciation of assessed valuation of their properties from $41,200,000 to $92,163,000. In most of the anthracite-producing counties more than 75 per cent. of the taxes are paid by the mining companies, and in one township of Luzerne County 98 per cent. of the total taxes are paid by two companies. There is one small leasehold, also in Luzerne County, from which the owners of the land receive in royalty a return which is barely enough to pay the taxes which are assessed on the property.

How To Splice Wire Rope

By C. J. Fuetter*

It is often the case where wire rope is used that in case of a breakdown no man can be found on the job who can splice the severed ends, and naturally there is much time lost in securing some outside man to do the work. Splicing a rope is generally regarded as a mysterious process whereas almost anyone can learn in a few hours how to do it. The accompanying illustrations show how a substantial wire-rope splice may be effected with ease and rapidity.



THE SUCCESSIVE STEPS IN ROPE SPLICING AND THE CLAMPS EMPLOYED

A hammer and a cold chisel for cutting off ends of strands, a steel fid or marlinspike for separating strands, two clamps for untwisting the rope, a sharp pocket knife for cutting the hemp core and a wooden mallet are all the tools needed. When starting to splice, proceed in this order: First, lay the rope on the ground, with ends overlapping 20 ft., 10 ft. each way from the center, as shown in Fig. 1.

Second, unlay the strands of both ends of the rope for a distance of 10 ft., as shown in Fig. 2. Cut off the hemp cores close up on both sides and bring the strands together so that the opposite strands will interlock regularly with each other.

Third, unlay strand 1^a and follow up with strand 1 of the other end, laying it tightly in the open groove made by unwinding 1^a; make the twist of the strand agree exactly with the twist of the open groove. Proceed with this until all but 6 in. of strand 1 is laid in or until 1^a has become 20 ft. long, then cut off 1^a, leaving an end about 6 in. long.

Fourth, unlay strand 4 of the opposite end and follow with strand 4^a, laying it in the open groove as before, treating this as in the first case (see Fig. 3). Pursue the same course with 2^a and 2, stopping 4 ft. short of the first set. Next do this with 5 and 5^a, stopping as before, then with 3^a and 3, and last with 6 and 6^a. The strands are now all laid in with the ends 4 ft. apart, as shown in Fig. 4.

Fifth and last, the ends must be secured without enlarging the diameter of the rope. Take the two rope clamps, as shown in Fig. 6, and fasten them to the rope, as shown in Fig. 5. Twist them in opposite directions, thus opening the lay of the rope, as in Fig. 5. Next with a knife cut out the hemp core about 6 in. on each side. Straighten the ends and slip them into the place occupied by the core; then twist the clamps back, closing up the rope, and take out the slight inequality with the wooden mallet and a block of wood. Next shift the clamps and repeat the operation at the other five places, and the splice is made.

⁂

Damages for Breach of Coal-Sales Contract

By A. L. H. Street*

Legal phases of the rights of a contract purchaser of coal for resale on the seller's failure to deliver were treated by the Court of Appeals of Kentucky in the late case of Log Mountain Coal Co. vs. White Oak Coal Co., 174 Southwestern Reporter 721.

The plaintiff brought suit to recover the price of installments delivered to the defendant under a contract calling for sale of nut and slack coal deliverable throughout a specified year; and defendant interposed a counterclaim based upon plaintiff's failure to deliver all the fuel called for by the agreement. Judgment having been awarded on the counterclaim, the plaintiff took an appeal to the Court of Appeals, and that tribunal in reversing the judgment decided these points as being applicable to all such contracts:

Damages recoverable for breach of a contract to sell coal intended for resale are measurable by the excess of the market value of the coal, at the time and place fixed in the contract for delivery, above the agreed price. If there is no market for such fuel at the agreed place, the damages are to be assessed with reference to the market value at the nearest available market plus transportation charges.

---

*Logan, W. Va.

*Attorney, St. Paul, Minn.

When the seller knows that the fuel contracted for is intended for resale, his inexcusable failure to make delivery subjects him to liability to the buyer for profits lost on account of being prevented from making the resales. But the Court of Appeals holds that loss of profits cannot be considered as an element of damages recoverable where the buyer makes no effort to obtain fuel elsewhere to take the place of that contracted for, if other coal could reasonably be obtained at a price which would reduce the loss necessarily sustained on account of the breech. But the court holds that the buyer is merely bound to use ordinary diligence to minimize his damages by making purchases elsewhere and is not required to exhaust all *possibility* of buying the desired fuel elsewhere; and that other purchases need not be made when the price of fuel has so advanced that a substitute purchase would enhance the loss.

⁂

Steel Mine Timbering Costs

By R. B. Woodworth*

The cost of timbering per ton of coal produced or per linear foot of heading depends on a number of highly variable factors, regardless of whether the timbering is of wood or steel or any other material whatsoever. Chief among these considerations is the first cost of the material itself delivered at the mine or at the working place.

The economic theory which underlies the introduction of steel in substitution for wood in mine timbering is that whatever might be the relative first cost of the two materials delivered at the mines ready for erection, any advantage in the case of wood should be overcome by the durability of steel.

Conservatively estimated on the basis of its low maintenance cost, it is assumed in ordinary calculations that the mine owner and operator can on the average afford to pay about three times as much for his steel mine timbering delivered at the mine as he does for wood, and in the early stages of the substitution of steel for wood it was assumed that the steel would cost about two and one half times as much as a wood installation.

STEEL MAY BE FITTED EXACTLY TO STRUCTURAL NECESSITIES

Recent practice, however, indicates strongly that in the larger coal mining districts of the United States the difference in cost is not nearly so great, and also that there are other features to be taken into account, such as the small weight of the steel and its greater ease in erection. In some cases it has even been found, where transportation costs are not excessive, that the first cost of the steel timbering erected in place is equal to or but slightly more than the cost of a wooden installation of similar strength. It has also been found that it is possible to fit the steel exactly to the structural necessities, whereas it is impracticable in all cases to do so with wood. This circumstance eliminates an economic waste due to the use, for practical considerations, of larger sized sticks of wood than are really necessary.

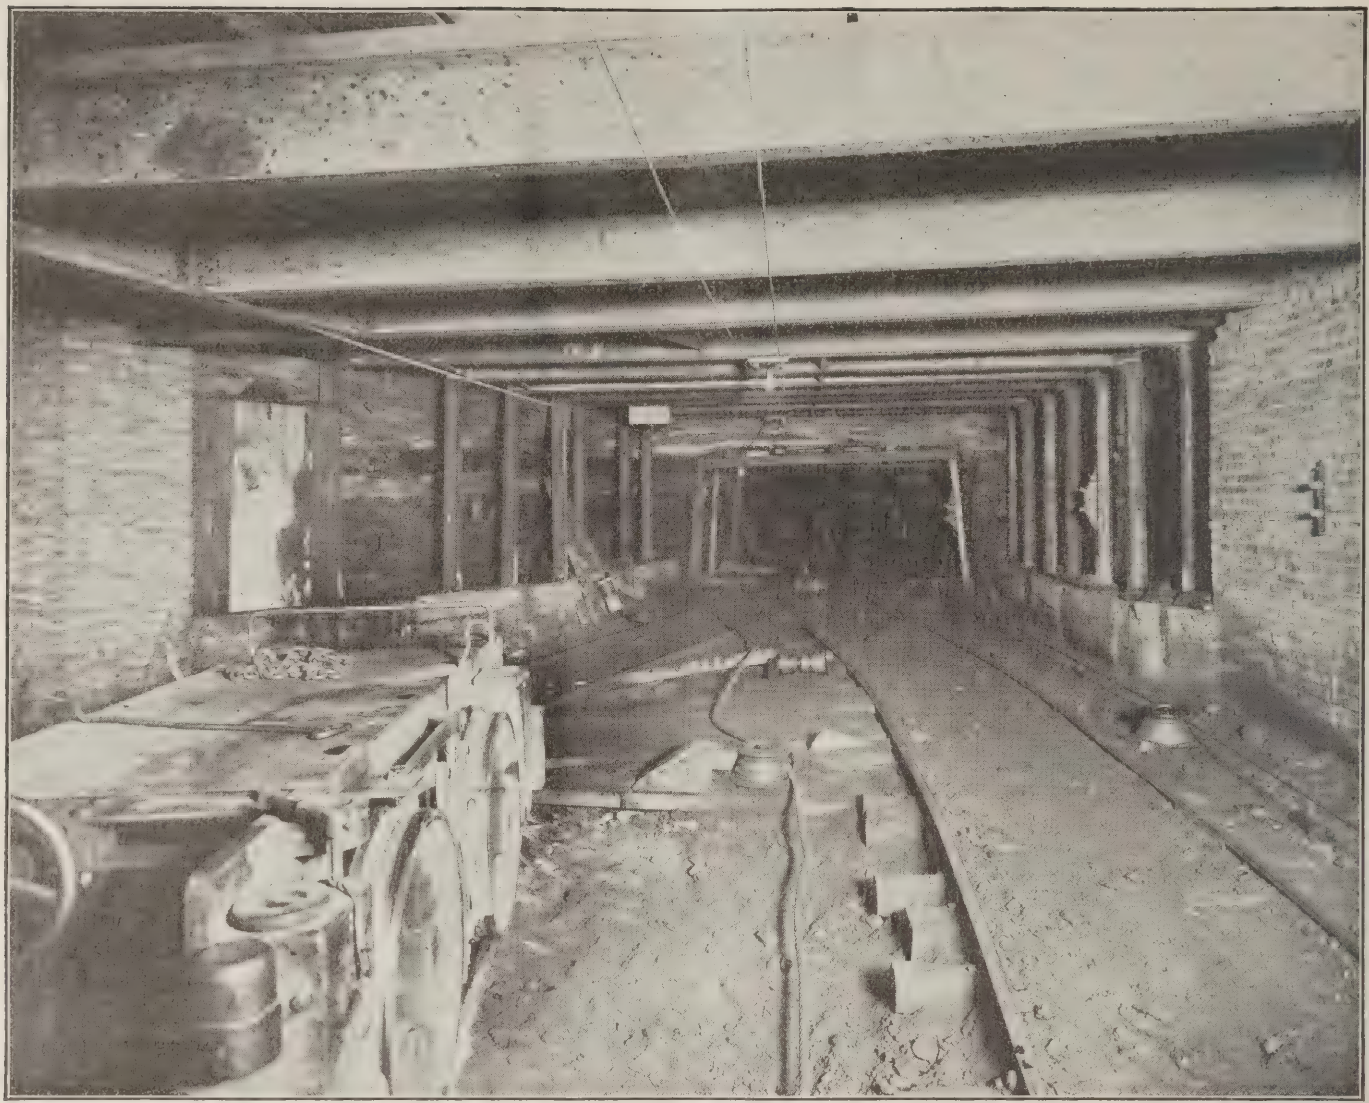
Figures based on bending stresses of 1100 lb. per sq.in. for white oak and 1300 lb. per sq.in. for longleaf yellow pine and 16,000 lb. per sq.in. for steel. Loads to be uniformly distributed over length of span.

---

*Pittsburgh, Penn.



AN ACCEPTABLE AND SATISFACTORY TYPE OF STEEL TIMBERING OVER A SIDETRACK

Table 1 was prepared by a mining company in western Illinois and compares the relative cost of steel beam collars, square-sawed white oak beams and square-sawed yellow-pine beams delivered underground. It also estimates the comparative maintenance costs for a period of 20 years, based on the most favorable and the least favorable probable conditions. The safe working loads are based on the currently accepted values for the materials under bending stress.

TABLE 2. FIRST COST AND COST AT END OF 20 YEARS OF STEEL AND SAWED OAK AND PINE BEAMS

	Steel			White Oak			Longleaf Yellow Pine		
		20-Year Cost			20-Year Cost			20-Year Cost	
Span in Clear, Ft.	First Cost	Favorable Conditions	Unfavorable Conditions	First Cost	Favorable Conditions	Unfavorable Conditions	First Cost	Favorable Conditions	Unfavorable Conditions
16	$9.34	$14.34	$34.34	$9.24	$37.72	$94.68	$7.56	$32.68	$82.92
12	5.31	9.81	28.31	5.04	24.12	62.28	4.68	23.04	59.76
8	2.72	6.72	23.72	2.00	14.00	38.00	2.12	14.36	38.84
14	8.02	12.52	31.02	5.76	26.28	67.32	5.12	24.36	62.84
12	7.07	11.07	28.07	5.04	24.12	62.28	4.48	22.44	58.36
14	4.62	8.87	26.62	3.40	18.20	47.80	2.56	15.68	41.92
12	4.08	7.83	24.08	3.00	17.00	45.00	2.24	14.72	39.68

Table 2 states the first cost of such beams and their cost at the end of the 20-year period under the conditions assumed. It, therefore, represents what might be called a reasonable expectation of relative service in a particular district where the conditions as to transportation, cost of steel and the relative availability of wood are normal.

Examination of Table 2 will indicate that in the case of the 16-ft. spans there is but little difference in the first cost between steel and white oak, and that at the end of 20 years under any circumstance steel is the most economical.

This economical advantage of steel as compared with wood would be somewhat enhanced if consideration were had to the matter of interest on the investment, which, however, the mining company which prepared the table did not consider. It can also be said that repainting of steel once in 4 years is about the limit of probability. The writer knows of installations that have been in place two and three times as long as that without repainting, and it must not be forgotten that, except in special locations, conditions underground as regards paint are much better than they are above ground.

◆

Carbide Lamps Constructed of Copper should never be used, because such lamps are liable to explode. The Bureau of Mines recommends that the spent lime be placed in a dry, metallic can, having a lid with a vent, so that the waste material can be taken out of the mine at the end of the shift.

Calculation of Mine Gangway Timbers

By A. G. Morlock*

SYNOPSIS—Physical conditions affecting the size of timbers required in a mine are variable, and experience must largely govern this determination. There are, however, fixed principles relating to the strength of beams and posts that give valuable assistance in ascertaining what sizes of different kinds of timber or steel are adapted to give the necessary support to the roof in mine workings.

There seem to be no definite rules by which the size of mine-gangway timbers may be calculated. Experience largely governs their use and, as both experience and judgment differ widely, in many cases the timbers are either too small or too large for the work required of them. The compressive stress of timbers—wood or steel—is often neglected, resulting in economic waste.

Owing to the adjustment of stresses underground, it is impossible to calculate the loading of the timbers with mathematical accuracy; however, rules may be formulated that will give approximate results. The experienced miner knows the size of collar best adapted for certain conditions in the gangway, so that by taking an average of the strength of collars used in several different gangways we arrive at a value that may be used in calculating other gangway timbers.

Where the strata are horizontal or the dip is light the loads are applied normal to the collar, and produce therein bending stresses, while compressive stresses result in the legs, each leg taking one-half of the total load on the collar.

Where the dip of the strata is great, however, legs and collars may be subject to both bending and compressive stresses at the same time. The compressive stresses in the collars may safely be ignored, as they are taken care of in the average bending load that a collar will support, but the legs must be calculated for both bending and compression. This bending load per foot of length I will assume as being equal to that applied to the collar.

When the diameter and length of an existing collar are known the safe load per foot of length that it will support may be calculated by the formula

$$w = 0.065\, f \frac{d^3}{l^2} \qquad (1)$$

in which

w = Safe load per foot of length of span (lb.);

d = Least diameter of collar (in.);

l = Length of clear span (ft.);

f = Safe unit fiber stress (1,200 lb. per sq.in. of section, for long-leaf yellow pine and white oak, and 900 lb. per sq.in., for short-leaf yellow pine).

In calculating legs for compressive stresses only, the formula

$$f_c = \frac{L\,(700 + 15\,c + c^2)}{a\,(700 + 15\,c)} \qquad (2)$$

should be used, in which

L = Total load on leg (lb.);

a = Area of cross-section of leg (sq.in.);

c = Length of leg in inches, divided by its least diameter in inches.

The diameter of the leg must be assumed for trial, the most economical section being that in which the safe unit fiber stress is not exceeded.

Practical Examples

The following practical examples will show the correct method of using these formulas.

Example 1—What size legs would be required for a long-leaf yellow-pine timber set in a gangway 12 ft. wide, with clear headroom of 8 ft.; the strata being horizontal? Assume 2,000 lb. per lineal foot for load on collar.

Solution—$2{,}000 \times 12 = 24{,}000$ lb., total load on collar, and $24{,}000 \div 2 = 12{,}000$ lb., total load on each leg.

Assuming the least diameter of the leg to be 4⅜ in., the area of section is $0.7854\,(4\tfrac{3}{8})^2 = 15.03$ sq.in.; and $c = 8 \times 12 \div 4\tfrac{3}{8} = 21.94$, which substituted in Formula 2 gives for the compressive stress in the leg,

$$f_c = \frac{12{,}000\,(700 + 15 \times 21.94 + 21.94^2)}{15.03\,(700 + 15 \times 21.94)} = 1{,}172 \textit{ lb. per sq.in.}$$

Since 1,172 lb. is less than the unit stress for long-leaf yellow pine (1,200 lb.), a 4⅜-in. stick will support the load; however, in this case, it would be advisable to use a larger stick, say 8 in. diameter, to allow for defects in the wood and unforeseen bending stresses.

Example 2—Design a long-leaf yellow-pine timber set for a gangway 12 ft. wide, with a clear headroom of 8 ft., the strata having a dip of 45 deg. The writer has found 2,000 lb. per lineal foot of collar to be the average load in his locality where the dip of the strata is very heavy; so we will assume this value in solving the problem.

Solution—Reversing Formula 1, so as to give the value of d and substituting the values given for the load per lineal foot of collar, unit fiber stress and length of span, we have

$$d = \sqrt[3]{\frac{w l^2}{0.065\, f}} = \sqrt[3]{\frac{2{,}000 \times 12^2}{0.065 \times 1{,}200}} = 15.45, \textit{ say } 15\tfrac{1}{2} \textit{ in.}$$

The load producing compression in each leg is $24{,}000 \div 2 = 12{,}000$ lb. Assuming as before the same bending load for the leg, as for the collar $2{,}000 \times 8 = 16{,}000$ lb. bending load on each leg. Then, assuming 12½ in. as the least diameter of leg and solving for the allowable unit stress due to compression, we have by Formula 2, since $c = 8 \times 12 \div 12\tfrac{1}{2} = 7.68$.

$$\frac{L}{a} = \frac{f\,(700 + 15\,c)}{700 + 15\,c + c^2} = \frac{1{,}200\,(700 + 15 \times 7.68)}{700 + 15 \times 7.68 + 7.68^2} = 1{,}118.4 \textit{ lb. per sq.in.}$$

The unit stress due to bending, for a total load of 16,000 lb., as found above, is calculated by solving Formula 1 for f; thus,

$$f = \frac{w l^2}{0.065\, d^3} = \frac{2{,}000 \times 8^2}{0.065 \times 12.5^3} = 1{,}008.2 \textit{ lb. per sq.in.}$$

---

*Lansford, Penn.

The unit stress due to compression is

$$f_c = \frac{L}{0.7854\,d^2} = \frac{12{,}000}{0.7854 \times 12.5^2} = 97.8 \textit{ lb.}$$

The total stress in the leg due to bending and compression is therefore

$$1{,}008.2 + 97.8 = 1{,}106 \textit{ lb. per sq.in.}$$

As the unit stress produced by the loads is thus shown to be nearly equal to but less than the allowable unit stress, a 12½-in. stick is the most economical section to use.

THE USE OF THE SECTION MODULUS

When calculating beams of special cross-section, as steel I-beams, it is customary to employ an expression called the "section modulus" of the beam. The section modulus (S) of a beam is a value that multiplied by the unit fiber stress (f) of the material gives the bending moment (M) of which such beam is capable of supporting, as expressed by the formula

$$M = fS \qquad (3)$$

But, for a beam uniformly loaded and supported at each end, the bending moment (M), in inch-pounds, is

$$M = \frac{12\,wl^2}{8} = 1.5\,wl^2 \qquad (4)$$

Combining equations 3 and 4 gives for the section modulus

$$S = 1.5\frac{wl^2}{f} \qquad (5)$$

Example 3—Design a steel timber set for a gangway 12 ft. wide, with a clear headroom of 8 ft., the strata having a heavy dip, assuming a fiber stress for steel, f = 16,000 lb. per sq.in.

Solution—The average load per lineal foot on the collar being assumed, as before, w = 2,000 lb. and the span being l = 12 ft., the required section modulus, in this case, is

$$S = 1.5\frac{wl^2}{f} = \frac{1.5 \times 2{,}000 \times 12^2}{16{,}000} = 27$$

Any one of the following sections, taken from steel manufacturers' handbooks, will be satisfactory: 8-in.-32.5-lb. Bethlehem girder beam, section modulus, 28.6; 8-in.-32-lb. Bethlehem H-column, section modulus 26.9; 10-in.-30-lb. standard I-beam, section modulus, 26.8. A 10-in.-30-lb. I-beam is the most economical section, but an H-beam, or girder beam, is to be preferred as it has a broader bearing surface.

Assuming the leg to be a 10-in.-25-lb. I-beam, which has an area a = 7.37 sq.in.; radius of gyration, r = 0.97; and section modulus, S = 24.4; using Gordon's formula for medium steel, fixed-end column and solving for ultimate strength (P), we have

$$P = \frac{50{,}000}{1 + \dfrac{(12\,L)^2}{36{,}000\,r^2}} = \frac{50{,}000}{1 + \dfrac{(12 \times 8)^2}{36{,}000 \times 0.97^2}} = 39{,}308 \textit{ lb.}$$

With a safety factor of 4, the safe unit stress is $\dfrac{39{,}308}{4} = 9{,}827$ lb.

Again, assuming the same unit bending load for the leg as for the collar, w = 2,000 lb. per lineal foot, and the length of the leg being l = 8 ft. the bending moment, applying Formula 4, is

$$M = 1.5\,wl^2 = 1.5 \times 2{,}000 \times 8^2 = 192{,}000 \textit{ in.-lb.}$$

This makes the unit fiber stress due to bending

$$f = \frac{M}{S} = \frac{192{,}000}{24.4} = 7{,}869 \textit{ lb. per sq.in.}$$

The unit stress due to compression, for a 12-ft. span, the sectional area of the leg being a = 7.37 sq.in. is

$$f_c = \frac{L}{a} = \frac{2{,}000 \times 12}{2 \times 7.37} = 1{,}628 \textit{ lb. per sq.in.},$$

which makes the total unit stress due to bending and compression

$$7{,}869 + 1{,}628 = 9{,}497 \textit{ lb. per sq.in.}$$

This actual stress in the leg is less than the safe stress, therefore a 10-in.-25-lb. I-beam will satisfy the conditions assumed in this case.

◆

German Post-Pulling Device

A German device which may be termed a post puller, although it differs from what is commonly understood in the United States by that name, is shown in the accompanying illustration. It is described in *Glückauf* by "Mining Assessor" Doctor Beissel, of Aachen.

The device constitutes essentially a joint or hinge in the post which may be released by pulling a rope, thus allowing the post to be buckled and brought down. The post is cut obliquely into two segments, so that it tends to slide apart under the rock pressure. The sliding action is resisted by friction and also by the mechanical joint. When the latter is loosened, the pulling apart of the post is an easy matter.

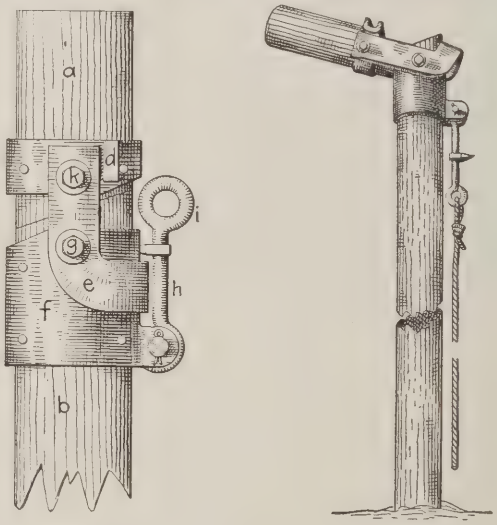


Fig. 1 Fig. 2

DETAILS AND OPERATION OF POST PULLER

In Fig. 1, *a* and *b* are the segments of the sawed post. The piece *a* carries a collar with lugs *d*. Against these rests a bell-crank lever *e*, which is pivoted at *g* to the collar *f* around the lower segment of the post. The hook or latch *h* with the rope eyelet *i* is pivoted at the bottom of the ring and carries a point which is driven into the post through a hole in the ring above the lower part of the lever *e*, thus holding this lever in position.

Thus when the latch *h* is pulled outward by the rope, the lever *e* is released. The lever *e* is loosely pivoted to the upper collar by the pin *k* to keep the upper and lower portions of the device from dropping apart when relaxed.

The post is pulled by a rope in the eyelet *i*. This releases the lever *e*, which turns on its pivot, relieves the pressure against the lugs *d* and permits the upper part of the post to slide off the lower.

These pullers have been given a long trial in seams about 7 ft. thick pitching 45 deg. They are put on the posts aboveground so that setting the timber in the mine takes only the usual time. In order to allow the proper amount of friction at the joint, a post of 4-in. diameter should be sawed at 30 deg. and one of 7¼-in. at 38 deg. For various practical reasons it is better to make the joint near the top of the post.

Numerous advantages are claimed for this device. It is patented and its manufacture is in the hands of the Eschweiler Bergwerks-Verein, Eschweileraue, Germany.

⁂

Extracts from a Superintendent's Diary

After being driven almost to desperation by repeated failure to devise a satisfactory dockage system, I believe I have hit upon a scheme at last that will fill the bill.

Reviewing the various dockage schemes that we have tried at different times, I became impressed with the fact that in none of them had we made an attempt to reward miners who were doing satisfactory work or even to show them that we appreciated their efforts. I recalled that in all lines of industry prizes and bonuses have become recognized as valuable aids, and I could think of no good reason why miner folk should not be susceptible to the same influences as other laboring men.

With that thought as a starting point, I worked up the plan which I have just put into effect.

I had in mind two things—first, recognition of good work, and then a suitable reward.

We have several foremen whose duty it is to wander about in the mines, keeping tab on the loaders to see that they load clean coal. These men are to be replaced with honor men chosen from the ranks of the miners. At the close of each two weeks' period we will select men who have made the best records for clean coal as shown by our slate reports during that period, and they will act as loading inspectors, showing the others just how the loading should be done; because of their record they can speak with authority. For this work we will pay them a rate twice as large as they earned as miners during the previous two weeks. They are thus granted recognition and suitable reward.

But we will not let the reward rest with that. We wanted to arrange the reward so that all of the men could profit by the improvement, and to accomplish this end we will divide with the men any increase in the value of our coal because of its better quality. In our case this is very easily determined. All of our small sizes have to be handled through a washer, and the washer loss is dependent entirely upon the amount of slate that the miner loads with his coal. If the records show that we have reduced the washer loss 200 tons during a two weeks' period, we will credit the men with one-half, or 100 tons, as a bonus, valuing it as washed coal.

Taking the average for the last 12 months, we found that the washer loss was 10 per cent. of the total tonnage handled by the washer, and we are to use that as the basis for determining how much improvement has been made.

I had a hard time getting our general manager to consent to a trial of the plan, as he was afraid of the precedent that might be established. Our local union committee finally agreed, however, that we might adopt the plan and let it remain in force during the unexpired term of our present contract, and then withdraw it entirely if we desired. They were largely governed by the fact that we were really not making a change in the contract price. This made it easier for our manager to give his consent.

According to my prediction, the quality of our coal will improve to a noticeable extent during the first few months and then reach a standard that will be hard to improve upon. The men will have learned by that time to live up to their increased income, and we will be able to supply the increased income by increasing the digging price in return for more liberal dockage rules; this will automatically rid us of all undesirables.

⁂

Rapid Increase in Automobile Coal Trucks

As indicating the rapid change being made in the type of delivery equipment in use by the retail dealers, the credit departments of the various shippers report numerous inquiries from automobile concerns as to the standing of some of their customers. It is really remarkable in some of the larger cities to note the rapid increase in the use of automobiles for coal delivery. New trucks are seen on the streets almost hourly. Practically all of the wholesale houses, too, have outfitted their salesmen with runabouts.

⁂

An Injunction Is Dissolved

By a decree of Judge Moser, of Sunbury, the preliminary injunction secured by the Kingston Coal Co. to restrain the Plymouth Coal Co. from stopping its fans and pumps at the abandoned Dodson colliery at Plymouth has been dissolved at the cost of the plaintiff. An opinion in the case is soon to follow.

Several months ago, after injunctions were secured by Plymouth Borough to restrain the Plymouth Coal Co. from further mining in order to safeguard the borough against a serious subsidence of the surface, the Plymouth Coal Co. abandoned its Dodson colliery. The Kingston Coal Co., which operates the Gaylord colliery adjoining, then secured a preliminary injunction to restrain the Plymouth Coal Co. from removing its pumps and stopping its fans, on the ground that water and gas would enter the Gaylord colliery through openings in a barrier pillar.

The Plymouth Coal Co. denied liability and responsibility for keeping its fans and pumps in operation after being compelled to abandon its colliery. The cost of running fans and pumps and the responsibility for cutting through the barrier pillar also entered into the case. The injunction was heard before Judge Moser, and after final hearing and arguments, the court directs that the preliminary injunction awarded Mar. 29, 1915, be dissolved.

⁂

Railway Coal-Storage Plants

In our issue of Oct. 16, 1915, we republished an article entitled "Railway Coal-Storage Plants" from the pages of a contemporary. Roberts & Schaefer Co., of Chicago, write us saying that the coal-station machinery referred to on page 626 was not furnished by the Ogle Construction Co. as stated, but by the Roberts & Schaefer Co. The cranes were built as stated by the Link-Belt Co.

A Few "Dont's" for Motormen

By James Thomas Reynolds*

The unusual possibilities of danger to the life and limb of not only the young men who generally operate the motors underground, but through any careless act of theirs to every employee in the mine at times, are only too obvious to anyone whose work takes him into one mine, let alone many. These pernicious opportunities for man-injury and equipment-destruction are glaringly plentiful to those who have reason to look over many different mines in many different states.

A man whose work lies in one mine may see much he would have otherwise—motors run deliberately without regard to safety of costly material or even the lives of the motormen and snappers themselves. In traveling from one mine to another one sees so much done that should not be done, so much omitted that ought not to be omitted and so much faulty operation through bad mining conditions as well as bad practices on the part of the operatives that the wonder is, not that so many lives are lost through this cause or causes and so many men are injured, but that the result is not worse.

The intent of the following suggestions, however, is not to fully cover this entire subject, which of course takes in not only the carelessness incidental to the men themselves whose duty is to run the underground motors, but the conditions of the roadways, tracks, etc., over which they are compelled to operate. These conditions vary as the mines themselves vary—more's the pity! Uniformity of action and care is fortunately possible to the personnel, and it is directly to the latter that I address a few "dont's" which may easily be memorized by the motorman and helper who have a tendency to thoughtlessness while working.

Trusting these may be the indirect means somewhere of saving a life or saving someone from injury, I append them as jotted down in my notebook, without effort at logical sequence:

Don't forget that safety is your first consideration.

Don't allow anyone except those authorized by the mine foreman to ride on your trip or motor. Injury or death may result therefrom, in which case remember that YOU would be held responsible.

Don't leave your trip where it will obstruct the passage of air if this can possibly be avoided (and it generally can by a little more care and effort), and don't open a door to pass your trip through without closing it; for, failing in either of these precautions, you may, particularly if the mine is gassy, cause by such apparently trivial action your own death as well as that of all in the mine.

Don't hurry to gain five minutes and by so doing lose an hour; it's a poor "gain" on the cost sheet.

Don't use abusive language to the foreign miners who at first fail to understand you. Without the miner there is neither work nor pay for the motorman. Remember that if they can't speak your language you have nothing on them in that; it is 10 to 1 that you cannot speak theirs.

Don't allow your trip to get beyond control, but if this contingency arises, keep a cool head. This sometimes plays a great part in getting out of a bad mess with a whole hide.

Don't allow any unauthorized person to handle the controlling parts of your motor; accidents and loss of life have sometimes resulted from the motorman's indifference to this precaution.

Don't fail to report any bad track immediately to the proper roadman, and if this fails of result, to the foreman. Remember, a penny spike in time may save the company a costly motor and you your health or life itself.

Don't get reckless and "pull her wide open" when matters don't seem to be going smoothly. The greatest day's run isn't always to the daredevil motorman's credit; he's too apt to get into a smashup just when he thinks he has the record clinched. Moreover, it is better for the company and you to go steady and be safe a thousand times than fast and injured once.

Don't forget to oil your motor when required.

Don't pull cars back over frogs and through switches to replace them on the track. You are not putting yourself in good standing with the company or the foreman by saving ten minutes' time and destroying $10 worth of cars, motor and roadway. The firm has supplied you with climbers with which to replace cars.

Don't forget that the motor boss is paid by the company to give you orders. These may not always be to your liking, but remember he's paid to command and you to obey, and it's useless to take your "revenge" by leaving the trip standing and quitting without notice, thinking the plant will have to shut down. It won't. I know, because I've tried it.

And when you think you must take an unnecessary chance with your life, even if you forget yourself, don't fail to remember those at home.

---

*Mine-safety inspector, Aetna Life Insurance Co., Houston, Penn.

Cause Unknown

By R. T. Strohm

The miner, as he left his job,
Cleaned out his soothing brier;
The ashes fell among the gob
And set the stuff afire.
The owners wagged their heads—and jaws;
They spouted threat and fustian;
And then announced that ancient cause,
"Spontaneous combustion."

He left some carbide when he quit,
The rules of safety spurning;
The moisture soon got into it
And started things to burning.
They sought the cause with might and main,
By quizzing and inspection,
But all their striving was in vain;
It still escaped detection.

A timber for his mine lamp made
A rather handy holder,
Until the flame, by currents swayed,
Had set the wood a-smolder;
And though the inquiry brought out
A world of elocution,
The problem still was left in doubt;
It quite defied solution.

He threw a wornout wick aside,
All thought of risk disclaiming;
It fell on timber old and dried,
And later set it flaming.
From lip to ear wild guesses sped,
And theories flew faster,
But this is what the verdict read:
"*Mysterious disaster.*"

Barometric Condenser Drain

By H. R. Bissell*

SYNOPSIS—A practical method of draining a water pocket in piping carrying steam under 28 in. of vacuum is here described.

Fig. 1 shows the 24-in. exhaust piping from a 500-kw. turbine to the surface condenser installed at the central power station of the Century Coal Co., at Century, W. Va. This condenser operates under 28-in. vacuum referred to a 30-in. barometer, or practically 1 lb. absolute pressure.

The turbine exhausts downward, and the steam, after passing through the gate valve, must rise about 10 ft. to the inlet of the condenser. Water collects in the lower part of this 24-in. line owing to two causes—first, there is a partial condensation of the exhaust steam before reaching the condenser, and second, at this plant the steam is at times very wet and occasionally even slugs of water come over from the boilers. These of course collect in the 24-in. line after passing through the turbine.

While without question some of this water is carried up into the condenser by the high velocity of the exhaust steam, still a safe and satisfactory operation of the turbine required some method of removing this water promptly and automatically. As originally installed there was a 2-in. drip line from the lowest part of the 24-in. pipe to a small pump and hotwell, a float in the latter actuating the steam-inlet valve to the pump.

This arrangement was not satisfactory because of the fact that local conditions prevented the pump being placed at such a depth as would give the inlet water to the pump sufficient head for the automatic controlling of the pump at variable speeds by the float in the hotwell. This was an important point in order to take care of slugs of water coming over from the boilers.

To make this point clearer, the float would control the pump when the condensate was collecting in small quantities; but with a sudden increase in the condensate, the float would open wide the steam-inlet valve, and with the low head of water there would not be sufficient pressure to force the water into the pump at its increased speed, causing it to race. It was therefore necessary to throttle down the pump to make it operate, and under such condition it would not automatically remove sudden increases in the condensate.

It should be borne in mind that the problem was to remove water from the 24-in. line which was under 28-in. vacuum and that, instead of 14.7 lb. atmospheric pressure to force water into the pump, there was a maximum of 1-lb. pressure, depending of course upon the condition of the pump.

The Original Plan Included Three Valves

The original theoretical plan for removing the water by a barometric drain is shown in Fig. 2. A 2-in. pipe line with three valves was run from the 24-in. exhaust to the hoisting shaft of the mine, a distance of 130 ft., with a minimum downgrade of 1¼ per cent., then down the shaft 34 ft. and turned upward. For convenience the barometer can be considered as being 30 in. and the vacuum in the condenser as 28 in., inasmuch as any change in the barometer is accompanied by a corresponding change in the absolute pressure of the condenser.

The proposed operation was as follows: Suppose valves *A, B* and *C* to be closed and the line included between them to be full of water. Upon opening valve *C,* the water would run down and out until it left a column 34 ft. high, balanced by atmospheric pressure. Above the water there would be a practical vacuum. Next suppose the condenser to be brought up to 28-in. vacuum, or 1-lb. absolute pressure. Should valve *A* now be opened, there would be 1-lb. pressure, forcing the water toward the shaft; and this pressure being sufficient to lift water 2 ft., the proposition would work theoretically if the 2-in. line rose 2 ft. instead of slanting downward this amount. However, the line being entirely downgrade, the 1-lb. pressure would lower the barometric column to 32 ft., and as water entered above, a corresponding amount would overflow at the bottom to maintain that height of column.

FIG. 1

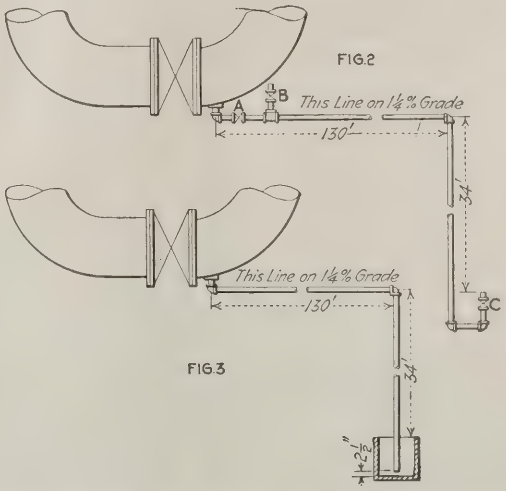

FIG. 2

FIG. 3

ARRANGEMENT OF DRAIN ON TURBINE EXHAUST PIPING

When ready to shut down, valve *A* should be closed, after which the condenser could be stopped and the column of water would be left suspended in the mine shaft overnight. The purpose of the valve *B* was to prime the line after closing the valve *C,* in the event of the water column being lost while the turbine was idle, by air leaking through the valve *A.*

---

*Mining engineer, Century, W. Va.

This proposition depended upon air-tight valves, and there is no question but that the more practical plan is as shown in Fig. 3. This has been successfully installed and is far more efficient, and in addition is entirely automatic.

As noted in Fig. 3 a line similar to that shown in Fig. 2 was laid, except that there are no valves and the lower end of the 2-in. line extends down into a wooden tank, 15x15 in. and 16½ in. deep, affording ample capacity for water to seal the end of the drip line at all times.

Absolutely no attention to this line is required. When the condenser is started, atmospheric pressure forces water up the column a distance of 13.6 times the inches of vacuum in the condenser (for 28 in., 31.7 ft.), and an interesting test can be made by checking the amount of water displaced in the tank with the volume of water figured to be in the column. Since the absolute pressure in the 2-in. line above the water column is the same as in the condenser and since water will seek its level, whether under 100-lb. pressure, atmospheric pressure or under vacuum, as condensation collects in the 24-in. turbine exhaust it runs down the 2-in. line to the water column in the shaft, and a corresponding amount overflows the tank, so that the barometric column maintains the same height, according to the barometer and the degree of vacuum maintained in the condenser.

It will be noted in Fig. 3 that the 2-in. drip line extends within 2½ in. of the bottom of the wooden tank. What would be the result should the level of the water in the tank for any reason recede below the bottom of the 2-in. drip line while the condenser is in operation? While it is well known that atmospheric pressure will not lift water higher than as already explained, still the column of water in such a case will be carried up into the 24-in. line by the velocity of the air going up through the 2-in. pipe. As the top of the water column is approached, the pressure existing therein decreases and the speed at which this column is carried upward by the air gradually rises, as the air after entering at the lower end reaches points of lower pressure and expands, until all the water in the column has been discharged into the 24-in. pipe.

An additional point which I wish to bring out is that by a "whirlpool" effect the entire 2½ in. of water in the tank below the column has been swept up the 2-in. line by the velocity of the air being forced up this pipe. The vacuum in the condenser was of course destroyed.

Canary Is Not a Safe Test of Deoxygenated Air

The resistiveness of a canary bird to oxygen deficiency has been demonstrated during two explorations of a mine-fire area by the apparatus crew of the Bureau of Mines from the Pittsburgh station. Duplicate air samples that were collected during the first exploration at a point 1,000 ft. from the fresh-air base showed on analysis only 6 and 7 per cent. oxygen respectively, yet the canary bird was apparently not affected. The safety lamps were extinguished, however, before the apparatus crew advanced to the point where these samples were collected.

On the second exploration, to a point 2,000 ft. from the fresh-air base, one air sample showed only 2 per cent. oxygen, and the canary was of course overcome long before this point was reached. However, the bird was carried back at once to the point where the analysis had shown 7 per cent. oxygen, and when the apparatus party returned in 20 min. they were surprised to find that the canary had revived in that atmosphere. All the analyses were made with an Orsat apparatus at the fresh-air

SCOTT COLLIERY OF THE SUSQUEHANNA COAL CO. AT SHAMOKIN, PENN. THE BOILER HOUSE IS EQUIPPED base inside the mine. The atmosphere contained practically no carbon monoxide, as the analyses show:

	Sample No. 1	Sample No. 2
Carbon dioxide, CO_2	2.6%	2.5%
Oxygen, O_2	7.4%	6.0%
Carbon monoxide, CO	trace	trace
Methane, CH_4	14.6%	16.8%

This fire area had been sealed off for 11 months. The apparatus explorations showed that no fire existed, and the mine was successfully reopened. This demonstration of the ability of the canary bird to live in an atmosphere so low in oxygen as to be fatal to human life is most important. It demonstrates that it is absolutely needful to *carry a safety lamp to test for oxygen deficiency.* The canary may be used to indicate the presence of carbon monoxide, but that is all. Every rescueman must keep this in mind and not say that "I am willing to go anywhere where the canary survives."

Use of Liquid Air for Blasting by a New Process*

The first experiment with liquid air as an explosive dates back nearly to the beginning of its industrial production. Professor von Linde made an explosive called "Oxyliquit" by mixing liquid air with charcoal. This explosive broth, or paste, was put directly into the drill hole and fired by means of cartridges and fuses.

Since this primitive method gave unsatisfactory results, it was modified by filling a suitably prepared cardboard cylinder with an explosive substance, preferably by dipping the whole in liquid air. This method gave results, but was lacking in safety and depended on the skill of the workmen and quickness of manipulation. The trouble was due largely to the enormous difference in temperature between the liquid air and the surrounding rock, so that the air rapidly evaporated in the hole. The maximum theoretical life of a blasting cartridge was thus only 10 min., while in practice it was still shorter.

Interesting experiments have been made in France by Georges Claude, and other experiments which improve upon the von Linde method have been conducted in Charlottenburg, Germany, by Kowatsch, with the coöperation of von Baldus.

In order to prevent a rapid evaporation of the liquid air, Kowatsch puts the cartridge with the dry carbon container in the drill hole before introducing the liquid air and avoids the dangerous loss of time by necessary preparations, such as tamping the hole after the mixture has been made. The liquid air is not introduced until time for shotfiring. This reduces the evaporation period to a minimum.

The cardboard cylinder contains a perforated partition tube in which is placed a perfectly innocuous mixture of infusorial earth and oil or asphalt, or of soot and paraffin. The central partition tube incloses a cardboard tube, over which is thrust another cardboard tube to serve for carrying off the evaporation product of the liquid air. If several holes are to be fired at once, the electric wires are connected.

The liquid air intended for each hole is provided in a suitable quantity in a small flask to the opening of which is attached a metal tube with a conical point, into which tube is introduced the central tube of the cartridge. To charge the cartridge, it suffices to raise the back end of the flask. The liquid air is then lifted by pressure of its evaporation products (just as water containing gas is lifted by pressure of carbonic acid) in the metal tube and is forced into the cartridge. At the moment when the shot is fired by an electric fuse, the liquid air combines with the components of the charge and causes an explosion of extraordinary energy.

WITH 12 WATER-TUBE BOILERS AGGREGATING 1,500 HP. ALTERNATING CURRENT AT 2,300 VOLTS IS USED

Avoidable Engine Accidents

By C. W. Crawford*

SYNOPSIS—When a steam engine is wrecked, faulty design is often considered the cause. As a matter of fact, however, the machine may be the only properly designed piece of apparatus about the plant. Efficient separation of entrained water from the steam is good insurance against engine accidents.

In spite of all caution and remonstrance mishaps occur to the hoisting machinery of coal mines. These are called accidents. Sometimes such mishaps are disastrous, totally or partially disabling the engines. Breaking bed plates, smashing pistons by forcing them over or pulling them off the rods; straining keys and loosening winding drums, cranks or crankpins; breaking crossheads and shearing connecting rod bolts; breaking pillow-block caps, etc., are a few of the accidents which render an otherwise good engine a veritable scrap heap. The cause of these disabilities is generally disputed, and denied even if known, but it is to be hoped the truth will prevail sooner or later.

The odium of a smashup is usually put on the builder of the engine, whereas he is generally the only innocent party in the transaction.

The True Cause Is Obvious

On actual investigation the true cause is not hard to find. Water is carried from the boilers in spray, or sometimes in solid slugs of greater volume than the clearance space in the cylinders; and water being incompressible, the law of impenetrability provides no space for it, and the piston having the right of way, the water must get out or any one of the foregoing contingencies will happen. Of course some water does get away—sometimes—into the steam chest; but the engine being in rapid motion, all the water has not the time to escape. The piston stops dead on striking the water; but since the contact with it is made at the toggling point of the crank, the momentum of the heavy drum carries the piston forward. The pressure against it is practically incalculable—the strongest mechanical force in nature—and it is inevitable that something must break.

It is a distressful calamity to the mine owner when such an accident occurs in the midst of a cold snap and an extraordinary demand for coal, laying the mine out for a week or a month.

If such accidents were inevitable or due to some occult reason it would indeed be a calamity to all concerned; but since the cause is so transparently apparent and so clear to every one who thinks, it would appear a slur on the engineering profession.

This is no new calamity. Such accidents used to occur away back in steamboat times before the war; but the cure was found in using large steam drums.

The steam drum is now barred and debarred, ostracized, slandered and misrepresented until no one dares to recommend it. The boilermaker is the guilty party. He not only condemns the steam drum but has reduced the steam outlet from the boiler to a size inadequate to supply an engine of equivalent horsepower—and this appears to be a standard among boilermakers.

This is the first, prime, efficient cause of practically all the ills that hoisting engines are heir to. The violent ebullition in the boiler raises a spray which is caught up, together with some steam, by the pipe through which the latter passes at the rate of a mile a minute or more. This powerful draft necessarily draws the water in swells toward the outlet and obviously must catch more or less solid chunks of water at times when, as is often the case, the water gets pumped up too high while the fireman forgets. Anyway, it is certain the water is carried into the cylinders in solid slugs, because no other medium accessible to the engine could produce such unlimited resistance.

For comparison, consider the piston which is forced on the rod at a pressure of at least 60 tons, equal to 120,000 lb. The area of the piston (24 in. diameter) is 452 sq.in. With steam at 100 lb. per square inch this is equal to a total pressure of 45,200 lb. This gives a remainder of about 75,000 lb. in favor of the piston—and this without reference to the collar at the back and the riveting at the front. Whence comes this extraneous force that wrecks engines? Steam cannot do it, and nothing else except water ever enters the cylinder.

There is still another mischief which water does in the cylinder. Mud in considerable quantity is brought over from the boilers with the water, to the detriment of valves and rings. The balanced piston rings are gummed fast with mud and the balance is thus lost, making a load of several thousand pounds to be carried by the valve. Plain water is a poor lubricant and when mixed with mud it is not improved, while the oil lubrication is vitiated.

Entrained water is heated practically, if not quite, to the point of evaporation and exhausted in spray to humidify the atmosphere. It is not unusual in dry seasons to haul water by rail 15 mi. and disseminate it in light showers after heating it several hundred degrees. But coal is cheap at the mines.

A Separator Provides the Remedy

Only one thing is needed to obviate this waste and avoid the smashups—since the boilermaker cannot be diverted—and that is a separator, one that actually separates the water from the steam and that the engineer can make for himself out of pipe fittings, or (if such can be found) buy for $50 or less. Separators are numerous enough in the market—such as they are—but their principal function seems to be to separate $150 from the operator.

The separator I refer to is not new but is known to all mechanical engineers everywhere, and consists (when made of pipe fittings) of a tee about two sizes larger than the steam pipe, which must be vertical. The tee is placed so that the side opening leads horizontally to the throttle valve. The top end of the tee is reduced by a bushing so as to fit the vertical steam pipe, the end

---

*Crawford & McCrimmon Co., Brazil, Ind.

of which is to have a thread sufficiently long to reach the center of the side outlet. The lower end of the tee has a short pipe attached, for a reservoir with a cap on the bottom and a trap connected to remove the condensed water. The reservoir must be large enough to accommodate any slug of water that may come over.

Such a separator will remove absolutely all the water and most of the spray that might otherwise do damage by passing through the cylinder. Its action depends on the velocity and specific gravity of the entrained water, its momentum carrying it past the side outlet into the reservoir, where it remains. The steam rises and enters the engine through the side outlet.

It is not expected that this device will give perfectly dry steam, but it at least guards against wrecking the engine. To get the best result, a dry pipe with a steam outlet at least twice the area of the boilermakers' standard should be installed in the boiler, as well as a large header line with drip pipes leading back into the boiler below the water line.

Probably not more than one engine in ten runs on really dry steam. Ordinary superheating (not extreme) renders steam dry enough, and by the time it reaches the cylinder it is toned down to about the proper saturated dryness for good lubrication and economy.

⁂

Metropolitan Editors Visit the Anthracite Field

The operators and owners of anthracite mines acted as hosts to representatives of the metropolitan press on a trip of inspection throughout the anthracite field last week. The newspaper men and journalists were taken on a special train first to Scranton, where they arrived Thursday morning, Nov. 11. Practically all of Thursday, Friday and Saturday was spent in a hurried but detailed tour, from the most northern of the hard-coal mines to the southern collieries in and about Pottsville.

It is likely that never before were mine operators subjected to such a crossfire of questions, and it is certain that never in the history of anthracite mining have the big bosses been so frank in their responses. A real effort was made to show coal mining as it actually is, and although the operators endeavored to exhibit some of their most modern operations, there was not the slightest attempt to cover the uglier sides of the business or hide the older plants.

The newspaper men were taken through breakers, power houses and all other surface buildings, while two trips were made through underground workings. In a number of places the homes of the miners were visited. Old-time conditions were compared with the more modern developments, showing at least the desire on the part of the owners to improve the surroundings of their employees. The difficulties and dangers of mining were represented in their true light, while first-aid provisions were shown and described.

The editors supplemented their visual observations with numerous notes covering such matters as wages, costs of mining, prices of coal lands and initial outlay for plants. They seemed to be more interested in what was being done to educate the miners than in the methods of getting out coal. Day and night schools came in for much comment, and it is probable that mine owners received some impressions themselves as to what the outside public expect of those who control the destinies of thousands of workingmen. The operators and their guests included the following persons:

COAL MEN

S. D. Warriner, president, Lehigh Coal and Navigation Co.
E. E. Loomis, vice-president, Delaware, Lackawanna & Western R.R.
W. J. Richards, president, Philadelphia & Reading Coal and Iron Co.
F. M. Chase, vice-president and general manager, Lehigh Valley Coal Co.
A. C. Dodson, vice-president, Dodson Coal Co.
T. M. Dodson, vice-president, Charles M. Dodson & Co.
W. L. Connell, president, Green Ridge Coal Co.
C. F. Huber, president, Lehigh & Wilkes-Barre Coal Co.
S. B. Thorne, president, Temple Coal Co.
F. H. Hemelright, vice-president, Thorne, Neal & Co.
J. B. Neale, president, Duck Run Coal Co.
F. E. Zerbey, general manager, Kingston Coal Co.
W. A. May, president, Pennsylvania Coal Co.
W. W. Ingliss, general manager, Hillside Coal and Iron Co.
Edwin Ludlow, vice-president, L. C. & N. Co.
Eli T. Conner, Hudson Coal Co.

⁂

Delay of Coal Shipments—In a suit against a railway company for delay in delivering a shipment of coal, the burden is on it to show that the delay was caused by a connecting line from which it received the shipment. If the delay entails loss to the owner substantially equaling the value of the shipment, he may refuse to receive the coal when tendered to him. (Alabama Court of Appeals, Goodwater Manufacturing Co. vs. Central of Georgia Ry. Co., 69 Southern Reporter, 343.)

Rocky Mountain Coal Mining Institute to Meet

The next regular meeting of the Rocky Mountain Coal Mining Institute will take place in the convention room of the Albany Hotel at Denver, Colo., commencing at 10 a.m., Nov. 29, and continuing two days.

The regular business, including the reports of committees and the election of officers for the ensuing year, will receive the attention of the institute, after which some very interesting papers will be presented and discussed.

The Albany Hotel has been selected as the official headquarters, and the management has offered the visiting members special rates in addition to the free use of the convention hall and committee rooms.

The following committees have been appointed: Arrangements—W. C. Ferguson, Equitable Building, Denver; H. C. Glaze, First National Bank Building, Denver; Samuel Tescher, Colorado Building, Denver. Entertainment—Benedict Shubart, Boston Building, Denver; W. H. Bullock, Gas and Electric Building, Denver; J. C. Roberts, Golden, Colo. F. W. Whiteside is secretary-treasurer and E. H. Weitzel the president.

⁂

October a Big Month

The month of October has been a big one in the coal industry from the point of tonnage. As a matter of fact, when the tonnages are all computed it will be found to have been one of the biggest Octobers for many years. This is owing to many causes, the chief of which are the lack of household storage, buying during the summer, an extremely warm September and trouble looming on the horizon next April.

There is no doubt that this last factor will contribute largely to the tonnage for the next five months; so with weather anywhere near seasonable the coal business is sure to be really active for some time. No particular complaint is heard about collections these days, from either the shipper or the retailer, which is certainly an important consideration.

⁂

Winter Meeting of Coal Mining Institute of America

The Coal Mining Institute will hold its winter meeting at the Fort Pitt Hotel, Pittsburgh, Penn., on Dec. 21, 22 and 23. The business session will be held at 10 a.m. of the first day. At 1:30 the question box will be opened and the following questions read: To what extent has a machine been developed for mining and loading coal? Leaders S. A. Taylor and W. A. Weldin. What part should the gasoline locomotive take in mine haulage? Is the purchase of power advisable for coal-mining operations? Leader J. F. Jenks, general manager West Penn Electric Co.

At 6:30 p.m. the institute dinner at $1.50 per plate will be held and Sion B. Smith will speak on "The Bearing of the New Compensation Act on the Coal-Mining Industry of Pennsylvania," and H. B. Mellor will explain the mining extension work of the University of Pittsburgh, with which he is associated.

On the second day, Dec. 22, W. H. Howarth, the mine inspector, will discuss "Methods of Concentrating Mining in the Lower Connellsville District" and S. B. Belden, "The Use of Storage Batteries in Mines." At 1:30 p.m. Joseph Williams will give the advantages of permissible explosives and Joseph Knapper will point out their disadvantages. Edwin M. Chance will read a paper on "Mine Gases," and G. A. Burrell will describe a new methane detector.

On the third day J. H. White, of the Bureau of Mines, will discuss "Welfare Work in Its Relation to Workmen's Compensation" and H. M. Wilson, director National Safety Council, will read a paper entitled "Workmen's Compensation and Mine Safety with Reference to Cost of Producing Coal." Adjournment will follow at noon.

⁂

Anthracite Refunds

The refund of the Pennsylvania state tax on anthracite has been delayed pending a decision on the request for a rehearing made by the attorneys for the state. It is now possible that, by the time the issue on the law of 1913 is reheard and settled, action on the act of 1915 will contrive to keep the dealers in an expectant frame of mind.

In addition to this it is now rumored that the reduction of 40c. per ton on anthracite-coal freight rates to Philadelphia ordered by the Public Service Commission will soon be again brought forward by a final decision of the commission. It will be remembered this was to go into effect last January, but was appealed by the railroads. If by a fortuitous chain of circumstances the dealers should receive a refund on this account also, it would mean a great deal to them. It is also well to recall that the reduced freight rates ordered on anthracite to interstate points by the Interstate Commerce Commission are supposed to become effective Dec. 1, to which date the order was suspended on request of the railway companies for time in which to prepare their tariffs.

⁂

Market for Coal in Portugal

Prices of coal in Portugal, already double what they were before the war, are gradually increasing, says *Commerce Reports,* and the supply of fuel on hand is small. The latest quotations for Welsh coal are $10.20 to $10.70 and $11.90 to $12.90 c.i.f. Lisbon. Lower qualities bring $9.25 to $9.50. The English freight rate is also advancing and is now $4.15 to $4.85 a ton.

Local dealers generally admit that America could supply this market if freights from the United States were around $4.85 to $6.10 per ton. Some cargoes of Pocahontas coal have arrived here recently and are giving satisfaction, but on account of the high freight it is difficult for this fuel to compete in price with the Cardiff coal generally used in Portugal.

COMING MEETINGS

The Winter Meeeting of the Kentucky Mining Institute will be held this year at Lexington, Ky., on Friday and Saturday, Dec. 3 and 4, 1915.

Illinois Mining Institute will hold its annual meeting on Nov. 20, 1915, at Springfield, Ill. Election of officers will be held and the day will end with a banquet.

West Virginia Coal Mining Institute will hold its winter meeting at Fairmont, W. Va., on Dec. 8 and 9, 1915. Secretary-treasurer, E. N. Zern, Morgantown, W. Va.

The Labor Situation

SYNOPSIS—Subdistrict President O'Neill makes further charges against Colver officials. Progress is made in Illinois in the coöperative store business. The eastern Ohio miners finally ask for lower freight rates, and evidence in the Hocking district shows that railroads make excessive profits.

It will be remembered that Charles O'Neill, subdistrict president of the United Mine Workers of America, alleged that he was violently assaulted at the Colver hotel by parties who desired to prevent him from organizing the miners at the Colver mines. (For further information see "Coal Age," Oct. 30, p. 713, and Nov. 6, p. 758). O'Neill now brings a further charge to the effect that when he was riding in an automobile with James Mooney and Armada Pellizarri, organizers of the union, he was followed by two automobiles. One drew ahead of his automobile and stopped, thus trapping O'Neill and his friends. O'Neill alleges that in the automobiles were E. F. Saxman, general manager of the Ebensburg Coal Co.; his son, P. M. Saxman, superintendent of the mines; J. Sweisle, proprietor of a hotel at Colver, and J. A. Wilkinson, Ira Meyers and Richard Crouse, mine guards at Colver. These men, he says, jumped from the automobiles and dragged the three men from their machine and beat them till they were cut and bleeding. They then jumped into their automobiles and drove off.

A Strike in Violation of Contract to Arbitrate

The union in the Kanawha district has at last induced the few miners of the Montgomery Coal Co. to return to work. Their agreement required them to arbitrate their difficulty and prohibited them from seeking to obtain a decision in their favor by abstaining from work. They were idle for seven weeks, returning to work on Nov. 11. District Vice-President J. J. Cunningham and National Organizer H. D. Friel induced them to end the strike.

The labor situation in West Virginia and Ohio is so bound up with the question of freight rates, as is recognized by the operators, miners and the public, that further reference to freight matters is permissible in this column. As has been stated the West Virginia operators have for a long time felt that the 15c. increase in freight rates west would never be put in operation.

It has been announced, though not officially, that the Chesapeake & Ohio Ry. will not file tariffs with the Interstate Commerce Commission providing for the increased rate. George F. Randolph, first vice-president of the Baltimore & Ohio Ry., is quoted as saying that his road has made no definite decision on the subject. The Norfolk & Western Ry. appears also to be undecided. A largely attended meeting of operators has been held in New York City at which matters were discussed at length with the railroads. Another meeting is set for Nov. 17 and will be held at White Sulphur Springs, W. Va.

If West Virginia Escapes Higher Freight Rates, Ohio Will Ask For Lower Rates

The eastern Ohio operators have now made complaints before the Ohio Public Utilities Commission protesting against the rates charged for hauling coal by all the four steam railroads operating in that section of the state. In doing this they supplement the action of the district officers of the United Mine Workers of America in Ohio. They request that the court will reduce the rates to a point where they will not be "unreasonable and unjustly discriminatory."

The Pittsburgh Vein Operators' Association, comprising all the principal operators in Belmont, Jefferson and Harrison Counties, filed complaints against the Wheeling & Lake Erie, Baltimore & Ohio, Pennsylvania and the New York Central, in which it is alleged that the coal rates are "excessive, unreasonable and unjustly discriminatory." The Cambria Mining Co., which operates extensive mines in Belmont County, complained separately against the rates charged by the Pennsylvania R.R. Co. and on the same ground.

Though the complaint brought by the miners' organization soon developed into a contest between the Sunday Creek Coal Co., operating in the Hocking district, and the Hocking Valley and Toledo & Ohio Central, which railroads handle most of the coal from that district, the entrance of the eastern Ohio operators with specific complaints against the four coal-carrying roads in the eastern Ohio district gives promise that an adjustment of coal rates throughout the state will be made by the Ohio Public Service Commission.

It is probable that inasmuch as the complaints of the eastern Ohio operators were made separately from that of the miners' organization and the Sunday Creek Coal Co., the eastern Ohio rates may be determined in a separate decision from those of the Hocking district.

They were induced to ally themselves in the contest against the railways because they had ceased to hope that they would be able to secure an increase of West Virginia interstate rates. It is expected to be shown that many of the railway coal rates have not been changed or revised in a generation, although methods of transportation have in that time undergone almost revolutionary changes.

Large Profits Made in Ohio Coal Transportation

The most important development when the hearing of the complaint was resumed was the evidence of Rate Expert C. W. Hillman, who went over the books of the Hocking Valley Ry., which is one of the defendants in the case. This company is earning a profit of about 200 per cent. on coal shipments from Nelsonville to Columbus and about 85 per cent. profit on shipments from the former point to Toledo, Fostoria and Marion, according to Hillman. He testified that the total cost of shipping coal from Nelsonville to Columbus is 21c. a ton, for which the shipper is charged 65c.

The cost of moving coal from Nelsonville to Toledo is about 47c., while the shipper is charged 85c. for the service. Hillman's figures also covered other points on the line. He was aided in the examination of the company's books by several other authorities, including Beman Thomas, who is the commission's regular rate expert. The hearing will probably last at least 10 days.

Attorney John F. Wilson, representing the Hocking Valley Ry., tried to undermine the testimony of C. W. Hillman. Not only did he question Hillman's impartiality and bring out the fact that he is in the pay of the Sunday Creek Coal Co., which is the force behind the miners, but he also attacked the testimony at various points by attempting to get admissions that the estimates and calculations from the Hocking Valley's books and records are inaccurate and incomplete.

The matter may have importance later if the case reaches the Supreme Court after disposition by the commission. It is to the court that appeal must be taken by either party dissatisfied with the finding made.

The principal object of attack by Mr. Wilson was Mr. Hillman's division of charges as between freight and passenger traffic. Mr. Hillman insisted that any other methods than those he used in arriving at results would make but little variation in the final figures. He declared that in one case the difference was only $5,000 in a general item of $4,500,000, or less than one-half of 1 per cent.

Illinois, Arkansas, Oklahoma and Colorado

In Illinois coöperative store management is making continued progress. The Union Fuel and Supply Co., which is really owned by local No. 755, of Staunton, Ill., has just purchased the building of Jacob Moehrman in the Luker-Moehrman-Schmidt Block. A new warehouse will soon be built near the Wabash R.R. track.

As noted in the last issue, John P. White recently took charge of District 21 and appointed executive officers in place of Peter Hanraty, of McAlester, Okla., and William McLachlin, of Huntingdon, Ark. Apparently the charges against Hanraty, like those against Howat, do not prevent his being extremely popular. Both Hanraty and McLachlin received the majority of the nominations cast for the offices that they formerly held and recently resigned. All the district officers now temporarily dispossessed in District 21 are looking for reëlection, the date of which has not yet been set. District No. 21 covers Arkansas, Oklahoma and Texas.

In "Coal Age" of Sept. 25 were recorded the conditions leading up to the arrest of Horace N. Hawkins and Fred W. Clark, counsel for the United Mine Workers, on charges of subornation of perjury. Judge Wiley, of Alamosa, quashed this case in the district court. The case was filed by Fred Farrar, the attorney-general of Colorado, and the charge was inducing Grover Hall, a juror in the trial of John R. Lawson, to make untrue representations to the effect that he had been coerced into agreeing with the verdict of guilty.

In South Wales, England, it is reported that 50,000 miners tendered on Nov. 15 two weeks' notice that they would stop work until all the men employed in the collieries joined the South Wales Miners' Federation. It is time that strict measures of control be applied to this exceptionally disloyal union.

Editorials

Beneficiary Insurance Funds

There are many operators who have started beneficiary insurance funds. *Coal Age* is anxious to obtain some account of their operations for publication so that its readers who are desirous of establishing such institutions may have an opportunity to model them on the basis of the more successful of such funds. Recently an inquiry was received asking for information, and the answer made was distressingly meager, the companies that had established such funds having been painfully modest.

⁂

The Trend of Conditions on New Coal Contracts

This is ordinarily not a season during which many fuel contracts are placed. Orders such as that at Auburn, Me., for county buildings (p. 738) awarding 500 tons for less than $4.75 for Georges Creek, however, show a normal condition for this time of year. While the Bay State Street Ry. purchase of 15,000 tons of New River (p. 738) and that of the City of Boston for 12,500 tons (p. 787) were both cases of emergency buying, partly to secure extra supplies and partly to replace coal that had been deemed unsatisfactory, the prices showed the strength of the market for spot delivery and for shipments between now and Apr. 1.

The Crocker-Burbank Co., Fitchburg, Mass., order (p. 738) for 50,000 tons of Georges Creek for 12 months from Oct. 1, also an out-of-season contract, is understood to have been placed at full circular prices, but contracts made for the year beginning Apr. 1 are on an entirely different basis.

The announcement early in October (p. 662) that one of the large distributors would name a low price for handling coal for delivery inland from Mystic Wharf, Boston, Apr. 1, 1916, to Apr. 1, 1917, has led to marked developments. From a handling charge that meant $3.60 on cars Boston if the Hampton Roads base figure continue $2.85, quotations have through competition slid down 25c. to $3.35, and probably the bottom is not yet reached. Thus we have a novel situation—prices for shipments prior to Apr. 1 quite firm, and deliveries for a year thereafter as low as any season quotation in years and with a "protection" against a further decline. A large tonnage has already been covered in for the next contract year, but for the most part it has been closed along the usual channels; that is, by shippers holding the business the current year. There are cases, however, of large tonnages being bid away by aggressive merchants, and there are cases of reprisal in plenty. All told it is unwholesome price warfare and doesn't augur very well for operating returns. The contracts closed are of the kind that are placed within limited circles and are accessible only to dealers in close personal touch.

For a time it was expected this "soft spot" would be strictly confined to inland trade "on cars Boston" and to points where other distributing ports like Portsmouth, Providence, etc., compete with Boston, but the same indications are now appearing in quotations made alongside dealers' wharves—first those accessible by lighter from Boston and latterly places accessible to steamers and barges.

The only contract activity in the Philadelphia market has been in the municipal business. The deficiency contract (No. 1573, pp. 699, 828) recently awarded by the Water Bureau was taken at very much higher prices, there being an almost complete change of contractors. The trade shows very little willingness to enter into new contracts on account of the expiration of the agreement with the miners at the end of March. This is shown by a number of small contracts going begging, such as schools and institutions. Many of these have delayed buying until now, and find few and in some instances no tenders at all for their business, compelling them to purchase at the market rates.

Usually at this time of the year the anthracite operators begin to tie up their steam users to contracts for the new year, but up to this time no effort whatever has been made in this direction, although some of the companies have announced their willingness to carry customers on the old contracts until the end of March. These are isolated instances, however, and it is expected that the companies will soon solicit their regular contracts, the delay seeming to be due more to uncertainty as to what the prices will be.

In Ohio one of the larger office buildings has laid in its supply at $1.75 per ton for Hocking nut, pea and slack delivered, while the same quality of coal was bought last year for $1.65.

The price at which the City Council of East St. Louis awarded a contract to the William Helfrish Coal Co. (p. 662) for furnishing about 1,000 tons of 2-in. shaker-screened coal to the city departments was $1.60 delivered, which was regarded as a favorable figure.

⁂

Paying Mine Workers Both for Time and for Output

The public is quite generally of the opinion that the wage based on performance—the piece or ton wage—is the one which makes most certainly for efficiency, but it may well be doubted whether that popular idea is true. A certain definite wage for a certain amount of output is eventually set, and increased advantages to the operative which will enable him to do more work are not allowed to alter the output wage.

As a result there is no tendency on the part of the employer to aid his employee by improving conditions after any of the known methods, such as training the workman, routing his work, providing him promptly with the material for his labor, speeding his machinery or providing him with efficient tools.

Thus while output wages make the workman more efficient, they make the operator less disposed to provide for economy. As a result the outcome is probably less favorable than if the workman had no interest in effective labor, and his employer by harrying him could gather in all the profit resulting from proper methods of operating. In coal mining the operator has his coal mined at a certain price per ton, say 50c. So long as there is such a scale fixed, the operator feels no direct need to enable every man to produce a big tonnage.

In hauling the coal, in dumping and cleaning it, in providing power to mine it, the operator can make economies, but in the mining of it 50c. per ton is for him the unvarying rate, so that on about two-thirds of the cost he can make neither savings nor losses.

He may fill up his mines with unnecessary men; he can start the plant in the morning without railroad cars available and shut down the tipple after a few hours of perfunctory work; he can let the men go in to load and find their places not cut; he can permit the undercutters to find their rooms occupied by loaders; he can allow the workmen to be hampered for lack of power or of pumps or to be hindered by drivers or trackmen, or he can tie them up by bad ventilation or antiquated or expensive methods of working, and still the rate is 50c. per ton—the scale rate of the district—for there is no premium on the operator's coöperation with his men.

The workman may well be efficient out of pure honesty of disposition or solely because he likes to work hard. There are such men, but they are of course only too few. But with operators mere honest intent, mere alertness to seek the good of the workman is not enough. The mine owner and his superintendent may be both honest and alert and yet do the workmen and the state much harm.

For to get a perfect coördination between railroad employees, trimmers, rock and coal dumpers, drivers, cutters, loaders, tracklayers, pumpers and engineers involves the hiring of many bosses and the laying out of the workings at much expense to produce these results. Also sometimes the daymen whom the operator must pay must lie idle to afford the miners a chance to work. The purchase of much equipment and machinery is also necessary to enable the miner to put out a good day's output.

For the advantage of the day hands all aids to coördination and to effective output are well justified, for the operator can save by carefully watching his opportunities, but that rate of 50c. per ton to the miner and loader cannot be reduced. It is a stumbling block to economy.

For a long time it retarded the introduction of steel rails into rooms and prevented the use of reliable partings at the room necks. At one time the operator provided the props any length he chose; the men could always cut them to length on their own time. In many cases the men were asked to wander around the mines to find spikes and ties and rails in unspecified chambers and required to drag them to their own rooms for relaying. And this because the operator had no interest in efficient mining, whatever he might have in efficient transportation or dumping.

That 50c. per ton is fixed; there is no chance for him to clip it. There are many ways in which by better machinery, more superintendence, better management, more suitable equipment, training of the men and new methods of working that 50c. could be cut with benefit to both operator and miner, but one cannot blame the latter for opposing such a cut, for he cannot be sure that the advantages promised will be all they are alleged to be or will always be forthcoming.

The operator honest and alert to help the miner cannot be asked to give up his only hope of not losing money to help out the miner in this dilemma. His profits are dependent on his success in cutting down the wages of superintendence, in speeding the drivers and other day hands and on eliminating the dead work and like costs, while helping the miner tends largely to involve the operator in failure.

The interests of the miner and his employer should be one, but with our output wages the employee appears to get all the benefit. As a matter of fact he retains too much of the profit for his own good, and the employee as in all cases where an unequal bargain is driven is really the loser. Neither party can really afford to make such a contract. Nor are such agreements profitable to the state.

In fact a combination of a minimum wage plus a lower rate of remuneration per ton of output is the logical way to pay for every operation around the mine. There would be no reason then to pay for abnormal places, for cutting necks or crosscuts, for clay veins or other difficulties. The minimum rate would secure pay for the miner for all these disadvantages.

By enabling the workman to do a large day's work the operator would secure a larger output for less money. No longer would mines be filled with men above their hauling and loading capacity or beyond the ability to wash coal or use it at the ovens. The day-wage part of the contract would hinder such needless hiring of men. Nor would there be much loafing at the work, for the output wage would tend to prevent it.

But still it would be necessary perhaps to provide for hurrying up the do-less ones by providing some method of watching the work. That could be done by providing a method of longwall retreating by panels with a conveyor system, thereby concentrating the work.

⁂

An Invitation to Co-operate

We are particularly desirous that all our new readers who have come to us through the consolidation of *The Colliery Engineer* with *Coal Age* shall understand our definite policy in the matter of contributions to our editorial pages. From the beginning of its existence this paper has sought to encourage the submission of articles, letters and discussions from subscribers, with the idea of increasing the value and interest of the reading pages. We have stated frequently, and repeat now that *Coal Age* is an open forum for the expression of opinions by all responsible coal-mining people. Such views need not correspond in the least with the opinions held by the editors; in other words, the paper is the mirror of the entire industry and not a reflection of two or three individuals.

If you have never sat down and put some of your experiences or ideas into writing suitable for publication, start now by sending us a contribution for our Electrical Number, Dec. 4. Pick out the most interesting subject you know of pertaining to the use of electricity in mines and get the facts out of your system and into print. All such articles that are published are paid for; but that is the smallest part of the value received by you, for it is a fact that no work you can do will be more profitable in the way of increasing your education, multiplying your friends and extending your reputation than literary efforts in your chosen vocation.

Sociological Department

A Wyoming First-Aid Meet

By Thomas Gibson*

SYNOPSIS—Southern Wyoming gathered at Rock Springs for a first-aid contest, one team coming 159 mi. from the east and two others from a point 103 mi. in a westerly direction.

The southern Wyoming operators held the first of a series of first-aid meets at the Ball Park, Rock Springs, Wyo., on Labor Day, Sept. 6, 1915. At this meet representatives were present from the Union Pacific Coal Co., the Gunn & Quealy Coal Co., the Kemmerer Coal Co. and the Superior Coal Co. In charge of the event was J. J. V. Forbes, a first-aid instructor of the Bureau of Mines, who also announced the events.

The meet opened at 9 a.m., all the first-aid teams present assembling at the first-aid hall of the Union Pacific Coal Co. to take part in the Labor Day parade. There were eight first-aid teams in the line of march, and they were headed by the boys' band. Thousands of people lined the sidewalks to see the marching hosts, and the first-aid men availed themselves of the opportunity to perform some first-aid work for the benefit of the spectators. Their skill was awarded with much applause.

On their arrival at the ballground, Thomas James, chairman of the city council, on behalf of Mayor Anderson welcomed the many men, women and children assembled to view the contest.

The executive committee consisted of D. G. Thomas, mine superintendent of the Rock Springs mines; Thomas Gibson, chairman of the bureau of safety, Union Pacific Coal Co.; John Maxwell, mine foreman; John Sorbie, secretary of the first-aid organization; Joe Trayer, assistant superintendent; Matt Marshall, miner; Ralph Buxton, mine foreman; Charles Gregory, assistant mine foreman; Thomas Foster, mine foreman; George Smith, miner, and J. J. V. Forbes, first-aid instructor. The space marked off on the ground in which the work was to be performed measured 40x148 ft. A supply base measuring 8x8 ft. was alloted to each team for the purpose of keeping first-aid supplies. A space of 12 ft. was maintained between the team bases so as to systematize the work. All the first-aid events were performed in a space measuring 8x40 ft. immediately in front of the supply base. This arrangement afforded the thousands of spectators in the grandstand a clear view of all the first-aid events.

DOCTORS AND COMPANY MINE OFFICIALS DO THE JUDGING

The following doctors and mine officials judged the first-aid events: Drs. J. H. Young, G. E. McDonald, J. H. Goodnough and C. F. Moon; mine officials, F. S. Davis, William M. Hartman, F. L. McCarty and Joe Traher. The progressive system of judging was adopted.

TEAM FROM ROCK SPRINGS NO. 8, WITH VISITORS

From left to right—T. Gibson, chairman, Bureau of Safety; T. A. James, Rock Springs City Council; R. D. Oliver, miner; J. Overy, miner; T. Radalj, miner; H. Miles, cager; M. Marshall, machine runner; T. Scott, motor runner, and E. Dunn, miner, captain

With the assistance of J. J. V. Forbes, I selected the following program of events. What these were was not revealed to anyone until the teams were on the field and ready to demonstrate their skill.

One-Man Events—A miner who has been overcome by powder smoke in his working place is found to have sustained a simple fracture of the right forearm. Remove 20 ft. to entry and treat. Time allowed, 8 min.

A miner has a severe cut on the right temple which is bleeding. The right side of his jaw is cut, and he has a simple fracture of the right collarbone. Time allowed, 8 min.

Two-Man Events—A driver is caught between two mine cars. His right eye is badly bruised, his right shoulder-blade broken and his right ear is torn. Remove 20 ft. and treat. Time allowed, 8 min.

TEAMS OBTAINING FIRST AND THIRD PLACES AT MEET, WITH MINE OFFICIALS

From left to right—Dr. G. E. McDonald, of Superior; G. A. Brown, mine foreman, captain; F. Swanson, electric machine boss; F. L. Davis, superintendent; E. Tinkler, miner; S. Traher, assistant mine foreman; F. Pellican, electrician, and C. Albertini, miner, all from Superior, and three others from Rock Springs who couldn't help associating with the winners; D. G. Thomas, superintendent at Rock Springs; J. Traher, general inside foreman at Rock Springs, and J. Doak, inside engineer No. 7 mine at the same place. Farther on, from left to right—J. J. V. Forbes, first-aid instructor, Bureau of Mines; G. B. Pryde, general superintendent; T. Hartney, material clerk; R. Knox, driver; J. Wise, miner; J. Goddard, electrician; C. Gibbs, tracklayer; W. Reid, machine runner, captain; F. L. McCarty, superintendent; Dr. C. F. Moon, visiting physician from Omaha; Dr. J. H. Goodnough, of Reliance, and C. Durham, general outside foreman

---

*Chairman, Bureau of Safety, Union Pacific Coal Co. and Superior Coal Co. mines.

A miner is found unconscious, lying face down on a live electric wire, with abdomen badly burned. Rescue and give treatment.

Team Events—A miner is found with a broken back. Treat and carry him 25 ft. on a stretcher and place him in an upright position. Time allowed, 14 min.

On a shot blowing out, a shotfirer has his right eye badly injured, his right arm broken below the elbow and his left ankle sprained by a fall. Transport 50 ft. with an improvised stretcher. Time allowed, 12 min.

A mine worker has suffered a compound fracture of the middle of the left thigh, with profuse arterial hemorrhage, and a cut from the outer corner of the right eye to the top of the right ear, with bleeding. Time allowed, 15 min.

A powder keg has exploded, burning a miner severely on face, neck, chest and both hands. Carry 25 ft. with improvised stretcher and attend. Time allowed, 12 min.

FIRST PRIZE GOES TO SUPERIOR MINE TEAM

The first prize, a free trip to the Panama-Pacific Exposition, where the contestants were to compete for interstate supremacy, was awarded to the Superior Coal Co. team, Superior, Wyo. This prize was purchased from funds provided by the Union Pacific Coal Co., Gunn & Quealy Coal Co. and the Kemmerer Coal Co. The team scored 780 points, or 97½ per cent. of a perfect score. The names of the winners are G. A. Brown, captain, Steve Traher, Ed Tinkler, Frank Pellican, Charles Albertini and Frank Swanson.

The team from No. 7 mine, Rock Springs, Wyo., Union Pacific Coal Co., took second place with 773 points, or a rating of 96⅝ per cent. The names follow: Charles Gregory, captain, William Black, Mike Palko, B. Dallabetta, Archibald Auld and John Sorbie. The prize which this team received consisted of $10 which had been contributed by the Labor Day committee.

WINNERS OF SECOND PLACE, ROCK SPRINGS NO. 7

From left to right—J. Maxwell, mine foreman; C. Gregory, assistant mine foreman and captain; B. Dallabetta, timberman; W. Black, motor runner; A. Auld; M. Palko, miner; J. Sorbie, motor runner, and T. Thomas, driver

The third place went to the Reliance, Wyo., team with 764 counts and a percentage of 95½. The team comprises the following members: William Reid, captain, Charles Gibbs, Joseph Wise, John Goddard, Robert Knox and Thomas Hartney. The "Journal of the United Mine Workers of America" of Indianapolis, Ind., presented six one-year subscriptions to this team in recognition of its securing third place.

The team of mine No. 10, Rock Springs, made 759 counts, equivalent to a percentage of 94⅞. Thomas Foster is captain and the team consists of George Smith, Frank Vahar, Andrew Bone, Stanley Preece and Robert Smith. Mine No. 8 at Rock Springs was fifth in order, with 757 counts and a percentage of 94⅝. The captain is Ed Dunn and his corps consists of Thomas Scott, Matt Marshall, Harry Miles, Tony Radalj and Joseph Overy.

The Hanna team of the Union Pacific Coal Co.—Thomas Town, captain, Thomas Hughes, Alfred Cheebrough, James Meekin, R. S. Barrie and Thomas Meekin—took sixth place and received 758 counts, or a percentage of 94¾. Cumberland No. 1 mine of the Union Pacific Coal Co. was represented by a team comprising F. O'Connell, captain, William Goddard, J. L. Faddies, Peter Boam, William McLean and William Gibbs. This team took seventh place, with 730 counts and a percentage rating of 91¼. The last place was secured by Cumberland No. 2 mine of the Union Pacific Coal Co. This team made 716 counts and a percentage of 89½ per cent. J. D. Jones is captain and the other men in the team are John Smith, Dan Jenkins, John Buchanan, Lyman Fearn and Nels Nelson.

At 9 p.m., the first-aid teams and the officials connected with the meet assembled at the First-Aid Hall, Rock Springs, for a smoker. After cigars were passed around, the chairman of the first-aid society, John Maxwell, called upon a number of officials and guests, who responded with short talks bearing on the future plans for increasing the scope of first-aid work throughout the state and complimenting those in charge of the meet for the systematic manner in which the meet was conducted. The affair was pronounced a great success by everyone present.

Sociological Notes

The Cost of Living Declined 5 per cent. between Oct. 30, 1914, and the same date in 1915, and 6 per cent. between Jan. 3, 1915, and Oct. 30, 1915, according to the New York "Times."

A Delayed Shot Killed Two Miners at Silver Creek Colliery Oct. 22, blowing them into such small fragments that the first-aid corps gathered up the remains in sacks.

A Special Rate for Drinking Water in Tanks of $1 per tank has been established by the Colorado & Southern Ry. for the arid coal camps of the southern district. This rate has been approved by the state Public Utilities Commission. The rate is regarded as quite low, though the haul is in every case not long.

The Rockefeller Foundation Will Spend $100,000 for the erection of model Young Men's Christian Association buildings throughout the State of Colorado. They will be erected in all but the smallest camps, but they will not be used to replace the present clubhouses, which are to be made more comfortable and uptodate in every particular. They are to include gymnasiums, swimming pools and libraries and will be splendidly equipped throughout.

The Superior Coal Co. is holding mine foremen's meetings at Superior, Wyo., and at these much interest is manifested in the discussion of vital problems in mining and management. The following meetings have been held: Nov. 3, "Haulages, Methods and Costs," Mr. Brown, chairman; Nov. 11, "Timber and Timbering," Mr. Dykes, chairman; Nov. 17, "Machines and Machine Mining," Mr. Whalen, chairman. Two further meetings have been arranged: Nov. 24, "Blasting and Drilling," Mr. Hicks, chairman, and Dec. 1, "Material and Requisitions," Mr. Paulson, chairman.

At Assumption, Ill., a Miners' Night School has been started by the Assumption Coal and Mining Co. It is intended principally for mine employees, but it is open to everyone who wishes to avail himself of the opportunity. To date, 52 men and boys have enrolled. The teaching staff consists of Professor Stanberry, T. A. Devlin, a high-school graduate and later of the engineering department of the University of Illinois, and Albert Palmer, graduate of the normal school and a former school teacher. The class has elected the following officers: T. J. Connolly, mine superintendent, president; F. E. Taylor, electrician, secretary; and A. Palmer, machinist, treasurer.

The Colorado Fuel and Iron Co.'s Industrial Bulletin, a quarterly periodical measuring 8x10⅝ in., was issued first in October of the present year in accord with the agreement between the company and the mine workers in that month. It has an illustrated cover and 31 pages of type matter and illustration. It contains a list of the officers, mine superintendents and employees' representatives, a letter from the president, J. F. Welborn, some notes of interest about the John D. Rockefeller, Jr., trip, full-page illustrations of Rockefeller and of the conferees at Pueblo on Oct. 2, an open letter from Rockefeller in four languages, the Rockefeller address, the plan of representation, the memorandum of agreement, a diagram representing the method by which grievances can be adjusted, a summary of the voting and an account of the public-school conference.

The State Mine at Wonthaggi in Victoria, Australia, is the largest coal producer in that island continent. After allowing $224,541 for "depreciation, sinking fund, etc.," a net profit of $5,895 was obtained in the fiscal year ending June 30, 1914. The output was 2,576 short tons per day, and about 1,000 men were employed, only 450 of whom were mining coal on contract rates. The total output of coal for the fiscal year already mentioned was 616,120 short tons, valued at $1,203,083. The price was therefore $1.95 per ton. The miners averaged $3.40 per shift. The output obtained constituted 89 per cent. of all the coal mined in the province of Victoria. The price obtained for the coal is generous, the wage not inordinately large and the profit beggarly. It all goes to show that mining is being conducted with better results to all concerned under the capitalism of America than under socialism in Australia. It may be noted, moreover, that the "depreciation, sinking fund, etc." is large, being 18.66 per cent. of the value of the output, or 36c. for each ton mined. The profit was larger in the year preceding that under discussion, when it was $201,110.

Discussion by Readers

Store Checks vs. Thrift

Letter No. 3—There is no doubt that thrift among the mining classes is one of the most important questions that coal operators will have to face in the near future as being the only means of putting the mining industry on a firmer basis. The lack of thrift among miners has caused them to demand mining rates that have been prohibitive in many districts and coal fields, and those districts have suffered as a result.

Observation shows that the average miner is living from day to day with little or no thought of the future. Many do not care to work every day when they have a chance, but aim to make just enough to cover their store accounts. It is unnecessary to remark that a miner of this class has lost his ambition. He cares little how long he remains in one place, since he has not established a home that will make him contented to spend his evenings with his family. In fact a comparatively small proportion of mine workers have many things that make life worth living. These are the men whom one finds lounging in the company store after working hours. They can tell you how they would run the mine if they were boss, but they never realize that they are themselves the biggest obstacle with which the boss has to contend.

CONDITIONS SURROUNDING THE MINER

When the mines are working full time, the average miner should be able to make from $60 to $65 a month clear. While it is true that no man would get rich on this income, it is likewise true that if used in the right way the money will keep a medium-sized family in fairly good circumstances. For example, compare the average miner with his brother workman in the factory or the shop. By attending to his work and saving his wages, this man manages to buy a little home, though his earnings are often not as large as those of the average miner. This comparison shows that there must be something radically wrong in the attitude of the miner toward his work. He can make good money if he will, and he has every opportunity to save his earnings, as his expenses in a mining town are not great; but how rarely he does this.

The problem presented to coal operators by reason of this condition in mining towns is the providing of suitable means whereby their employees will be able to get the most for their money and at the same time to encourage them to save a part of their wages and to put this aside as a bank account. If the men can be induced to do this, it will generally prove a greater incentive to work and to improve their circumstances than anything else.

I have observed many improvements in the management of the company store, but it is a fact that the higher mine officials often value a man according to the amount he spends over the counter. He may be the most worthless fellow in the mine, but the foreman is unable to get rid of him on any pretext whatever. The man may not do 50c. worth of work in a shift if employed as a dayman, but the fact that he is getting $2 a day and leaving every cent of it in the store is sufficient to keep him on the payroll. A little reflection should show the management that this is a "leak in the payroll" that should be stopped. Where this condition exists it is easy to see that the commissary receives the first consideration. I am glad to say, however, that this is not the case in every mining town.

THE PURCHASING VALUE OF SCRIP

Few miners consider the value of scrip equal to that of the money it represents. In most camps scrip can be purchased at from 75c. to 90c. on the dollar, and it is handled with about as much care as so much old paper. A child is sent to the store with $5 or $10 of scrip, when it would not be trusted with the same amount in good old greenbacks. Purchases with scrip are often made with the same careless disregard of the value represented.

This failure to regard the money value of scrip is increased in many cases by the urgency of the store manager, who often induces a customer to buy goods that he really does not need. It is still a common practice for some companies to hire a store manager at a small salary and give him in addition a percentage on the sales he makes. Such an arrangement is productive of more harm than good, as it tends to impoverish the customer and in the end works against the best interests of the company. The light esteem in which the company scrip is held by the average miner makes his purchases in the store seem to him like getting something for nothing.

CAN A COMMISSARY BE RUN WITHOUT SCRIP?

I realize that commissaries are a necessity in many mining camps, but there is no reason why the scrip system cannot be abolished. This might cause some inconvenience for awhile, but the results would more than repay the operators for their trouble in making the change. I want to suggest that a commissary could be run to advantage on a profit-sharing system and stocked with the best grade of goods that can be sold to the mining trade at a fair profit. Then, at the close of every six or twelve months, after deducting a certain amount for running expenses and interest on the money invested, the remaining profit could be divided among the employees in proportion to the amount of their several purchases. It might be well to make the rule that only those employees who have been with the company for a certain length of time would be included in the profit-sharing scheme. I believe that such a system would tend to rapidly reduce shiftlessness among miners. A similar system has worked wonders for certain street-car companies, and it could certainly be adapted to the commissary trade.

NEED OF A BANK OR DEPOSITORY

While discussing the store system, let me suggest that it would be a good plan to have a bank or depository established in all mining camps, where miners could make deposits every payday, putting aside a portion of their earnings. I have in mind a certain mining district where several such banks have been established and are operated as purely commercial banks, but no systematic effort is made to induce the miners to patronize them. On the other hand, in some cases such a bank even goes so far as to furnish the company with pay envelopes bearing the address of the bank and commenting briefly on the advantage of a bank account to every man. This has the effect of reminding one when he draws his pay that it is good policy to start and keep up a bank account, no matter how small the deposits he may make.

Logan, W. Va. C. J. FUETTER.

Letter No. 4—If the average miner's wife were permitted to talk to the mine official referred to in the Foreword entitled "Store Checks vs. Thrift," *Coal Age,* Oct. 16, p. 619, she would unburden her mind to him about as follows:

"The fact that you did stop and think means that you are really interested in your employees, but if you were more fully acquainted with the conditions under which the miner's wife labors in her efforts to supply the daily needs of her family, you would know that the removal of the check system as a means of promoting thrift among your employees is based on a fallacious foundation."

With all due respect to men, the average experience of miners' wives is that their husbands habitually spend more than they can afford because they have been so long accustomed to support only themselves. I want to say that the check system is a blessing to the large majority of miners' wives because it gives them an available credit in the store that permits them to purchase the needed supplies for the family. When living at mines where the check system was not employed, the children and myself have often gone without suitable food and clothing, owing to my husband spending the money for things that were not needed in the home.

REASONS FOR HIGH COMMISSARY PRICES

It is true that commissary prices are often outrageously high. In some cases it has taken all that my husband could earn to buy the absolute necessities of life. I have sometimes wondered whether the peonage system in Mexico can be much worse than the conditions prevailing at many of the coal mines in this respect. The reason for these high prices is to be found in the fact that the storekeeper is instructed by the management to make a certain percentage on his goods, which is the only requirement. Many storekeepers come to understand that whatever they can make on the goods beyond this requirement stands to their credit.

Naturally, the storekeeper is not a very energetic man. He generally considers that if he sells a pair of shoes at 100-per cent. profit, the gain will be greater than to sell three pairs of shoes at 30-per cent. profit, and the transaction will cost him less effort. He applies the same principle to all the goods in the store. The charge for staple goods is generally 5c. more per can than elsewhere, and the price for meat practically forbids its purchase by most of the miners.

The natural result of these conditions is that a large proportion of the miners cash their checks at 20-per cent. discount and go into town, where they can buy the same goods for less money. There is often a great difference in the prices asked for goods in different camps. I have known a $5 purchase at one camp to be equivalent to an $8 purchase at another adjoining camp, with the result that the latter place drew the trade from the former.

Listen to what another woman might say, were she given the opportunity to unburden her mind in reply to the reflections of the president of the coal company as described in *Coal Age.* It would be about as follows:

"Our president has never come to look into the welfare of his camp as you have done. He knows nothing of the existing conditions and does not realize that he is getting his coal mined almost gratis. His mind is absorbed with the one idea of making money. His instructions to the storekeeper are, 'Put your prices as high as you can'; and they are certainly exorbitant."

After listening to this testimony, does it occur to any coal-mining president that the removal of the check system at the commissaries will lessen the burdens of his employees or remedy the existing evils?

THE OTHER SIDE OF THE QUESTION

The study of this question suggests that more would be accomplished if, instead of removing the check system as applied to commissaries, the management would instruct the storekeeper as follows: "You are required to make a certain fixed profit on the sale of goods, and no more. We would prefer that you sell three pairs of shoes at 30-per cent. profit rather than one pair at 100-per cent. profit. By so doing, you will hold the trade of the entire camp and satisfy our employees. Failure to follow these instructions will forfeit your position with the company." In addition to these instructions, the management might occasionally send a man around to see that his orders were carried out.

Following up the same line, the instructions to the superintendent should be to encourage gardening by every means in his power and to see that fertilizer and proper fencing are supplied at a nominal price (or better, at cost) to all living in the camp. Proclaim a gardening day when the mines will be shut down to give the men an opportunity to perform the necessary work in starting their gardens; also see that housewives are provided with such conveniences for their work as will tend to conserve their energies, that they may have some time and strength left for tending gardens. It may be suggested that the raising of garden vegetables will reduce the sales at the commissaries. There is little fear of this, however, as the money thus saved will be spent for other things at the stores, and a higher type of living will result.

By following these suggestions, let me say that the mine management will be teaching us thrift both by precept and example, and we will not be slow in catching the spirit manifested.

EXAMPLES OF GOOD COMMISSARY MANAGEMENT

B. F. Roden, owner and operator of the Roden Coal Co., Marvel, Ala., stated, in the beginning, that he was in the coal business and not in a mercantile business; that his commissary was to be run for the convenience of his employees. His storekeeper went to surrounding camps and towns to obtain price quotations, and his prices were brought to the same level or slightly lower. The result is that there is established at this mine an uptodate department store, which does a large business both inside and outside the camp. This is an example of what can be done in this direction by a small company. In addition to this, gardening is encouraged throughout the camp.

The Tennessee Coal, Iron and Railroad Co. is another example of good commissary management. The storekeepers of this company are instructed to make no more than a certain percentage of profit, which is low. The prices of all staple goods are fixed and subject only to market changes. Each storekeeper is required to send in a monthly report on his prices, and if he has overlooked any of the general market quotations to which his prices do not conform, he is promptly advised of the same. It is the custom in these stores to make small change and to cut the price below the usual nickel or dime when this is possible. If a customer presents a 10c. check in payment for an 8c. purchase, he is given 2c. in change. I want to ask, Is not this teaching thrift by example rather than by precept?

Results of Good Commissary Management

Experience has proved that commissaries conducted on the plan just described are proverbially successful. They build up a large trade and are patronized by the country for miles around. When fully carried out, the plan makes it optional to the miner or company employee whether he trades at the store or not. Also, he can either use the check system or, if he prefers, draw his money on payday and purchase his goods for cash. But a dollar in cash or in checks always buys a dollar's worth of goods. Thus, many of the burdens are lifted from the miner's wife. Companies that have adopted these plans give much attention also to the encouragement of gardening. Prizes are offered for the best gardens and lawns, and the companies often furnish the fertilizer, besides doing the plowing of the gardens.

In closing I want to emphasize the point previously stated—that the adoption of these methods is a greater schooling in thrift than can result from the abolishing of the store-check system. I want to suggest that, for the protection of the miners in many camps, it might be well for the mining department in the state to make and enforce rules regulating commissary prices on the necessities of life. A Miner's Wife.

Wylam, Ala.

A Flooded-Mine Proposition

Letter No. 2—Referring to the inquiry in regard to a flooded mine, *Coal Age*, Oct. 16, page 646, what strikes me most forcibly is the risk that was taken in driving rooms 40 ft. wide in the direction of old and abandoned workings. To the onlooker this seems to be the height of foolishness. It may be true, of course, that the management of the mine and the engineers were not to blame, owing to an incorrect survey and map of the old workings. Had this map been correct and available, it would have shown how far it was possible to drive the rooms in this mine and still leave a safe solid pillar of coal between it and the old workings. The map of the abandoned mine would also give an idea of the body of water accumulated therein. If complete, it would also show if the dip mentioned as existing at the face where the water broke through was a general dip.

Assuming that the seam is fairly flat, as stated in the reply to this inquiry, it is probable that the reduction in the quantity of water flowing into the new workings is largely owing to a decreasing head of water in the old mine and not to be wholly attributed to the heaving of the bottom. This would also be the case if the abandoned workings lay mostly to the dip of where the machine mined through the pillar.

Considerations in Building a Dam

The plan of this section of the mine given on page 646 does not show the distance that No. 4 room is driven ahead of No. 5. The pillar between these two rooms being only 4 ft. thick is not sufficient to give a firm foundation for a dam across the face of No. 4 room. In building this dam, therefore, as it will be necessary to cut in on both ribs in order to secure a good foundation, this can only be done safely when No. 4 room is from 12 to 15 ft. ahead of No. 5 room.

Assuming, as suggested, that the head of water is 100 ft., the pressure would be $62.5 \times 100 = 6{,}250$ lb. on every square foot of the dam. The room being 40 ft. wide and $4\frac{1}{2}$ ft. high, the total pressure on the dam is $6{,}250 \div 2{,}000 \times 40 \times 4\frac{1}{2} = 562.5$ tons, which would require a strong foundation. It will also be necessary to cut the roof and floor in the same manner as each rib and to a depth that can be determined only by the nature of the strata. I should adopt the method of first building a substantial bulkhead at least 3 ft. thick on a curve convex toward the face of the coal. While this work is being done, it will be necessary to make adequate provision for taking care of the water, and to do this, pipes or manholes should be laid in the bottom of the dam. When the work is complete, these pipes can be closed by a plug drawn into the opening from the inside by means of a chain and tightened by a screw or lever so as to make them water-tight.

Having completed this bulkhead, I would adopt the plan suggested by *Coal Age*, taking the additional precaution, however, of lining the inside of the bulkhead with a layer of horse manure or moss, which would greatly assist in preventing leakage through the dam. Depending largely on the strength of the bulkhead already built, I would make the concrete wall on the inside of this bulkhead, say, 24 in. at the bottom with a less thickness at the top. I would employ a mixture of one part cement and two parts fine sand, with sufficient water to enable the concrete or grouting to be handled readily.

If there is not sufficient room at the face of No. 4 room to give a good foundation for the dam, it will be necessary to build good dams across the left-hand crosscuts in No. 4 room and the right-hand crosscuts in No. 5 room. Anon.

——, Penn.

[The foregoing letter was unsigned. The plan of building a dam from room pillar to room pillar, as described by this correspondent, is certainly a precarious one. The suggestion made in *Coal Age*, page 646, was to grout in, solid, the faces of rooms 3, 4 and 5, and others if necessary, which could only be determined by test boreholes drilled in the face of each of the rooms in this block of coal.

We would suggest that, under the assumed head of 100 ft., no actual dam would be safe built across the face of a room 40 ft. wide. As has been suggested, however, it is very probable that there is no great head of water to be encountered in this case, since the formations are generally level. But, by building up the faces of all rooms, where it is found to be necessary, with solid concrete, as we suggested, to a depth of 8 or 10 ft., there should be no further danger from the water breaking through into the live workings.

Of course, no further work can be done in this section of the mine without keeping boreholes a considerable distance in advance of the working faces. If possible, the water should be drained from the abandoned mine and an investigation made to find the extent of the workings in that mine.—Editor.]

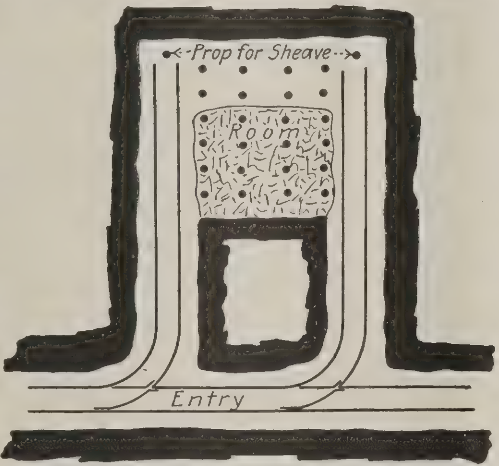
⁂

Handling Cars on Pitches

Letter No. 1—The inquiry on this subject by "Mine Superintendent," *Coal Age*, Oct. 23, p. 687, is so thoroughly answered by the editor that there is not much to say in addition. But as I have had some experience with double-track, gravity or self-acting planes in rooms and believe they can be used successfully on any pitch over 5 deg., I may be able to offer some practical suggestions.

Instead of using a piece of chain or cable to fasten the sheave clevis to the prop, I have used a solid ring, which the blacksmith can make in a few minutes of round iron or scrap if it can be found. This ring should be large enough for any prop and is slipped over the bottom of the prop before setting it.

Instead of using a single sheave, which necessitates the tracks being close together and does not permit of the car being pulled up close to the prop, I would suggest driving the rooms double, as shown in the accompanying illustration, and laying each track along the rib. Then set a post for a sheave at the head of each track and extend the rope along the face of the room between the sheaves. This will allow each car to be hauled closer to the face and also lessen the distance it is necessary to handle the coal when loading. If roof conditions will permit, the rooms can be driven 40 ft. wide.



SELF-ACTING INCLINE IN A DOUBLE ROOM

When drawing back the pillars, in this system, the pillar should be cut through from each side, at the face, before changing the rope. Then the rope should be carried across the face of the room and made to operate the cars on each side of the pillar, which avoids the gob or waste stored in the center of the room. Where thick pillars are used and there is much gob, the advantages of this track arrangement will be obvious.

I would also suggest the use of thimbles and clips to fasten the rope to the clevis on each end, thus lessening the wear on the rope and breakage of strands and keeping the rope from getting tangled and kinked, besides permitting it to be lengthened easily and quickly, as the room advances. The surplus rope should be neatly coiled and tied and hung on the end of the car, otherwise it may give trouble. Where sufficient rope to work out a room will make too bulky or cumbersome a coil when the room is being started, different lengths of rope can be used, starting with, say 75 or 100 ft.; and when this is run out, either splicing on another piece of about the same length or moving the short piece ahead to a new room and putting on a piece 175 or 200 ft. long, etc.

I would caution "Mine Superintendent" by saying that my experience has been that this system will not work itself, especially at the start, but must be given considerable attention. The men must be thoroughly trained and instructed in its use and then watched to see that they follow instructions, for it has failed in a number of instances when the system has been misused.

On one occasion, for example, I gave instructions and provided material for the installation of this system in some rooms, in a mine under my control. Shortly after, I was advised by the local superintendent that it would not work and, on inquiring the reason, was told that everything was wrong with it and nothing right and it simply would not work. On personal investigation I found that the necessary material was furnished the miners, but no effort at all had been made to instruct them in its use or to see that it was properly used and kept up.

When the car in the room was loaded and the empty car in the neck attached to the rope, the loaded car was turned loose. No attempt being made to brake or sprag the car, it ran down the incline, jumped the track and ditched in the entry. The empty car, on the other end of the rope, at the same time, was dragged at full speed into the prop to which the sheave was attached, car, prop rope and sheave landing crossways about the middle of the room. Moreover, no attempt was made to coil or otherwise care for the surplus rope, and it was tangled, twisted and dragged all over the room. When the cars had been started on their wild career, everybody in the vicinity had to run to keep from being picked up by the rope and carried along. Of course it wouldn't work. But after a little time and patience had been used in instructing, training and watching the men, no further trouble was had with the arrangement, and it has since worked well.

⁂

Mine Discipline Imperative

Letter No. 2—A recent editorial on this subject, *Coal Age*, Oct. 2, p. 552, is full of pertinent matter suggesting much thought. I advise everyone who has missed this article to look up his back number of *Coal Age* and read the same.

My personal opinion is that the definition of the word "discipline," as conceived in the good old days, is undergoing somewhat of a change at the present time. Indeed, my observation convinces me that this is a fact. The reason for this gradual change in the popular idea of discipline may perhaps be ascribed to the development of the safety-first idea and in part to the evolution of that dire word "efficiency."

Safety first is a grand thing, and it is little wonder that so many companies today hold it in high esteem. It is in fact a great incentive to permanence, progress and prosperity in the industrial world. The phrases, "safety first" and "stand out from under" are strangely illuminated expressions and demand strict compliance with the mandates. Surely our ideas of discipline are changing, and there is a reason.

Observe, for instance, that throughout this wide land the attitude of capital as represented by its management toward that necessary giant, Labor, is manifestly one of caution and doubt, combined with a certain respect of the one for the other. To illustrate: When a child gets to the point where he begins to talk back—when parental discipline is met with sullenness and anger instead of remorse and penitence, then indeed it is time for the parent to sit down and carefully consider his methods of dealing with the insubordinate child.

Applying this simile to the industrial world, the time has come for reflection on the methods to be employed in dealing with labor problems. If respect, obedience and confidence are to be retained, something else must be substituted for the peremptory demands, chastisement and force formerly used in maintaining discipline. The employer and employed alike are coming to realize and grasp the spirit exemplified in the saying, "Let us sit down and reason together."

Efficiency! Did you ever hear that inscrutable word before? What a meaning it conveys in the efforts being made today for betterment. But even yet, if the word is merely whispered in their presence, some managers will act in a very strange manner and display a rough, unapproachable exterior. Nevertheless, "Efficiency" is the slogan. No other term can take its place or convey the same meaning. Its transformations are magic.

Both discipline and the disciplinarian have been carefully inspected by this guardian of progress, Efficiency. Motion pictures have been made of the tracklayer at work, and these have been carefully studied with the result that disciplinarians have been gradually transformed into men of another type. Their heads are longer and their necks are not as thick as formerly. They lack nothing in physical courage. Today, however, the disciplinarian admits that he cannot lick the tracklayer if it comes to a mix, and as a consequence they do not mix. Better results are accomplished by other means and methods. Is it strange that costs of production are lower and there are less tension and fewer accidents—less noise and confusion and sweat? In fact, there is better discipline in the mines of today. Look up the meaning of the word in Webster's Unabridged Dictionary.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

Metric Abbreviations—The following are the common abbreviations used in the metric system:

Milligram, mg.; millimeter, mm.; milliliter, ml.
Centigram, cg.; centimeter, cm.; centiliter, cl.
Decigram, dg.; decimeter, dm.; deciliter, dl.
Gram, g.; meter, m.; liter, l.
Kilogram, kg.; kilometer, km.; kiloliter, kl.

Square millimeter, mm^2; cubic millimeter, mm^3.
Square centimeter, cm^2; cubic centimeter, cm^3.
Square decimeter, dm^2; cubic decimeter, dm^3.
Square meter, m^2; cubic meter, m^3.
Square kilometer, km^2;

Compound Units—It is often convenient to express values involving two or more denominations in terms of a single compound unit. The following are examples of such compound units:

Work is expressed as a force (pounds) exerted through a distance (feet) and its unit, therefore, combines both of these denominations, giving foot-pounds (ft.-lb.), or inch-pounds (in.-lb.), as the case may be.

Power is expressed as work performed per unit of time, as foot-pounds per minute (ft.-lb.p.m.), or per second (ft.-lb.p.s.).

In like manner, the speed of rotation is given in revolutions per minute (r.p.m.); or the speed of a train as miles per hour (mi.p.hr.); or the velocity of an air current as cubic feet per minute (cu.ft.p.m.).

It is common to estimate the value of coal lands in tons per acre, or **acre-tons**; or to express the amount of underlying coal in **acre-feet**, which combines in a single unit both the acreage of the seam and the average thickness of the coal in feet.

CONVERSION TABLES

Numerous forms of tables are in use for converting denominations of the United States system into the corresponding denominations of the metric system and vice versa, but the following are believed to best serve the purpose. For the sake of more ready reference, the denominations of weight, length, area, volume and capacity are here given in separate tables, and the values given in the tables are simple multipliers:

AVOIRDUPOIS (METRIC TO U. S.)

		Drams	Ounces	Pounds	Tons
1 milligram	=	0.00056			
1 centigram	=	0.0056			
1 decigram	=	0.0564			
1 gram	=	0.564	0.035	0.0022	
1 decagram	=	5.644	0.353	0.022	
1 hectogram	=	56.438	3.527	0.220	
1 kilogram	=	564.38	35.274	2.205	0.0011
1 myriagram	=			22.046	0.0110
1 quintal	=			220.46	0.1102
1 tonne	=			2204.62	1.1023

When closer determinations are desired the values given in the metric tables should be employed.

The old surveyor's chain (66 ft.) contains 20.1168 meters, and one kilometer (3280.83 ft.) is 49.71 of such chains.

Inquiries of General Interest

An Electrical Transmission

Will you kindly answer the following question: What size of wire will be required to transmit the power necessary to operate three 30-hp. motors located at a distance of 4,000 ft. from the distributing point? These motors are rated at 105 amp., and we have 250 volts direct current at the switchboard. A. N. Young.

Masontown, Penn.

Correspondent has not given sufficient information to enable us to give a wholly satisfactory answer to his question. Assuming, however, that these 30-hp. motors have an efficiency of, say, 90 per cent. and that each motor takes a current of 105 amp. in developing this power, the voltage to be delivered to the motors will be

$$E = \frac{30 \times 746}{0.9 \times 105} = 236\ \mathit{volts}$$

If this is the voltage to be delivered to the motors, there is a permissible line drop of 250 — 236 = 14 volts.

The proposition on this basis is therefore to transmit a current of 3 × 105 = 315 amp. a distance of 4,000 ft., with a line drop of only 14 volts. Allowing for a wire return, the area in circular mils required for this transmission is

$$A = \frac{21.6 \times 4{,}000 \times 315}{14} = 1{,}944{,}000\ \mathit{circ.mils}$$

Since 1 circ.mil is the area of a circle 1 mil in diameter and a mil is one-thousandth of an inch (0.001 in.), the diameter of wire required in this case is

$$d = \sqrt{\frac{1{,}944{,}000}{785{,}400}} = 1.57\ \mathit{in.}$$

This would make a very expensive installation, and we would suggest that the most feasible alternative is to employ a higher switchboard voltage that will permit a greater line drop. By raising the voltage at the switchboard to 275 volts, the permissible line drop would be 275 — 236 = 39 volts. There would then be required

$$A = \frac{21.6 \times 4{,}000 \times 315}{39} = 697{,}850\ \mathit{circ.mils}$$

The diameter of this wire would then be

$$d = \sqrt{\frac{697{,}850}{785{,}400}} = 0.94,\ \mathit{say}\ \tfrac{15}{16}\ \mathit{in.}$$

Owing to the high cost for copper required for this work, it would have been much better to have employed alternating instead of direct current. This would have made it possible to introduce transformers and "step up" the voltage to any desired pressure, for the purpose of transmission. By this means a smaller wire could be used and the copper cost greatly reduced.

It is possible to install at the power house a motor-generator set and change the direct current of the generators into alternating current for transmission. That, however, would not be a commercial proposition. What should be done, in this case, is to discard the present direct-current machines and in their place install alternating machinery capable of generating current at, say 2,300 volts; transmit this current to the point of distribution and there convert the alternating current into direct current by means of a motor-generator set.

Mine Gases Known as "Damps"

At a recent meeting of mining men the question was asked, "Why do the miners refer to mine gases as 'chokedamp,' 'blackdamp,' 'whitedamp,' etc.?" I would like to know if you can answer that question, stating when and how this term came to be used in respect to mine gases.

Landgraff, W. Va. Thomas Norris.

The term "damp" is of Dutch, Danish or low-German origin, corresponding to the German *dampf* and meaning a vapor or fog. The term was applied in the earliest days of mining when the miner first became conscious that mine air contained noxious gases of which he had little or no knowledge.

Later, as the characteristics of the different mine gases became known, the miner designated them according to their observed effects. The general term "stonedamp" was applied more or less generally to all the mine gases, as coming from the rock strata.

Carbon dioxide (CO_2), mixed with more or less nitrogen as the result of the different forms of combustion constantly taking place in the mine, was designated by the terms "blackdamp" or "chokedamp," because of its choking effect, these gases being irrespirable and producing suffocation.

Carbon monoxide (CO) has been generally termed "whitedamp," probably because of its prevalence in low, damp and poorly ventilated places, where a fog or mist is often to be observed in the mine. It is not to be inferred by this that carbon monoxide is visible, but that it received the name of "whitedamp" because of its association with such places, the fog being mistaken by the early miner for this deadly gas.

Marsh gas mixed with air in inflammable or explosive proportions was naturally termed "firedamp," while the deadly gaseous products remaining after an explosion in the mine were termed "afterdamp."

Sulphureted hydrogen (H_2S) received the name of "stinkdamp," because of its nauseating smell, which resembled that of rotten eggs.

These terms will be found fully explained in the chapter on "The Common Mine Gases," in "Mine Gases and Explosions," Beard. Some confusion exists in respect to the correct meaning and application of the two terms "blackdamp" and "firedamp." Blackdamp is often taken to refer to carbon dioxide (CO_2), whereas it was properly and originally applied to the extinctive products of combustion, consisting of a mixture of nitrogen and carbon dioxide. The term "firedamp" originally described an inflammable or explosive mixture of mine gases consisting chiefly of methane (CH_4) and air. The mixture must be such as to inflame or explode in contact with flame.

Examination Questions

West Virginia Examinations, Oct. 26-28, 1915

(*Selected Questions*)

Ques.—In driving entries or rooms that are known to liberate explosive gases, what precautions would be necessary to insure the safety of the workmen?

Ans.—Only safety lamps should be used in this work. A good current of air should be directed well into the face of the entries or made to sweep the faces of the rooms. To do this, it may be necessary to erect lines of brattice extending to within a few feet of the working face. The brattice should be so placed that the intake air will pass up behind the brattice on its way to the face. The safety lamps must be closely watched to observe the first indication of any increase in the amount of gas present in the air. Where gas is coming from the roof, special attention must be given to the timbering in order to prevent undue roof falls, which might liberate a large quantity of gas suddenly. Where the coal is blasted, only permissible powder should be used and moderate charges employed. All shots should be inspected and fired by competent shotfirers, and tests should be made for gas in the place where a shot is to be fired and in the adjoining places before setting the blast.

Ques.—Would you consider it safe to work with open lights in any portion of a mine liberating explosive gases?

Ans.—This question is one of growing importance in coal mining; it is the old question of using mixed lights in a mine generating explosive gases. While many such mines are worked with mixed lights at the present time, the practice cannot be said to be commonly safe. There are many unforeseen conditions that may arise that would render the presence of open lights in any part of the mine exceedingly dangerous. It is well known that the flow of gas from rock strata is not uniform. At times heavy gas feeders are encountered that quickly overcharge the mine air in those sections of the mine where the gas is liberated. Also, the flow of gas is spasmodic. It frequently happens that sections of the mine that have not been troubled with gas for some time suddenly become gaseous. This may be due to a squeeze occurring in the gaseous section, and although the effect may hardly be appreciable in the working of the coal, it would endanger the open-light section.

A heavy fall of roof occurring in the safety-lamp section might cause an outflow of gas from that section onto the roads and into the workings of the open-light section. Any derangement of the circulation, owing to the failure of the ventilator or the setting open of a door, would menace the entire mine. Perhaps the greatest danger in the use of mixed lights is the possibility of a driver or other employee inadvertently carrying an open light into places where gas is being generated. It frequently happens that open lights are permitted on the airways of a mine, while only safety lamps are allowed at the faces of the rooms. This practice is exceedingly dangerous and should never be permitted.

Ques.—What is a safety lamp?

Ans.—As this term is understood in coal mining, a safety lamp is a gauze-protected lamp; that is to say, a lamp provided with a wire-gauze chimney of approved construction and in which all openings for the admission of air to the lamp are covered with wire gauze to prevent the passage of flame from within the lamp to the outside atmosphere.

Ques.—How is a safety lamp constructed, and for what purpose is it used?

Ans.—There are two general classes of safety lamps, designed respectively for testing for gas and for working at the face. The favorite lamp for testing for gas has always been the unbonneted Davy. This lamp consists of an oil vessel surmounted by a wire-gauze chimney about 1½ in. in diameter and from 4 to 4½ in. in height. The standard wire gauze is composed of a mesh of 28 wires to the inch and contains 784 openings per square inch. The gauze chimney is secured firmly to the oil vessel and is surmounted by a gauze cap or "smoke gauze" as it is commonly called, its purpose being to give added protection at the top of the chimney where there is the greatest danger of the lamp passing flame.

The safety lamp designed for work at the face is provided with a glass chimney, which surrounds the flame and is surmounted by a shorter gauze chimney that is generally of a slightly conical shape. The gauze chimney may or may not be provided with a metal shield called a "bonnet." This form of working lamp, known as the Clanny type, is shown in the accompanying figure. The glass chimney affords a better light for the workmen and gives an added protection against strong air currents. The lamp, however, is not as sensitive to gas as the Davy, which has an entire gauze chimney.

BONNETED CLANNY

The purpose of the safety lamp is to permit men to work with safety in an atmosphere containing an inflammable mixture of gas and air in which an open light would be dangerous. When a safety lamp is introduced into a body of gas, the gas-charged air entering the lamp will burn within the chimney, but the flame will be prevented from passing through the gauze by the cool metal. The small streamlets of gas passing outward through the mesh of the gauze become cooled below the point of ignition of the gas, so that the flame is extinguished.

Ques.—When is a safety lamp unsafe?

Ans.—A safety lamp is unsafe when handled by an inexperienced person, or in a careless manner, or when the lamp is exposed for too long a time to an inflammable atmosphere. The gauze of the lamp then becomes sufficiently heated to allow the passage of flame through the mesh of the gauze.

Book Reviews

Electrical Engineers' Handbook

STANDARD HANDBOOK FOR ELECTRICAL ENGINEERS, Prepared by a Staff of Specialists. Frank F. Fowle, Editor-in-Chief. McGraw-Hill Book Co., Inc., 239 West 39th St., New York City. Leather, 4¼x6¾ in. pp. xvi + 1916 + an index of 68 pp. Several illustrations. Fourth Edition. $5, net.

Prof. T. Hudson Beare, of University College, London, believed in the use of textbooks in examinations and used to say that there were two essentials of an engineer's education—to know where to find things and to know how to use them when found. For electrical engineers this handbook removes the first difficulty. The expert must still, as always, overcome the second by his own experience and native ability.

To make the book easy of reference there is not only an excellent index, but also in the covers is a separate general numbered classification of the subjects contained, the numbers being placed in thumbholes on the margin of the book as the letters of the alphabet are disposed on the edge of a dictionary. This makes it easy to refer to any subject.

Thus section No. 1 devotes 151 pp. to "Units, Conversion Factors and Tables." It is written by Arthur E. Kennelly, professor of electrical engineering, Harvard University and Massachusetts Institute of Technology. Section No. 2 is on "Electric and Magnetic Circuits" and is written by Vladimir Karapetoff, professor of electric engineering, Cornell University. Some of the sections have many authors where the information contained in them is of a specialized nature and is not part of the common practice and use of the whole profession. Thus "Miscellaneous Applications of Electricity" has no less than 12 contributing editors.

The "Standardization Rules of the American Institute of Electrical Engineers" forms one section and "General-Engineering Economics and Central-Station Economics" another. In the latter the reader will find much to instruct him as to the many methods of determining the load factor for central-station charges. The purchaser of power from public-service corporations to operate his mines should be well posted as to the nature of such contracts.

The subject of "Coal- and Ore-Handling Machinery" falls to C. D. Gilpin, electrical engineer for the Wellman-Seaver-Morgan Co. Graham Bright, engineer of the mining department, Westinghouse Electric and Manufacturing Co., writes briefly (6½ pp.) on "Coal Mining." There is, of course, but little about the application of electricity to coal transportation and production. It has more, however, than Trautwine or Kent, which are reference books of like character. Yet no mining engineer can afford to be without either of these, and he will do well to provide himself with this book, which perhaps we may name "Fowle," though the editor-in-chief modestly refrains from giving his name such publicity, realizing that he is rather the assembler of the parts than the mechanician who constructed them.

The coal-mine operator will read and refer with interest to the sections on "Direct-Current Generators and Motors," "Alternating-Current Generators and Motors," "Converters and Double-Current Generators," "Power Plants," "Power Transmission," "Distribution Systems" and "Batteries."

The reader who has Trautwine and Kent is apt to fear that in getting an electrical manual he will be purchasing a large amount of material in duplication of what appears in those books, but if he should invest in Fowle he will find he has a book closely confined to its exclusive field, the exception being 110 pages on power plants. There are only eight pages in all given to natural sines and cosines, logarithms and hyperbolic logarithms. Because a few people are ill-equipped with tables in easily portable form every engineering author seems to delight in adding to his book a series of tables which are all very useful in their way, but are useless and "in the way" most of the time. Our eight-foot book shelves of engineering classics might be trimmed over a foot if redundancies such as these were eliminated.

Another unfortunate tendency is to teach in such textbooks mathematics, elementary and advanced, chemistry, mechanics and physics. As a result, such treatises are so extensive in scope that no attempt can be made to make them complete. Mr. Fowle avoids this fault admirably, and the book will stand the closest inspection.

A Directory of Coal Operators and the Supply Trade

THE COAL FIELD DIRECTORY AND MINING CATALOGS OF COAL MINING EQUIPMENT FOR THE YEAR 1915. Second Edition. Keystone Consolidated Publishing Co., Inc., 6th floor, House Building, Pittsburgh, Penn. Cloth boards, 9x12½ in.; 656 pp. illustrated.

This directory of operating companies and of the concerns supplying their wants meets the needs of both parties and has a hearty welcome from the public. It was the intention of the reviewer to refrain from praise this year because last year he stated, "In it [the Coal Field Directory] is added an exceptionally valuable addition of 17 pages, cataloging mines by counties, so that traveling men and managers who wish to district their work will receive no little assistance in so doing."

It seemed a risky matter to applaud anything in the book because what was singled out for express approval last year was for some reason omitted in the present edition. But it appears that in future issues this valuable adjunct will not be omitted. It serves several purposes. Granted that we know the town and county in which an operation is located, it is easily possible in that department of the book to find the names of all the concerns operating in that place and by a process of elimination to ascertain the firm regarding which information is wanted.

It is sometimes necessary to find all the concerns mining coal in a certain field, and even the state mine reports which are almost always based on districts of inspection are far less available than the "Blue Book." So the reviewer trusts this important feature will be restored in 1916. He will undertake not to charm it away by needless praise. Regret must also be expressed that the authors have seen fit to eliminate the list of inspectors formerly printed on the last page of the book. Nowhere else was such a complete list of these public functionaries obtainable.

The book has almost 92 more pages than last year. The catalog material is more complete than ever, and the selection of information in this part of the volume is good. As the matter is of an encyclopedic character it is well-suited for reference. If a beginner were asked where to find information about mining machinery and equipment, he might well be recommended to peruse the directory, so closely does it approximate to a textbook in its manner of presentation; and to complete the resemblance, several pages of nonadvertising free information have been added by the manufacturers. It has been rightly said there are few people who know machinery and equipment better than the man who makes them.

The Coal Field Directory is remarkably complete. Fewer and fewer companies are withholding information. If the company's directing heads and manner of operation are not given, it is almost an infallible sign that its affairs are not worth chronicling. In small, condensed type without unnecessary syllables we find the names of the operating and store company, the president, treasurer, secretary, vice-president, general manager, purchasing agent, general superintendent, mining engineer, mine superintendent, mine foreman, consulting engineer, electrical engineer, master mechanic and store manager, with their addresses. The name of the mine, its freight station or stations, the railroad or railroads reaching the town, the county, the system of hauling and of mining, the number of boilers used, their rating and type, and the number of employees and coke ovens, details as to the pumps installed and the generating units, the voltage of the current, the number of air compressors and the tonnage last year are all given. It is really a remarkable compendium of mining information.

The reviewer trusts that in coming editions this useful book will develop rather than decrease its cross-indexing. When the last stage of completeness is reached, the mining officials will be indexed so that their affiliations may be readily traced. An important man is often better known than his company connection, and it is frequently useful to be able to trace the points where men of lesser importance are to be found. An index of officials which will enable the public to do this will be of much value to mine operators, especially if such a list is accompanied by the addresses of the persons listed so as to form a personal directory.

Coal and Coke News

Harrisburg, Penn.

The recent announcement by Chairman Robert K. Young, of the State Workmen's Insurance Fund, that the rates would be 10 per cent. less than the approved rates in the insurance rate manual and that $5 would be the minimum premium is the beginning of the state's campaign in behalf of the fund for liability insurance.

In connection with this general announcement, the Board issues the following explanatory remarks.

The announcement of this approved rate reduction of 10 per cent. on all rates is a matter of much interest and concerns all employers of labor in the State of Pennsylvania.

The law creating the fund requires that the premium rate shall be fixed at the lowest amount consistent with the maintenance of a solvent fund and the creating of an adequate surplus and reserve. The fund pays no commissions or agents and does not have to earn profits for stockholders, and for the first three and one-half years the entire expenses of the management are paid by the state. The elimination of these expenses is sufficient to allow the board to write insurance at this reduced original rate. The balance remaining which may be applicable on the basis of an average experience also gives every prospect of returning a very substantial rebate in dividends to subscribers at the end of the year so as to bring the cost of the insurance in the state down to a much lower basis.

They may obtain their compensation insurance in the state at a rate lower than that charged by the stock and mutual companies, and also will receive the benefit of aditional advantages which cannot be obtained by other forms of insurance. Employers insuring in the state fund can obtain a complete release of their personal liability and full protection of their property against compensation liens. If the subscriber to the fund makes the report of an accident within 7 days, his liability ceases and is transferred automatically to the fund, so that no valid lien can be filed against the property of an employer insuring in it. Every other form of insurance leaves the employer personally liable, so that every agreement or award of compensation may be entered as a lient against his real estate wherever situated within the state, and this lien cannot be discharged until the whole compensation agreed upon or awarded has been paid in full. In serious cases this compensation will run for a number of years, during which period the lien must remain as a cloud upon the employer's property.

There is also an advantage to subscribers in the state fund that there will be no contingent liability to assessments to which all employers insuring in mutual associations are subject. The purpose of the act was to make the payment of the premium the sole liability to subscribers, and no assessment will be levied in any case, as there is not one word in the act creating the state fund that directly gives or by implication suggests the right of assessment.

The state fund will provide insurance at net cost, and by the elimination of the operating expenses which other companies must pay out of their premiums it is reasonable to assume that the state can furnish complete protection under the new law at a price below that of other insurance.

In the announcement of $5 as the minimum premium the board has solved the problem which has been confronting the small employer with one, two or less than five employees engaged in occupations of a minor hazard. This amount was decided upon as an attractive inducement to the small employer to insure in the state fund, as it was apparent that it would be necessary to issue the insurance for the small employer at a price which would not burden him. The employer will have the same complete protection and release from liability as the regular policy, and it is intended to encourage the acceptance of the workmen's compensation act by the employers whose estimated payroll is of an amount where the individual classifications are not computable at a rate which would exceed the minimum figure. It is probable that this minimum adopted by the state fund is less than the other companies will desire to issue policies to employers who would come within the minimum limits.

Petition for Re-argument

Attorney-General Brown recently, filed a petition in the State Supreme Court asking for a re-argument in the anthracite coal tax case. The Court recently decided that the law of 1913, levying a tax on hard coal was unconstitutional. Eleven reasons are given for another review, among them being that the opinion of the Supreme Court is "contrary to all precedent in Pennsylvania, because it is the first time in the history of the jurisprudence of the state that classification for the purpose of taxation has not been sustained"; and that it "is the first time in the history of Pennsylvania, or elsewhere in the United States, so far as counsel are advised, that where a classification has been sustained for one purpose the same classification has not been sustained for purposes of taxation."

The logic of the opinion of the Court the petition further says, "that there is no reason for taxation, because 40 per cent. of anthracite coal is in competition with bituminous," will lead to a denial of the right to classify coal, oil and other fuel for taxation because it comes into competition with coal.

With regard to the distribution of the tax which the supreme court declared contrary to the constitution, the petition says: "Even if it be true that the provision for partial distribution among counties is unconstitutional that furnishes no reason for striking down the tax. The two matters are so separate and distinct that the tax may be sustained though the distribution provided for be forbidden."

The offer of the Philadelphia & Reading Coal and Iron Co. and other smaller firms to refund to the wholesalers money they collected as state tax on anthracite will be opposed by the state authorities, it is said here.

The filing of the information in escheat with the Auditor-General of the state by an attache of that department prevents any one benefitting from collections of the alleged "unclaimed fund."

In many instances the coal operators sold coal to wholesalers with the exact amount due because of the tax set forth on their bills. These companies will have no trouble in determining what amount should be paid over. The state's interest in the matter will go further, as Auditor-General Powell will compell the wholesalers to show that they have returned the money to their customers.

PENNSYLVANIA

Anthracite

Lansford—A. Carl Neumiller, chief forester for the Lehigh Coal and Navigation Co. is planting one shade tree in front of each dwelling owned by the company in this town.

Sunbury—Coal in the Susquehanna River, between here and Nanticoke, is virtually exhausted for this year. Fifty thousand tons were removed last summer.

Girardville—The McTurk Colliery, operated by the McTurk Coal Mining Co., has resumed operations, giving employment to hundreds of men and boys.

Tamaqua—As the result of a button strike 2,000 miners in the collieries of the Lehigh Coal and Navigation Co. in the Panther Creek Valley were recently thrown out of work.

Summit Hill—At the present time the Lehigh Coal and Navigation Co. has 7 mine locomotives and 3 steam shovels in constant operation in its endeavor to stop the 60-year old fire in the coal deposit of this district. A cut over 200 ft. deep is being made under the lower level and it is the intention to use this opening to drive the fire to the surface with air currents, while extensive sluicing operations are continuing from the top. It is the intention of the company to expend if necessary $1,000,000 in order to quench the fire for all time.

Hazleton—In the course of stripping operations near the Honey Brook No. 1 colliery of the Lehigh & Wilkes-Barre Coal Co. the deposit was found to be on fire. This is believed to be a continuation of a fire which was thought to have been extinguished in 1880. In order to extinguish the fire a pipe line over a half mile in length has been laid, which will carry a slush mixture of ashes, culm and dirt.

Lykens—Old timber in the lower gangway of the Short Mountain Colliery recently caught fire in some unknown manner and was extinguished only after three days and nights of continuous labor. Operations at this colliery have been resumed.

Bituminous

Connellsville—Religious holidays, carefully observed in the coke region by foreign workers, cut down coke production recently in spite of the fact that 400 ovens, which had been idle for a long time, were again placed in operation. The 31,000 active ovens have a weekly capacity of approximately 450,000 tons, if properly speeded up. Merchant operators have 80 per cent. of their ovens in use, while the furnace interests without the recent addition of idle ovens, are operating to 81 per cent. of their capacity.

Central City—A shortage of miners is causing much trouble for the coal operators in this vicinity as well as Cairnbrook. The Lochrie mines are especially hampered because of the shortage of men. The Pennsylvania R.R. is to extend its line from Cairnbrook into the coal fields here. Much activity is expected in these new fields in the spring and it is realized that better shipping facilities will be necessary.

Uniontown—Announcement has been made that J. Blair Kennerly, of Philadelphia, has taken a 15-year lease on the Ansbach coal mining property located on the Whites Creek Branch, about four miles above Confluence, Somerset County. The lease was obtained from the Girard Trust Co., of Philadelphia, trustee for the Fred J. Ansbach estate, with all the improvements on the mine. The lease became effective Nov. 1. Work of mining will begin about Nov. 22 and will give employment to about 75 men. The mine contains a 4.5- to 5-ft. vein of C prime coal and the production is expected to average about 800 tons a day. The tract includes 550 acres. The mine, which has been idle for a year and a half, is self draining and is equipped with electric haulage and coal cutting machinery. Two additional side tracks and a shaker screen are being installed.

WEST VIRGINIA

Bluefield—Every available car of the Virginia & Southwestern, the Carolina, Clinchfield & Ohio, and the Norfolk & Western railways are apparently busy all the time, and an immense tonnage of coal is being moved to market. Many coke ovens throughout the nearby field have been lighted after long periods of idleness.

Huntington—A coal deal of considerable magnitude was recently closed in this city when the Mason Coal and Coke Co. sold a large tract of mineral land to the Cumberland Mountain Coal Co. of Charleston. The exact consideration in this deal has not been named, but it is understood to be in the neighborhood of $100,000. The coal land in question consists of 13,000 acres in Buchanan County, Va., and is tributary to the Norfolk & Western R.R.

Fairmont—The old Pierpont mine is blamed for the sinking of buildings, water lines and sewer pipes in this city. New brick buildings erected within a year have been ruined. A similar occurrence took place some years ago in another part of the town. This has now apparently reached a state of stability, and the buildings then damaged are being rebuilt.

The shaft to the coal in the Carolina mine of the Consolidation Coal Co. has been completed at 500 ft. The shaft at the Idamay mine is also nearing completion, and is expected to be finished at 480 ft. Loading is expected to begin at both of these mines by Jan. 1, and shipments will be made over the Baltimore & Ohio to the Western Maryland.

Dola—Practically all of the coal mines in the vicinity of Dola are running full time; even those which have been closed down for several months have resumed operations and old employees are back at work.

ALABAMA

Birmingham—A contract has been offered the State of Alabama by the Sloss-Sheffield Steel and Iron Co. for the use of state convicts to be worked in the Flat Top mines. This company is giving up the use of county convicts, but wishes to employ between 350 and 400 state convicts in the mining of coal and between 50 and 75 in keeping up the mines, the full number to be between 400 and 500 men.

TENNESSEE

Turley—The Turley Coal Co., R. O. Howard, Atlanta, Ga., president, has been placed in the hands of a receiver. The mine has been closed down and the property is for sale. The Central Bank and Trust Co. of Atlanta, Ga., holder of the first mortgage bonds, is the receiver.

KENTUCKY

Typo—A party of officials of the Louisville & Nashville R.R. recently went over the First Creek branch out from Typo through the First Creek coal field to determine whether to begin hauling coal from the different plants there, most of which are in readiness to begin shipping. Within two weeks shipments will start.

Hazard—The Blue Grass Coal Co. near here makes the announcement that it will be ready to start shipments from its new plant by Nov. 25. Mining work will be started within the next few days.

Barbourville—All the mines in the Cumberland Valley are now working full time and a good proportion of them are working night shifts. A full run through the winter is expected by the trade.

Whitesburg—Small operators of the Big Sandy territory and its tributaries east of here continue to complain of a car shortage and are said, in many instances, to be suffering from lack of cars. From the railroads, however, it is promised that plenty of cars will be supplied in the near future.

OHIO

Columbus—Ohio operators are almost unanimously opposed to reviving the interstate conference agreement in dealing with the wage question when it comes up for settlement after Apr. 1, 1916. The interstate conference agreement consisted of Ohio, Western Pennsylvania, Indiana and Illinois and had been in force for several years previous to the 1914 agreement. An informal meeting was held in Columbus recently when the question of reviving the interstate conference agreement was discussed. Letters were then sent out to oprators asking their views. Almost without exception operators believe that Ohio should treat with the miners' organization single handed.

INDIANA

Linton—Local capitalists interested in the strip mining industry have taken options on several hundred acres near Clark Station, 3 miles south of here.

Terre Haute—Dr. August F. Knoefel, of this city, has been in Washington to ask the bureau of mines to make further investigation into the mining industry of Indiana and to make an increase in government rescue equipment in the state. There is only one mine rescue car in Indiana. It is now in the Linton field.

ILLINOIS

Springfield—President Frank Farrington, of the United Mine Workers of Illinois, has issued a statement that union miners may belong to the state militia and directing that no man is to be expelled from the union because he is a member of the national guard. The announcement is the result of trouble recently at Hillsboro over the suspension of union miners for belonging to the militia.

New Baden—The miners employed at the New Baden Mine of the Southern Coal, Coke and Mining Co., after being on strike for a week, have returned to work on practically the same conditions as prevailed before the strike. The dispute was as to cars of coal that were run through without being weighed. The practice has been, when this occurred, to take the average weight of the cars sent up by the particular miner for the day and make allowance on that basis for the one that was not weighed. The miners objected to this method. After a conference of miners' officials with the company it was promised that a defective condition of the hoppers which prevented the weighing of all cars would be corrected as soon as possible, so that all coal could be weighed.

IOWA

Eldora—A new coal field has been discovered north of Eldora, Ia., and the coal is of sufficient thickness to permit of profitable working, it is said. Drilling has been in progress for several weeks and those in charge say that coal in workable measure underlies considerable territory north of Eldora, although the extent of the field has not been determined.

Des Moines—One of the first aid cars of the bureau of mines will arrive in Des Moines Nov. 21 and remain until Dec. 8. Notices have been posted at all coal mines in Iowa and northern Missouri. J. J. Forbes, in charge, will give first aid instructions. In addition to the miners it is expected factories and wholesale houses will send representatives. As the Des Moines field is large, Mr. Forbes will utilize the lecture rooms of the new Iowa Industrial Hospital in making demonstrations.

WYOMING

Frontier—Mine Rescue Car No. 5 of the United States Bureau of Mines, will be in Frontier from Nov. 14 until Dec. 4. Free lectures will be given to miners on safe methods of mining and the use of safety lamps and rescue apparatus will be explained. Miners will also be trained in rescue and first aid. Moving pictures will be exhibited showing good and bad methods of mining.

FOREIGN NEWS

London, England—Official notice was recently posted in all collieries stating that such a large number of miners have already joined the army that "the supply of coal which is of vital national interest is seriously affected." Coal miners will hereafter be accepted as recruits only on condition that they will continue to work in the mines until called upon. "The miners must one and all remember," the notice continues, "that upon their efforts the success of the country depends, no less than upon the men who are serving with the forces."

PERSONALS

D. P. Cary recently resigned from the presidency of the Lorain Coal & Dock Co. S. W. Braggins, sales manager, will act as president of this firm until a successor is named by the board of directors.

Frank A. Vanderlip has taken a position on the board of directors of the S. K. F. Ball Bearing Co. of Hartford, Conn. This firm has a paid up capital of $2,000,000 and will shortly erect a factory in Hartford.

J. D. Mooney has been appointed sales manager of the Commercial Department of the Hyatt Roller Bearing Co. In the past Mr. Mooney has been in charge of belting sales for the B. F. Goodrich Co., Akron, Ohio.

Harvey H. Morris, assistant superintendent of the Huntington & Big Sandy division of the Chesapeake & Ohio R.R., and one of the veteran officials of the system, recently tendered his resignation in order to become general manager of the West Virginia Standard Coal Co. This company was organized by Mr. Morris, and will have its general offices in Huntington.

William J. Jones, of Akron, N. Y., former mine and quarry inspector for the state and later state inspector of explosives in the State Fire Marshal's Department, has been appointed superintendent for the Berlin Smokeless Coal and Clay Mining Co. This firm will develop several hundred acres of coal and clay land in the vicinity of Macdonaldton, Somerset County, Penn.

W. F. Hyde has been employed by the West Virginia-Pittsburgh Coal Co. as a welfare expert and will devote a portion of his time to the employees of the company at Collier and Wellsburg. Mr. Hyde has been in charge of welfare work at Wheeling for several years, and is known locally and nationally for his community and welfare work. He will also do similar work among the employees of the Richland Coal Co., and the Hitchman Coal and Coke Co., of Wheeling.

OBITUARY

John Kennedy, of Pricedale, Penn., one of the oldest and best known mine foremen with the Pittsburg Coal Co., died recently at his home in Pricedale. Mr. Kennedy was 55 years of age and is survived by his wife, three sons, and three daughters.

RECENT COAL AND COKE PATENTS

Underfeed Furnace. R. S. Riley, Providence, R. I. 1,148,625 Aug. 3, 1915. Filed Oct. 20, 1911. Serial No. 655,822.

Gas Producer. W. O. Amsler, Pittsburgh, Penn. 1,149,611 Aug. 10, 1915. Filed Oct. 3, 1911. Serial No. 652,529.

Mining Machine. C. O. Palmer, Cleveland, Ohio. 1,149,215 Aug. 11, 1915. Filed Mar. 11, 1909. Serial No. 482,750.

Mining Machine. L. F. Hess, Ansted, W. Va. 1,147,724 July 27, 1915. Filed Nov. 21, 1914. Serial No. 873,313.

Coke Conveyor. D. F. Lepley, Connellsville, Penn. 1,142,895, June 15, 1915. Filed Sept. 18, 1914. Serial No. 862,392.

Gas Producer. P. G. Schmidt, Olympia, Wash. 1,142,914, June 15, 1915. Filed Mar. 29, 1913. Serial No. 757,671.

Mechanical Stoker. G. B. Rait, Minneapolis, Minn. 1,149,685 Aug. 10, 1915. Filed Apr. 10, 1914. Serial No. 830,878.

Apparatus for Separating Coal. F. Pardee, Hazleton, Penn. 1,149,463 Aug. 10, 1915. Filed May 2, 1913. Serial No. 765,170.

Pulverized Coal Burner. N. L. Warford, Anaconda, Mont. 1,147,833 July 27, 1915. Filed Dec 5, 1914. Serial No. 875,665.

Gas Producer for Furnaces. W. O. Houston, Bellaire, Ohio. 1,149,056 Aug. 3, 1915. Filed Feb. 9, 1914. Serial No. 817,384.

Mechanical Stoker for Locomotive. E. Young, Pony Lake, Neb. 1,148,735 Aug. 3, 1915. Filed Oct. 25, 1913. Serial No. 797,226.

Mechanical Fuel Feeding Apparatus. I. Stordahl, Miles City, Mont. 1,144,156, June 22, 1915. Filed Feb. 8, 1915. Serial No. 6949.

Fuel Saving Attachment for Furnaces. N. J. Russell, Chicago, Ill. 1,150,456 Aug. 17, 1915. Filed Mar. 12, 1915. Serial No. 14,018.

Mining Machine. H. A. Kuhn and W. W. Macfarren, Pittsburgh, Penn. 1,148,973 Aug. 3, 1915. Filed Jan. 2, 1909. Serial No. 470,292.

Mining Machine. C. E. Davis, assignor to Goodman Mfg. Co., Chicago, Ill. 1,149,502 Aug. 10, 1915. Filed Jan. 13, 1911. Serial No. 602,386.

Mining Machine. L. F. Hess, assignor to Hess Dustless Mining Machine Co. 1,143,599, June 15, 1915. Filed Mar. 26, 1912. Serial No. 686,287.

Mining Machine. F. L. Sessions, assignor to Jeffrey Mfg. Co., Columbus, Ohio. 1,143,144, June 15, 1915. Filed Feb. 16, 1909. Serial No. 478,201.

Automatic Releasing Device for Cars upon Mining Cages. S. Galli, Mulberry, Kan. 1,150,819 Aug. 17, 1915. Filed Jan. 21, 1915. Serial No. 3555.

Boiler Construction. W. F. Sellers, assignor to Edge Moor Iron Co., Edge Moor, Del. 1,148,544 Aug. 3, 1915. Filed Nov. 25, 1914. Serial No. 873,851.

Mine Car Wheel. H. A. Holzer, assignor to United Iron Works, Springfield, Mo. 1,144,302, June 22, 1915. Filed Apr. 5, 1915. Serial No. 19,267.

Boiler Furnace. C. H. Schroder, assignor to Murray Iron Works, Burlington, Iowa. 1,141,127. Aug. 24, 1915. Filed Feb. 3, 1915. Serial No. 5920.

Smoke Prevention Apparatus for Furnaces. W. Williams, Glebe, New South Wales, Aust. 1,148,421 July 27, 1915. Filed Nov. 4, 1913. Serial No. 799,194.

Manufacture of Coal Briquettes. H. J. Phillips, assignor to Pure Coal Briquetters, Ltd., Cardiff, Wales. 1,149,536 Aug. 10, 1915. Filed Jan. 31, 1914. Serial No. 815,688.

INDUSTRIAL NEWS

Philadelphia, Penn.—Lloyd's, England, have posted as missing the steamer "Linda Fell," which left this port on Sept. 29 with a cargo of 2,720 tons of coal for Cienfuegos, Cuba.

Ottawa, Ill.—On and after Nov. 15, 1915, the offices of the St. Paul Coal Co. will be located at 1368 Fullerton Ave., Chicago. The old offices were at 306 Central Life Bldg., Ottawa, Ill.

Harlan, Ky.—The Harlan Coal Mining Co. with mines at Coxton and Kayu has constructed 25 additional miners houses and plans to add more at Coxton, in preparation for more extensive mining operations.

McAlester, Okla.—Faires Coal Mining Co. has been incorporated at Oakland City with a capital of $1,000 for the purpose of coal mining. The directors are H. C. Faries, Onie Faries and William T. Fleener.

New Straitsville, Ohio—The Wm. J. Miller Coal Co. has been incorporated with a capital of $5,000 to mine coal. The incorporators are Wm. J. Miller, Herbert Minshull, George Hite, Harry Leake and Frank Davis.

Philadelphia, Penn.—Bituminous tonnage carried by the Philadelphia & Reading Ry. during September amounted to 1,488,917 tons as compared with 1,347,439 tons last year, and 1,521,727 in August of the present year.

Knoxville, Tenn.—The Southern Ry., which recently completed the coal handling terminals at Charleston, S. C., has had a moving picture film made of the work and is showing the picture in theatres in this section.

Bellaire, Ohio—The Johnson Brothers Coal Co. has been incorporated with a capital of $25,000 to mine coal. The incorporators are J. F. Johnson, J. F. Johnson, Jr., Elizabeth Johnson, Joseph E. Poorman, Bessie Poorman.

Ironton, Ohio—The Ironton Engine Co. has begun the manufacture of a new type of electric mine locomotive, operated by a storage battery, and possessing original features of considerable value, it is understood.

Charleston, W. Va.—J. W. Dawson recently purchased at public auction the plant of the Hughes Creek Coal Co. at Hughestown for $3,000. The estimated value of this property was $25,000. It was sold by James Kay, receiver.

Pittsburgh, Penn.—Youngwood Coal and Coke Co. has been incorporated to drill for oil, gas, clay and other like mineral products. Capital, $150,000. Incorporators, C. W. Fulp, H. S. Sterling, A. W. McCoy, all of Pittsburgh, Penn.

Washington, D. C.—Anthracite coal operators of Pennsylvania have petitioned the Interstate Commerce Commission to reopen the rate case in which they asked for lower rates on coal shipped from the Wyoming region to tidewater for trans-shipment.

Beckley, W. Va.—Prince E. Lilly recently purchased from W. W. Hume, R. D. Roller and G. C. Hedrick, 100 acres of coal land near the junction of Stone Coal and Pine Creeks, about four miles from Odd. It is said that $20,000 was paid for this property.

Pittsburgh, Penn.—The 80th birthday of Andrew Carnegie and the 15th anniversary of the founding of the Carnegie Institute of Technology will be celebrated by appropriate exercises at the Institute on Nov. 23 and 24, 1915. An address will be delivered by Henry F. Pritchett.

Whitesburg, Ky.—The Funk Coal Co. organized by H. H. Funk and others is opening a coal development on the Chesapeake & Ohio's Big Sandy extension near Pikeville. This will have a daily capacity of about 1,000 tons to start with. The company will ship from Ward Siding.

Ashland, Ky.—Thomas Adams, president of the Norton Iron Works, is understood to have bought a 28-acre site on which to build a coke and coal by-product plant, to reach a cost of $200,000, to supply coke to the iron works. The plans of the concern, however, are declared to be indefinite.

Camden, N. J.—Three new steamers of about 5,500 tons gross register are about completed at the plant of the New York Shipbuilding Co., which vessels it is understood will be put into the Virginia coal trade as soon as finished. These boats are the "Jonancy," "Virginia" and "Bylayl."

Richmond, Mo.—The Hubbell-Hamilton Coal Co., of Richmond, Ray County, has been organized with a capital stock of $2,400. The incorporators are Clarence H. Hubbell, Robert L. Hamilton, and George W. Hunt. The organization is for the purpose of owning, operating and developing coal mines in Ray County.

Harlan, Ky.—The Creech Coal Co., recently organized in Bell County with $200,000 capital, will develop a mine on the headwaters of Wallins Creek in Harlan County with two openings and proseses a 40-ton daily output at the outset. Work has already been started and a number of miner's houses have been built.

Knoxville, Tenn.—An informal meeting of the Southern Appalachian Coal Operators' Association was held in this city on Saturday, Nov. 13, at which the market situation was considered at considerable length. A good deal of consideration, it is stated, was given to the possibilities of export of coal from the Tennessee-Kentucky field via Charleston, S. C.

Praise, Ky.—D. D. Cox, of Castlewood, Va., has been elected president of the Superior Coal Co., which recently incorporated and which will develop a 300 acre boundary. The capital stock is $50,000 and the other officers are C. W. Boyd, Richlands, Va., vice-president; Frank G. Craig, secretary-treasurer and S. R. Johnson, of Praise, is constructing engineer.

Washington, D. C.—Tariffs of the Southern Ry increasing coal rates from mines at Belleville and other Illinois towns to Kansas City and points on the Chicago & Alton R.R. in Missouri were suspended recently by the Interstate Commerce Commission until Mar. 14. The present rate from Belleville to Kansas City is $1.90 per ton, and the proposed rate is $2.15.

Middlesboro, Ky.—Two and a half miles of the Wallins Creek extension of the Louisville & Nashville R.R. is completed and the contractor has the remaining three miles partly graded. Forty teams are at work and the early part of January is expected to see the branch in operation. This extension opens a large area of some of the best coal land in Harlan county.

Buffalo, N. Y.—The barge "P. D. Armour," owned and sailed by Capt. Joseph A. Boland, of this city, went on the peninsula at Erie, Penn., on the night of Nov. 12 with a cargo of 2,200 tons of bituminous coal, loaded at Ashtabula, Ohio, for Welland, Ont. Both vessel and cargo will be lost. The crew of the barge and of the tug towing it were saved with difficulty, as a gale was blowing.

Bluefield, W. Va.—The Clinchfield Navigation Co. is about to put a new steamer into commission. This vessel was recently completed at a shipyard on the Great Lakes and is now on its way to the Atlantic where it will be used in the coastwise trade, chiefly between Charleston, S. C., and gulf ports. The new vessel, which has not yet been named, has a cargo capacity of about 3,000 tons.

Scranton, Penn.—As the result of complaints entered by the city of Scranton claiming the local rates of freight on anthracite coal from the mines to the cities and towns hereabouts were excessive, the Public Service Commission has ordered a reduction. In some cases the change amounts to as much as 49% and on an average amounts to 27%. The new rates are to become effective Dec. 11.

Whitesburg, Ky.—A party of Pennsylvania and other Eastern capitalists is making a tour of the Shelby Creek-Long Fork and Beefhide sections of the Letcher-Pike border east of here with the purpose of leasing for development a large boundary of coal lands lying along the new line of the Baltimore & Ohio R.R. It is stated that things will be in readiness to start the development work by the first of the new year.

Baltimore, Md.—For years the anthracite tonnage of the Baltimore & Ohio R.R. to this city has been growing less and less owing to poor coal yard facilities on the company's tracks here. To overcome this difficulty the company recently erected several large and up-to-date coal pockets on Huntingdon Avenue, which have now been occupied by dealers. It is the intention of the Baltimore & Ohio to erect additional retail yards on its tracks and lease them to dealers.

Whitesburg, Ky.—It is stated here that preparations are being made by the Chesapeake & Ohio R.R. Co. to build a 15-mi. branch up the right fork of Beaver Creek, on the Knott-Floyd county line. The rights-of-way for construction of the branch were obtained some time ago it is said. A number of firms, including the Elkhorn Mining Corporation, hold mineral rights in that section and are said to plan large operations. This is one of the richest undeveloped fields in Eastern Kentucky.

Pottsville, Penn.—According to information given out by President W. J. Richards, of the Philadelphia & Reading Coal and Iron Co., that firm is already prepared to refund to its customers the state tax collected by the company under the act of 1913. This, it is stated, will be done immediately upon being assured by the legal department that the state will make no further effort to collect the tax. In the event of this failing the money will then be turned back to the purchasers of the coal.

Birmingham, Ala.—The Tennessee Coal, Iron and Railroad Co. is preparing to open two new mines on the Woodstock coal bed near Blocton, Ala., about 40 miles south of Birmingham. These mines will replace those in the Thompson seam on the same division, which are being rapidly exhausted, and are now decreasing in output. Some of the equipment at the present mine will be reused at the new operation, mining machines being added, none being at present in use in the old mines on this division.

Monongahela, Penn.—The best coal shipments for any one month since October, 1913, were reported for October of the current year by Lockmaster George W. Paxton at Lock No. 4. The shipments during October of this year totaled 19,819,000 bu. In October, 1913, 19,933,000 bu. were locked through. All shipments at Lock No. 4 are now being made through the newly-built lock, while the rebuilding of the inner lock is in progress. The government forces engaged on this construction are sadly in need of additional workmen.

Great Falls, Mont.—Pearce Coal Co. has been incorporated here with a capital of $50,000. The articles of incorporation state that the object of the company is to purchase, lease, or otherwise acquire coal lands, and open and operate mines, as well as to engage in the kindred activities that accompany such labors. The headquarters of the company will be at Sand Coulee, Mont. Of the stock, $27,500 has been subscribed by John N. Pearce, of Sand Coulee, Charles Lochray, of Great Falls and Dominic Spogen, of Belt, who incorporated the company.

Blackfield, Penn.—A number of improvements are to be made by the Sonman Coal Co. The output of the plant will be almost doubled by the change. An inclined plane will be used in disposing of the rock taken from the shaft and this will enable the company to greatly increase its capacity for mining coal. A new office building is also being erected.

Black Brothers Coal Company operating here is soon to open another mine and to make improvements at its new plant. This will bring about the hiring of about 100 more miners.

State College, Penn.—In the presence of Governor Brumbaugh, the new mining engineering building of Pennsylvania State College was recently dedicated. The address of dedication was delivered by H. M. Chance, of Philadelphia. The building is three stories in height and contains a valuable collection of working mine models on the third floor, with larger exhibits on the first floor. The remainder of the space is devoted to class-rooms. On the day of dedication the students gave an exhibition of mine rescue work. The entire cost of the building was $50,000.

Coal Trade Reviews

General Review

Anthracite trade satisfactory but less active than anticipated. Reactionary tendency in bituminous though prices are steady. Decline in exports continues. Uncertainties in the Lake markets. Colder weather stimulates buying in the Middle West.

Anthracite—The hard-coal trade is backing and filling pending the arrival of lower temperatures. The situation is generally satisfactory, but there is no pressure for shipments such as is to be anticipated at this period. A few sizes are in short supply, but occasional concessions are noted on other grades where forced sales are made. The general tendency among retailers to file orders well in advance has done much to relieve a reactionary tendency in the market. Possibility of labor troubles in the early spring is also tending to shake out numerous protective orders. Collections are excellent, dealers becoming anxious about their credit position with the large companies whom they will look to for protection in the event of any serious scarcity after Apr. 1. Lake shipments are on a larger scale despite increased freight rates, the arrivals for the season to date at the upper Lake ports being 75,000 tons ahead of last year.

Bituminous—Uncertainties have developed in the market which have caused a moderate reaction, and prices are a trifle weaker. There have been no important revisions, however, and it is not thought by any means that the top of the market has yet been reached. Some agencies tied up with low-priced contracts have been forced into the open market to meet their obligations because of the slow movement. Liberal shipments on contracts continue, consumers evidently endeavoring to keep full stocks as long as possible. The car supply situation continues more alarming each week. It is obvious that the heavy movement of all kinds of traffic is creating a pronounced congestion, which shows every indication of becoming more serious as the season advances.

Exports—The only favorable aspect of the off-shore business is the bunkering trade, which continues fairly heavy. The constantly increasing ocean freights have brought the foreign business practically to a standstill. Some attractive inquiries are still being received, though these are perhaps less numerous as it is becoming clear that the more advantageous terms obtainable in Great Britain, both as regards initial cost and transportation, are beginning to tell. The higher ocean freights are spreading to the coastwise trade where some premiums have been noted during the past week.

Lake Market—While the approaching end of the shipping season is always the cause of apprehension, there are other constructive factors in the market that make the situation rather mixed. Cars are growing steadily scarcer, labor is none too plentiful and there is a strong possibility of a sharp rush for surplus coal at any time to provide for a possible suspension in April. Bituminous shipments to the upper Lake ports for the season to the first of the current month are one and three-quarter million tons behind last year, although this is due primarily to the heavy stocks carried over from the previous season. A lull has developed in the domestic trade, but there has been a still further expansion in the manufacturing which has had a tendency to stiffen up prices on steam coal.

Middle West—The recent lower temperature has had a beneficial effect on the market which was beginning to show some soft spots, and accumulations have been substantially reduced. Operators are holding rigidly to their policy of curtailing productions rather than attempt to force the market, and in view of the existing car and labor shortages, together with the comparatively small stocks on hand, the technical position of the market is strong. The mild weather has tended to curtail the movement out from the upper Lake ports. As a rule industrial operations throughout the Middle West are close to full capacity and it is seldom that much difficulty is experienced in finding prompt disposition of any shipments.

A Year Ago—Anthracite shippers are aggressively canvassing for orders but the recent cold snap has steadied up the market. Tidewater bituminous stocks continue at a maximum, and substantial concessions are obtainable.

BUSINESS OPINIONS

The Iron Age—With new orders steadily running far in excess of current output, it was not surprising that the United States Steel Corporation withdrew quotations in foreign markets last week. This action does not in itself mean a long withdrawal from the export trade, for similar steps are taken at intervals in the domestic market. The fact is that the steel companies have the greater part of their output sold for four or five months, some for most of the first half of 1916, and that in certain lines the market on forward deliveries has been sold to a standstill. Conservative men in the trade who thought two months ago to hold demand in check by asking sharp advances have given up effort on that line. The past week has shown unmistakable signs of a steel market that has cut loose. Pig iron, with somewhat less reason, is following the course of steel.

Boston News Bureau—The continued betterment in fundamental conditions begins to impress itself upon people generally. Every day sees some industry that has been a laggard wheel into the procession. This is a stimulus that makes for confidence and incites broader operations. There is a rising market in all products—in steel, in copper, in lead, in zinc and even in oil. Railroads are moving more traffic and both gross and net earnings are increasing appreciably. Notwithstanding all this, money is still redundant. We are beginning to see the value of the federal reserve system. The power to expand is very real.

Dun—In spite of the rapidity of the movement, there is no slackening of the advance that foreshadows the greatest commercial development in the history of the country. Following many months of gradual recovery and adjustment to new conditions, progress has come with such a rush that reaction is feared in some quarters; yet the economic position steadily gains in strength and seldom, if ever, has the situation so favored continued expansion.

Building Statistics—Permits granted last month, according to returns received by "Dun's Review," from the Building Departments of 86 of the leading cities in the United States, call for the expenditure of $59,622,149, an increase of 23.7%, as compared with the $48,058,062 reported for the corresponding period a year ago.

Dry Goods Economist—The recovery in the cotton market, bringing the New York price for spot cotton to 11.75c., was hardly needed to add strength to the price of finished cotton fabrics. In these goods labor and the cost of finishing are important factors. To sellers of gray goods, however, the advance is welcome.

Bradstreet—Mild weather and delay in crop marketing tend to retard retail buying of heavy seasonable goods as distinguished from edibles, but over against this is to be noted increased demands on jobbers, wholesale dealers and manufacturers, which point to a veritable trade ground swell, such as was witnessed in years like 1912, just before the Balkan war began, and in the flush times of 1906. The fact seems to be that in general trade, as in iron and steel and kindred lines, domestic demand had lagged behind and stocks in final distributers' hands were depleted, causing recent eager buying, which has resulted in a mass of orders.

Southern Lumberman—Price advances in the yellow pine market during the past week have been so rapid and so repeatedly made that the problem of ascertaining prevailing prices is rendered unusually difficult. Speculation is now a factor in buying, and despite increased production there is no sign of weakening anywhere along the line. In fact, advances ranging from fifty cents to a dollar have occurred practically throughout the list, and as increases are being announced almost daily by many of the mills, still higher values may be expected during the coming week.

Marshall Field & Co.—Current wholesale distribution of dry goods has been in excess of the corresponding period of a year ago. Road sales for both immediate and future shipment have been in much larger volume, and more customers have been in the market. Collections are normal.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River easy with prices unchanged. Low on-car prices for 1916 extend to points accessible to lighter. Georges Creek shippers conservative on futures. Pennsylvania grades less active. Water freights continue to advance. Anthracite trade good.

Bituminous—With a liberal movement on contract from Hampton Roads the situation of Pocahontas and New River continues fairly easy. There is ample coal on cars and very little spot inquiry, so there is practically no change in prices f.o.b. Meanwhile, consumers in this territory are trying to keep storage full in anticipation of slow movement later. The high winds along the coast have interfered materially with the movement of tows and several of the shippers are behind on deliveries. If there develops a widespread shortage of cars for all-rail shipments it is likely that an extra demand will be thrown on the Tidewater trade, but this is not looked for under a month's time, if it comes at all. Developments seem to be slow so far as concerns firmer prices on Pocahontas and New River.

The canvass for contracts inland continues, but somewhat less actively, probably on account of the rapid advance in water freights. As low as $3.35, however, has been named on cars Mystic Wharf, Boston, for the year beginning Apr. 1, 1916, and a similar basis has lately been extended to cover deliveries to dealers and consumers' wharves that can be reached by lighter from the various terminal handling plants. A large volume of business has been closed, but for the most part in usual channels.

Georges Creek shippers are filling requisitions with reasonable despatch, but new business is being consistently declined. This is true especially of deliveries all-rail, a car shortage being somewhat in evidence in the Maryland districts.

The better grades from Pennsylvania continue in active demand, due in part to increased quotas required by consumers on contract, but chiefly to difficulties with mineworkers, particularly in the non-union districts. Some shippers are declining new business until the outlook is clearer. The car movement all-rail is easier than a week ago.

Water Freights have advanced another 10c., $1.10 having been paid on a 5,000-ton schooner, Hampton Roads to Portland. As high as $1.50 is rumored to have been paid on a small barge to Bangor, Me., but the premium in this case is due to the approach of river closing. The rate from Norfolk to Long Island sound ports is still 50 cents.

Anthracite continues in good demand, but it cannot be said there is any great pressure for shipments. In spite of the slow movement of transportation the shipping companies are able so far to keep up with their orders. There is some inclination on the part of retailers to file orders well in advance of needs which helps to discount any "pinch" within the next month or two.

Bituminous quotations, f.o.b. loading ports at points designated, are about as follows per gross ton:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields	$2.25@2.75	$2.55@3.00	....	$0.95@1.50
Cambrias and Somersets	2.45@2.95	2.70@3.20	....	1.20@1.65
Georges Creek	2.92@3.02	3.22@3.32	$2.85@2.95	1.67@1.77

Pocahontas and New River prices, on cars Boston, are $3.45 @3.73. Providence, $3.45@3.63; and f.o.b. loading ports at Hampton Roads, $2.80@2.85.

NEW YORK

Anthracite situation satisfactory. Demand steady and all prepared coals tighter. Line trade heavy. Fair movement in soft coals. Good grades scarce and none to be had in open market. Mine prices stiffer.

Anthracite—The hard coal situation continues satisfactory. There is a steady demand which keeps everybody busy and there has been a slight delay in loading some grades unless a mixed cargo is taken. Wholesale houses are paying more attention to the approaching end of the labor agreement than a few weeks ago and there is more hesitancy in the closing of contracts for the delivery of steam coals after the new year. The lack of cars is becoming more serious with the approach of winter.

Egg coal is not as plentiful, but occasional lots are picked up at 10 cents below the circular. Stove is the shortest of the domestic grades and is going at full price, while chestnut is in the same class as egg. The line trade complains of its inability to secure all the chestnut coal desired but much of this delay is due to the scarcity of the kind of cars desired.

Steam coals are coming into their own. Pea is in fair demand and is commanding nearly full price in all instances. High grades of buckwheat No. 1 have been quoted at $2.70 f.o.b. lower port, but this was the exception. The cheaper grades are quoted at around $2.40. Buckwheat No. 2 is short in all grades and there are reports of 10c. premiums for quick deliveries.

Quotations per gross ton, f.o.b. Tidewater, are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$5.20@5.30	5.35	$5.25@5.35
Stove	5.30	5.25@5.30	5.35	5.30@5.35
Chestnut	5.55	5.40@5.55	5.60	5.50@5.60
Pea	3.50	3.25@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.25@2.75	2.80	2.25@2.80
Rice	2.25	1.85@2.25	2.30	2.00@2.30
Barley	1.75	1.50@1.75	1.80	1.75@1.80

Bituminous—There is a good movement, but there has been a slight easing up. The supply at Tidewater is not large, considerable coal being rushed to the Lakes and Western points. While much coal is on its way here, good grades are scarce and fair coals are easily disposed of at good prices.

Car supply shows no improvement, while the freight congestion on nearly all roads centering here is tying up much of the available rolling stock. Some mines are reported as receiving from 50 to 60% of their usual quota of cars. Many large steam users are inquiring for more coal than their contracts call for and are picking up the choicest of the cheaper grades. Mine prices are stronger, some of the poorer coals being quoted at $1.25.

Increasing freight rates are interfering with the export situation. The trade heard last week of a foreign gas corporation in the market for 20,000 tons of coal, but refused to pay the freight rate demanded. Inquiries are also being received from Brazil. Bunkering remains heavy.

Current quotations on various grades per gross ton, f.o.b. Tidewater, are about as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85
Georges Creek Tyson	2.95@3.00	2.95@3.00	2.95@3.00	1.40@1.45
Clearfield:				
Medium	2.80@2.85	2.80@2.85	....	1.25@1.35
Ordinary	2.75@2.80	2.75@2.80	....	1.20@1.25
Broad Top Mountain				1.25@1.45
Cambria County:				
South Forks	3.05@3.10	....	....	1.50@1.60
Nanty Glo	2.90@3.00	....	....	1.35@1.45
Barnesboro	2.85@2.90	....	....	1.30@1.35
Somerset County:				
Quemahoning	....	2.90@3.00	2.90@3.00	1.35@1.45

PHILADELPHIA

Anthracite checked by mild weather but prices strong. Prepared sizes in generally good demand. Buckwheat also active but ordinary grades of rice are going heavily to storage. Collections good. Bituminous orders, hard to fill because of car shortage.

Anthracite—Too much mild weather has had an adverse effect on the market and delayed the expected rush. Shippers and the dealers are chafing at the postponement, since the time lost represents coal that will never be burned. However, the market has moved along quietly and all sizes are in very fair demand, but not sufficiently to cause a scarcity. There have been a few instances of coal standing at scales without orders, that was sacrificed, but on the whole good grades are bringing the full circular.

Pea coal is being stocked, but not in the quantities expected. It is a good buy at $2 and the tax, the price at which the companies have protected the best trade until Jan. 1. Next month the demand for this grade will probably be unusual.

Broken is all sold and the demand is increasing. Egg is none too strong and just now is probably the weakest size. Stove is one of the best sellers, if not the very best. Chestnut is doing very well and much better than for some time. Buckwheat is growing stronger, with special grades in very active demand. Only certain grades of rice are selling, this size still being largely sent to storage by the companies.

Another noticeable feature of the market recently is the amount of new business coming to the larger companies from firms who have not bought for several years. This indicates that these dealers are looking to the future in case of trouble in the regions. Collections are good and there is hardly likely to be any trouble in this direction for a long time to come, as the dealers all realize their cases would be hopeless with coal scarce and their accounts in bad shape.

Prices per gross ton at the mines and for tide shipments f.o.b. Port Richmond are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.50	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—At this writing it is very much a broker's market; that is, on account of many shippers being tied up on low-price contracts and their inability to get full shipments from their operations, they are compelled to buy in the open market to meet their obligations. In several instances purchases of coal were made on this account at 40c. above the contract price. Under such conditions mine owners are not willing to consider any new contract business at current prices. While there has been no particular price change in the past two weeks, it is felt that the top of the market has not been reached.

Export shipments seems to be dwindling and even the foreign inquiries, which up to this time have been very plentiful, are falling off. Large shipments are now being made from the British Isles at prices, both as to coal and freight, which now place the American market at a decided disadvantage.

The ruling prices per gross ton at the mines are well represented by the following list:

Georges Creek Big Vein	$1.70@1.80	Fairmont gas, ¾	$1.35@1.45
South Fork Miller Vein	1.55@1.65	Fairmont gas, mine-run	1.20@1.25
Clearfield (ordinary)	1.20@1.30	Fairmont gas, slack	.90@1.00
Somerset (ordinary)	1.20@1.25	Fairmont lump, ordinary	1.15@1.20
West Va. Freeport	1.05@1.15	Fairmont mine-run	1.00@1.10
		Fairmont slack	.90@1.00

BALTIMORE

Uncertainties in the trade cause a moderate reaction. Car supply becomes shorter. Exports declining heavily as a result of high freights.

The coal trade here is being squeezed every few days by lack of cars in important mining districts, and then again by scarcity of boats at Tide when fuel is rushed through on export account. These uncertainties have made the market a trifle weaker as to prices, although the best coals for the most part are out of the market. Despite the fact that coal men have offered as high as $18 on movement to the west coast of Italy, where there is a heavy demand, the export movement from this port has suffered a heavy slump. During the week ending Nov. 13 only 12,668 tons was loaded here for foreign ports.

The car supply in most of the mining districts of Maryland, West Virginia and Pennsylvania the past week has not averaged much more than 60%. Demand for coal has eased off a bit, however. Prices in gross tons to the trade are about as follows:

	Mines	Balt.*	Fairmont	Mines	Balt.*
Geo. Crk. Big Vein	$1.80	$2.98	Ordinary mine run	$0.95	$2.33
Geo. Crk. Tyson	1.50	2.68	Ordinary ¾	1.00@1.05	2.43@2.48
Clearfield	1.30	2.48	Ordinary slack	.95	2.38
South Fork	1.45	2.63	Low sulphur mine-run	1.20	2.63
Latrobe	1.10	2.18	Low sulphur ¾	1.30	2.73
Somerset (best)	1.40	2.58	Low sulphur slack	1.00	2.43
Somerset (good)	1.25	2.43			
Quemahoning	1.35	2.53			
Freeport	1.10	2.18			
Miller Vein	1.30	2.38			

* F. o. b., outside Capes.

Anthracite dealers here are busy. Colder weather has awakened the domestic consumers, and they are clamoring for coal. Supplies are pretty free, although all dealers are not able to fill gaps as made in their yards.

HAMPTON ROADS

Foreign and coastwise dumpings show some improvement. Government takes some coal by colliers and bunkers several vessels from barges.

The dumpings for the second week of November have shown some improvement over those for the first week, although this improvement has not been large. One of the most interesting shipments of the week was that to Barcelona, by the schooner "Edward J. Lawrence;" this cargo consisted of 4,967 tons and the freight rate was $10.50 per ton. In addition to coal loaded into colliers the government has also taken some by barge for bunkering several of the ships now in Hampton Roads.

The accumulation of coal on the railroad yards is still somewhat above normal, but there is a fair amount of vessel tonnage in port and with that about due this accumulation should be considerably reduced early in the coming week.

There has been practically no change in prices on the various grades of coal shipped from this port. Some few sales have been made during the week, but so far as can be ascertained the greater part of the coal moving has been applied on contract business.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

	Week Ending				
Railroad	Oct. 16	Oct. 23	Oct. 30	Nov. 6	Nov. 13
Norfolk & Western	145,236	163,920	126,145	120,590	133,329

OCEAN FREIGHTS

The freight market continues to advance. The last charters for coals, to Lower Plate ports, were at $10.80, 500 tons per day discharge and steamers are difficult to obtain even on these terms. Shippers of Mediterranean coal are not willing to pay rates owners ask, consequently no chartering is being effected for the movement of coal in this direction. The tonnage scarcity is making it difficult to operate on West Indian orders. We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana	$2.75@3.00	Bermuda	$3.50
Cardenas or Sagua	3.00@3.25	Vera Cruz	5.00@ 6.00
Cienfuegos	3.00@3.50	Tampico	5.00@ 6.00
Port au Spain, Trinidad	4.00@4.25	Rio	10.80
St. Lucia	3.75@4.25	Santos*	11.04@11.52
St. Thomas	3.50@3.75	Montevideo	10.80
Barbados	4.00@4.25	Buenos Aires or La Plata†	10.80
Kingston	3.25@3.75	Rosario	12.00
Curacao	3.75	West Coast of Italy	16.80@18.00
Santiago	3.50	Barcelona**	15.60@18.00
Guantanamo	3.50	Valparaiso or Callao	11.00@12.00
Demerara	6.00@6.50	Marseilles	15.60@18.00

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Market presents mixed showing, but prompt slack is higher. Operations at 75%. More car shortages.

The trade as a whole has shown little if any improvement, though there is a decidedly stronger market in slack and somewhat more domestic coal is moving. There are divergences of opinion about the future. The end of the Lake season, now near at hand, is always feared, but on the other hand there are unusual prospects for consumers desiring to stock coal against a possible suspension of mining Apr. 1, and this, with the steadily growing scarcity of cars, helps to give the market at the moment a better appearance than it otherwise would have.

The scarcity of slack in proportion to the demand is now pronounced, and the market is quotable at 10c. higher than a week ago, being now almost up to the contract level.

Labor is in only fair supply, while car shortages are daily growing more important. Not much production is being lost, in the aggregate, but the market is held steadier than would otherwise be the case. Operations in the district are at about 75% of capacity.

We quote free coal as follows, slack being higher than last week: Slack, 85@90c.; mine-run, \$1.15@1.20; ¾-in., \$1.25@1.35; 1¼-in., \$1.35@1.45, per net ton at mine, Pittsburgh district. On contract we quote: Slack, 90c@\$1; nut, \$1@1.10; mine-run, \$1.15@1.25; ¾-in., \$1.20@1.30; 1¼-in., \$1.30@1.40.

BUFFALO

Perplexing difference between this market and most others. Bituminous mines are unable to obtain specified prices. Anthracite slowing down on account of fine weather.

Bituminous—There is a good local demand, but that is about the best feature. This market is decidedly slower than most others. Pittsburgh is setting prices 15c. higher than can be obtained here, especially in Canada and eastward. There is the same difference between us and the Seaboard district from New York southward. Buffalo operators who are able to get into the Seaboard market have more orders than they can fill.

The Allegheny Valley mines cannot reach the Seaboard and they find trade very dull. Some jobbers complain that prices quoted here are too high.

Prices made by the Pittsburgh shippers, which are not always obtainable here, are as follows:

	Pittsburgh	Allegheny Valley	Penn Smokeless
Lump	\$2.80	\$2.50	\$2.55
Three-quarter	2.65	2.30	.....
Mine run	2.55	2.20	2.30
Slack	2.15	1.90	2.30

Anthracite—The weather is too warm for the best results in the local trade and the demand is not as good as it was a week ago. Consumers often get the idea that mild weather is going to prevail for some time and buying is put off. The line rail trade continues good and the Lake shippers are sending out cargoes whenever there is room for them on the Upper Lake docks, regardless of actual sales. As a rule the smaller Lake ports have laid in their supply for the winter. Lake Michigan rates are up. Vessels are refusing 50c. to leading ports and will seldom take 75c. to side ports.

The anthracite mines are running at a much higher rate than through the early fall. The growing scarcity of men has made the operators anxious to get as large a start as possible. The general anthracite circular remains at \$5.60 for grate, \$5.85 for egg and stove, \$6.10 for chestnut, \$4.30 for pea, \$3.25 for buckwheat, \$2.75 for rice and \$2.50 for barley, all quotations per long ton, f.o.b. Buffalo, with 25c. additional for delivering on board vessels. Lake shipments for the week were 100,800 tons.

COLUMBUS

Increase in demand for steam sizes. Domestic business quiet, owing to the continued warm weather. Price list well maintained. Car shortage increasing.

With car shortage increasing and a continued expansion in manufacturing, the steam trade is becoming firmer in every locality; this is the best feature of the trade by far, as the warm weather has caused a lull in the domestic business. The tone of the market remains good and prospects for the future are brighter. Coal men are of the opinion that there will be a good demand for the fall and winter season.

Prices are well maintained. Retail trade is good, although deliveries are not as rushed as formerly. Householders are still placing orders for the winter's supply. Pocahontas and splints are in good demand and frequent calls are received for Hocking.

The Lake trade continues active. Boats are now chartered with difficulty because of the demand for bottoms in other lines of trade. Congestion on the docks of the Northwest is gradually passing away.

Railroads are still stocking some tonnage, but the heaviest of the stocking movement is past. Iron and steel factories are buying in larger quantities. The market for small sizes continues strong, as there is a dearth of supply, due to curtailed production of the domestic grades. The anthracite market is growing stronger as the winter approaches. Retail prices are well maintained. There is also an increasing demand for coke in the central Ohio territory.

Prices in Ohio fields are as follows per short ton, f.o.b. mines:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	\$1.60	\$1.65	.....	.....
Inch and a quarter	1.50	1.50	\$1.35	\$1.50
Three-quarter-inch	1.35	1.40	.....	1.35
Nut	1.25	1.30	.....	1.25
Mine-run	1.15	1.20	1.05	1.10
Nut, pea and slack	.65	.70	.60	.60
Coarse slack	.55	.60	.50	.50

Mines have been working at about the following percentages of full capacity:

	Week Ended					Week Ended			
District	Oct. 23	Oct. 30	Nov. 6	Nov. 13	District	Oct. 23	Oct. 30	Nov. 6	Nov. 13
Hocking	60	65	60	65	Cambridge	60	65	70	50
Jackson	60	50	45	70	Massillon	45	70	70	40
Pomeroy	65	90	85	70	Eastern O.	85	80	80	85
Crooksville	85	65	65	75		—	—	—	—
					Average	65	69	67	67

CLEVELAND

Steam prices firmer and supplies short. A rushing retail trade marked the opening of the week.

Retail dealers had a rush of orders Monday morning that kept every wagon busy. The dealers are also experiencing some difficulty in getting coal from the operators. The rush is confined almost entirely to Ohio coals.

The receipts of steam coal were light over Sunday, something less than 300 cars having come in. The prices were decidedly firmer and by the end of the week there will be a decided shortage due to the inadequate car supply. As this market is as fickle as the weather a few extra cars would result in a weak market. Fine coal sold up five cents over the preceding week. Good slack brought \$1.75 on track here to jobbers and \$1.80 to the consumers.

The Lake trade is satisfactory. The shipments to the Lake will practically end this week and except to the smaller Lake Michigan ports, few cargoes at a premium are expected. There will be no rush to put extra stocks afloat this year because upper Lake docks are overstocked as it is.

Jobbers are paying the following prices f.o.b. Cleveland per short ton:

	Pocahontas	Youghiogheny	Fairmont	Bergholz	Ohio No. 8
Freight rate	\$1.45	\$1.00	\$1.15	\$0.70	\$0.90
Lump	3.60				
Lump, 6-in				2.30	
Lump, 1¼-in		2.40		2.10	2.15
Lump, ¾-in		2.30	2.15	2.00	1.95
Egg	3.60				
Egg, 6-in				1.90	
Mine run	2.75	2.15	2.05	1.90	1.85
Slack		1.90	2.00@2.05	1.75	1.75

TOLEDO

Lake movement of coal and ore heavy. Car shortage interferes materially with shipping. Steam demand strong.

The domestic market is showing some weakness, due largely to the pleasant weather conditions. The steam trade is much stronger; the demand is better and prices are stiffer. The car congestion is becoming more noticeable and the grain men have taken the matter before the state commerce commission. There is some heavy shipping both in coal and ore as the season advances. No announcement concerning the close of navigation has been made as yet.

DETROIT

Sales of steam coal diminish. Domestic trade continues in small volume. Anthracite buying lacks activity. Lake shipments near end.

Bituminous—Consumers of steam coal appear to have lost some of the interest which marked their buying a few days ago. The easing off tendency developed after two or three days of increased activity which had aroused expectations of a further improvement. Domestic coal continues sluggish due to mild weather. But despite the less encouraging situation, prices hold closely around mine quotations, even on most of the consignment stock. On some sales of the latter a reduction of 15 to 25c. a ton has been reported on large sizes to avoid demurrage accruing. The quantity of consignment coal on hand is not large. Car shortage reports continue to come from Ohio and Pennsylvania districts.

Anthracite—Little business is now being done in anthracite. Buyers seem to be holding off and orders to shippers are irregular and for small amounts.

Lake Trade—Vessels are difficult to obtain, because of continued activity in other lines. Higher freight rates to Lake Michigan ports in 1916 are expected as a result of ore shippers having made extensive contracts at an advance of 10c. a ton over the rates of this season. By taking a large proportion of the freighters to the Lake Superior route next year, the increased ore rates are likely to cause coal shippers on Lake Michigan to bid higher than the 30c. rate now in effect to the chief unloading ports.

CINCINNATI

Colder weather has so far not affected the market. Car situation has maintained prices.

The coldest weather of the fall was experienced in this vicinity last week, but the domestic demand has not responded, dealers evidently having sufficient coal on hand. The activity in the coking industry has absorbed all available slack, production being at a low level on account of the shortage of cars which has grown worse, rather than better, and when demand reaches normal it is difficult to see how the situation can be handled. In view of these conditions prices are strong and firm, with every indication of further improvement.

LOUISVILLE

Steam sizes improving but considerable domestic grades are on demurrage due to mild weather.

Steam sizes have been moving rapidly and where a week or ten days ago there was no sale for them, they now are in brisk demand. Many of the operators have quantities of domestic coals at shipping centers where it is waiting on demurrage; one day of sharp weather created a flurry in this class of coal but warmer temperatures again eased up the demand.

Sales during the week, long-ton basis, f.o.b. mines, have ranged around $1.75 to $2.10 for eastern Kentucky block, while western Kentucky lump has brought something over $1.25 with slack at 25c. and better.

BIRMINGHAM

Market substantially better, particularly on domestic grades.

Business on both steam and domestic lump coal continues to improve, especially lump, as dealers are beginning to lay in larger stocks. The car supply outlook is a potent factor, as it is feared that there will be a serious shortage by the first of the year. While the improvement on steam coal is not so marked, still conditions are better than they were thirty days ago, and showing a steady improvement as winter approaches. New mines are being opened, and others are running practically full time.

COKE

CONNELLSVILLE

Prompt furnace coke much easier and foundry softens a trifle also. Some contracts for next year. Production and shipments slightly decreased.

So far as the relation between demand and supply is concerned the bottom has fallen out of the prompt furnace coke market. There is very little demand and there are supplies in excess of the demand, but holders are not thus far under any necessity of selling, it being only very recently that they could have disposed of prompt coke to very good advantage. There would be no difficulty in buying spot furnace coke at $2.25, against $2.40 to $2.50 quoted a week ago. The softness in spot furnace coke has been reflected in only small degree in the spot foundry coke market, which is only a shade easier.

The Youngstown Sheet and Tube Co. has renewed its contracts for furnace coke with the two interests now serving its four stacks, but the new contracts run only for the first three months of 1916, or up to the time when the company's new byproduct coke plant at Youngstown is expected to be in operation. The contracts involve about 70,000 tons a month and the price is reported to be close to $2.50, as the delivery is for the period of 1916 for which the highest prices are expected. A contract could be made over the whole year at much less. Corrigan, McKinney & Co. are understood to have contracted for about half their requirements for 1916, with the interest that now has the entire tonnage. We quote: Prompt furnace, $2.25; contract furnace, first half, $2.35@2.50; year, $2.25@2.35; prompt foundry, $2.90@3.15; contract foundry, $2.90@3.15, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Nov. 6 at 424,162 tons, a decrease of 8,357 tons, and shipments at 426,093 tons, a decrease of 15,818 tons.

Buffalo—The demand is good and if the seller has genuine Connellsville foundry product on hand he can obtain the full circular price for it, which runs as high as $5 for best 72-hr. foundry, with gradations for lower quality down to $4.35 for stock coke. At the same time there is coke on the market that sells for considerably less than these figures. There are predictions that the prices will advance still further, as the supply of men is very short and does not promise to improve right away.

Chicago—The foundry-coke market retains its strength, and has been steady all week at $5.50; an increased tonnage of Connellsville has been sold at the same price. Byproduct sizes have softened slightly owing to unseasonable weather. The demand for gashouse coke has been steady. Prices per net ton f.o.b. cars Chicago are as follows: Byproduct foundry, $5@5.50; byproduct domestic, $4.75@5; Connellsville, $5.50; Wise County, $5@5.25; gas coke, $4@4.25.

Birmingham—With the large number of furnaces already in blast, and others being repaired and going into blast, the coke market is strong with the demand equal to the output. Several large contracts for shipments over the next twelve months have recently been made to one of the large iron producers, and another company will put into blast immediately a battery of ovens which has not been operated for several years. Shipments of foundry coke are improving. Prices on both grades are satisfactory.

MIDDLE WESTERN

GENERAL REVIEW

Colder weather gives impetus to domestic trade. Fine coals stronger and upward trend on steam grades. Smokeless market softer.

Temperatures became much lower during the close of last week and this had a beneficial effect, accumulated stocks of domestic sizes beginning to melt away immediately. Colder weather has brought about a renewal of buying, and with both labor and car shortages, together with comparatively small stocks in the hands of dealers, it is felt that the reaction of the past few weeks will not be repeated during the balance of the season. Prices are generally well maintained, although in spots concessions have been made to move coarse sizes accumulated at the mines. Lack of car supply has been a potent factor in restricting shipments of consignment coal during the recent warm weather, the railroads in some cases not furnishing empties where unbilled coal on hand amounted more than 50% of the daily output.

Railroad requirements have been generally increased due to heavier traffic. The volume of steam coals moving is now in excess of last year's tonnage to date. The general attitude of the Western producers has been to curtail operating time rather than to force the markets. Screenings have gained strength from the curtailment of domestic production, and contract demands leave no surplus fine coal. Industrial centers are in full blast, and unloading of coal shipments is prompt with little disposition shown to delay equipment.

CHICAGO

Operations curtailed to meet a slowing up in the demand. Considerable slack going into storage. Arrivals of Eastern coal light.

Franklin County operators have been restricting production; it is said they now have 150,000 tons of slack stored on the ground. Southern Illinois screenings are being sold at 50c. in Chicago and 60c. at interior points. A number of Williamson County mines have closed down, preferring to be idle rather than to force the higher grade coals on the market.

All grades in the Springfield district are in slight demand, and some mines have been compelled to suspend operations for a few days. A little domestic coal has been moving as low as $1.50, but strict adherence to the $1.75 price is observed by most operators. Screenings are steady.

Indiana operators are more optimistic on the outlook, as manufacturing plants of the state have obtained a large volume of war orders. No. 4 domestic demand has softened, and orders for Nos. 5 and 6 grades are heavier.

This market has called for relatively little smokeless coal during the past ten days. Apparently the car supply at the smokeless mines has improved and more spot shipments are reaching Chicago, which has softened prices. Lump is weaker, but egg is in better demand, and nut is active. Pennsylvania smokeless is still strong owing to lack of cars. All-rail splint is reaching too high prices to be an attractive buy.

Hocking domestic trade has been quiet, but with colder weather prices are likely to be higher. Stocks are only fair, and buying will soon be necessary.

An easing in the demand for anthracite has occurred and prices have weakened due to the unsold coal on track, although the circular is being strictly observed in the outlying Western territory. Many complaints are made that all-rail orders are slow in being filled and the movement is slow. Stocking by Western dealers is still behind other years.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.
Lump	$1.65@1.75	$1.60@1.75	$1.50@1.60	$1.50@1.60	$1.50@1.60

INDIANAPOLIS

Mild weather continues, curtailing the demand for domestic grades of coal and restricting production. Screenings stiffening. Some mines closed for lack of cars.

Fair weather is still against the movement of domestic grades and this has cut down the production of screenings, with the result that there has been a stiffening of prices on the latter. There are few if any sales under 60c. f.o.b. mines. Operators are experiencing the first real car trouble and some mines are shut down. The railroads report a shortage, even in box cars.

The industrial demand for coal has made no special improvement recently, but continues much better than in the spring or summer. Sentiment is growing more optimistic. Railroad buying has increased considerably the last month. Mines have been going into operation week by week in all parts of the Indiana field.

ST. LOUIS

Domestic demand stimulated slightly by cooler weather. Prices fairly steady.

Slightly colder weather has quickened the demand somewhat for domestic grades, but a much greater drop in temperature is needed before there will be any substantial improvement. Reduced operation has forced the price of Staunton and Standard screenings still higher. Prices of the lump grades have been kept fairly steady by a considerable effort. There has been sporadic selling at prices below the quotations, but in the main the prices have held. The prices of nut, pea and slack continue better than at this time last year.

Quotations f.o.b. mines during the past week have ranged on the following basis per short ton:

	Frnk. Co.	Wlmson. Co.	Staunton	Standard
6-in. lump	$1.50@1.75	$1.50@1.75	$1.25@1.35	$1.25
8-in. lump	....	....	....	1.25
2-in. lump	....	....	1.15@1.20	1.00@1.10
3x6 egg	1.40@1.75	1.40@1.65	....	1.00
2x6 egg	....	....	....	.80@.85
No. 1 nut	1.50@1.75	1.50@1.75	....	.80

No. 1 washed	....	1.65	1.50	....
No. 2 washed	....	1.25	1.10@1.25	....
No. 3 washed	....	1.25	1.10@1.25	....
No. 4 washed	....	1.20	1.05	....
No. 5 washed	....	.60@.70	.50@.60	....
Screenings	.60@.65	.60@.65	.30@.35	.30@.35

Freight rates—Inner group, St. Louis 57½c.; East St. Louis 37½c. Outer group, St. Louis 72½c., East St. Louis 52½c.

DULUTH

Coal receipts continue light. No great activity in shipping. Anthracite firm.

Figures given out during the week show a decrease in receipts of bituminous coal for the month of October over the corresponding month of last year, of 209,134 tons and a decrease in the total receipts for the season to Nov. 1 of 1,735,687 tons. This large falling off is due to the fact that all the shipping companies carried over heavy stocks from the previous year, the amount in storage at the present time being well up to that of former years, so that no shortage is anticipated. Nearly all the dock companies report shipments of bituminous a little below the average. The lack of inquiry is attributed to the large amount of work that had to be done on the farms this fall, and to the mild and pleasant weather, that has prevailed for the past six weeks. No change in quotations has been announced, but prices remain firm. Quotations for immediate delivery, f.o.b. cars, per short ton, are as follows:

	Yough	Splint	Hock	Smokeless	Elkhorn
Lump	$3.40	$3.40	$3.40	$4.75	$3.75
Dock run	3.10	3.10	3.05	3.25	3.25
Stove or nut	3.40	3.40	3.40	4.75	3.65
Screenings	2.40	2.40	2.25	2.75	2.40

Figures compiled during the past week show an increase in the receipts of anthracite for the month of October over the same month last year of 26,493 tons and a total increase for the season to Nov. 1 of 74,920 tons. The demand has been fairly well maintained in spite of the very mild weather and with a little touch of winter, a brisk inquiry is bound to arise. Quotations are as follows: Egg and stove, $6.85; nut, $7.10; pea, $5.55 and buckwheat, $4, all f.o.b. cars, per short ton, at Duluth.

PRODUCTION AND TRANSPORTATION STATISTICS

EXPORTS

Exports of domestic coal and coke from the United States, and bunker coal laden on vessels engaged in the foreign trade at the specified districts, during the month of September, 1915, were as follows:

	Anthracite	Bituminous	Coke
Maine and New Hampshire	971	22	......
Maryland	......	200,926	208
Massachusetts	252	2	......

BUNKER COAL

Districts	Gross Tons	Districts	Gross Tons
Maryland	48,456	Philadelphia	29,648
New York	284,634	Virginia	162,190

LAKE SHIPMENTS

Shipments of anthracite through Sault Ste. Marie Canal for October amounted to 260,188 tons and bituminous shipments were 1,643,283 tons.

FOREIGN MARKETS

GREAT BRITAIN

Nov. 5.—Conditions in the market for steam coals remain quiet. With stocks excessive, it is possible to secure supplies of large and small coals on very cheap terms for immediate shipment, although sellers are not prepared to take such figures for more backward delivery. Quotations are approximately as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$4.32
Best seconds	Nominal	Seconds	4.20
Seconds	$4.32	Best Cardiff smalls	2.52
Best dry coals	5.64	Cargo smalls	1.68

The prices for Cardiff coals are f.o.b. Cardiff, Newport or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is very quiet. Tonnage is still scarce and rates strong. Rates are approximately as follows:

Gibraltar	$6.72	Naples	$10.80	St. Vincent	$7.20
Marseilles	10.61	Alexandria	11.76	River Plate	9.00
Algiers	7.76	Port Said	11.76		
Genoa	10.80	Las Palmas	6.60		

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on page 16.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared:

No.	Purchaser	City	State	Tonnage	Page
1594	County Government	Arvilla	N. D.	100b	736
1611	County Government	Williston	N. D.		786
1628	Newark City Hall	Newark	N. J.	1,000a	828
1633	Central Purchasing Com.	New York	N. Y.	10,000a	829

a Indicates anthracite coal. b Indicates bituminous.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

+1193—Turtle Creek, Penn.—Bids on this contract (p. 244), which provides for furnishing the township school board with coal were as follows, per bushel: James Queen, lump, 7½c., slack, 4½c.; Jas. J. Young, lump, 8c., slack, 5c.; Geo. L. Shauer, lump, 8c., slack, 5c. Address Secy. Wm. E. Taylor, Patter Township School Dist., Turtle Creek, Penn.

+1463—Little Falls, Minn.—W. H. Ryan and Julius Jetka were the only bidders on this contract (p. 530), both of their bids being $5 per ton delivered at the City Hall. Address City Clk. Victor Schallern, Little Falls, Minn.

1617—Brooklyn, N. Y.—Bids on this contract (p. 786) for furnishing and delivering 3,300,000 lb. of egg coal to various public buildings, courts and baths, were per 1,000 lb.: Bacon Coal Co., $2.96; Thomas W. Woods Sons, Inc., $2.95½; John F. Schmadeke, Inc., $2.85. Deliveries are to be made by Dec. 31, 1915. Address Pres. L. H. Pounds, Borough of Brooklyn, Borough Hall, Brooklyn, N. Y.

1619—Pleasantville, N. J.—Bids have been received on this contract (p. 787), which provides for furnishing the Atlantic County Board of Freeholders with approximately 200 tons of Lehigh Valley pea and 150 tons of stove as follows: Geo. W. Bailey Co., pea, $4.25, stove, $6.38; Williams Darnell & Co., pea, $4.25, stove, $6.40; W. W. Clark, pea, $4.40, stove, $6.50. Address Supt. T. L. McConnell, Pleasantville, N. J.

1626—New York, N. Y.—Bids on this contract (p. 828), calling for the furnishing and delivery of 3,000 gross tons of buckwheat No. 1 for the Bellevue and Allied Hospitals were as follows: Gavin Rowe, $2.93 and Pattison & Bowns, $3.07, per gross ton. Address Board of Trustees, Bellevue and Allied Hospitals, 400 East 29th St., New York, N. Y.

1630—Buffalo, N. Y.—G. Alias & Bros., Inc., report under date of Nov. 15 that no deal has yet been concluded on this contract (p. 828), involving approximately 1,000 tons. Address Pur. Agt. I. Gillespie, G. Alias & Bros., Inc., 965 Elk St., Buffalo, N. Y.

New Business

1634—Granite City, Ill.—The American Steel Foundries Co. of this place are in the market for a contract covering their fuel requirements until Apr. 1, 1917. They require approximately 2,000 tons per month of 1¼-in. screenings and 700 tons of Nos. 3 and 4 washed. Quotations should be submitted f.o.b. their plant on the Terminal R.R. at Granite City. Address Pur. Agt. T. E. Moritz, Chicago, Ill.

+1635—Denver, Colo.—The Custodian of the United States Post Office at this place received bids untl 2 p.m., Nov. 19, for furnishing its annual fuel requirements during the ensuing year. The contract involves about 600 tons of a good grade of bituminous coal. Address Custodian B. F. Stapleton, United States Post Office, Denver, Colo.

1636—Chester, Penn.—The Keystone Fibre Co. at this place usually send out inquiries for their annual requirements of best Somerset County coal about Dec. 1, and the contract is concluded Apr. 1. Deliveries are made by Baltimore& Ohio R.R. Address Pur. Agt. Marcy, Keystone Fibre Co., Chester, Penn.

+1637—Philadelphia, Penn.—The Philadelphia County Prison received bids until noon, Nov. 19, for supplying approximately 2,000 tons of buckwheat anthracite coal, to the Reed street and Holmesburg prisons. Bids will be considered only on Lorberry, Lykens Valley, Wyoming or Susquehanna coal. Tenders are also requested on 100 tons of white ash stove coal. For bids and awards on previous contracts of the Philadelphia County Prison see pp. 448, 578. Address, Supt. Fred. A. Cooke, Philadelphia County Prison, 10th and Reed St., Philadelphia, Penn.

1638—Camden, N. J.—The Farr & Bailey Mfg. Co. at this place usually send out inquiries concerning their annual fuel requirements involving approximately 20,000 tons of coal on Nov. 1. Deliveries are made by Pennsylvania R.R. and the contract is let on Apr. 1. Address Pur. Agt. Harwell, Farr & Bailey Mfg. Co., Camden, N. J.

1639—Florence, N. J.—The Florence Thread Co. at this place usually send out inquiries concerning their fuel requirements involving approximately 2,500 tons Somerset County coal on Nov. 1, and the contract is concluded on Jan. 1. Deliveries are made by Pennsylvania R.R. Address Pur. Agt. Thatcher, Florence Thread Co., Florence, N. J.

+1640—Lebanon, Penn.—The American Iron and Steel Manufacturing Co. is receiving bids for a portion of their annual fuel requirements involving approximately 40 000 tons of slack coal. Only a coal running very high in volatile, low in ash, and with sulphur under 1½% will be considered. Address Pur. Agt. George S. Bowman, American Iron and Steel Manufacturing Co., Lebanon, Penn.

1641—Fort Pierre, S. D.—The Board of County Commissioners at this place received bids until 2 p.m., Nov. 16, for furnishing anthracite and bituminous coal in carload lots, bids to include cost of delivery to the Court House. Address Chn. H. L. Jeffries, Bd. of County Comrs., Fort Pierre, S. D.

+1642—Bayonne, N. J.—The City Commissioners will receive bids until 4 p.m., Nov. 23, for furnishing and delivering to the various fire houses and police headquarters, approximately 200 tons anthracite egg and stove coal. Bids are requested only on Wilkes-Barre coal, and a deposit for 10% of the bid must accompany all tenders. Deliveries are to be completed before May 1, 1916. Address City Clk. Wm. P. Lee, Bd. of Comrs., Bayonne, N. J.

+1643—Birmingham, Ala.—The Birmingham Railway, Light and Power Co. contract for their annual requirements of coal, involving approximately 30 tons per day, some time toward the close of the year. Washed slack is required and deliveries are made by railroad. Address Pur. Agt. Chas. P. Doerr, Birmingham Railway, Light and Power Co., Birmingham, Ala.

+1644—Maryland, N. Y.—The Union Free School District No. 2 received bids until 7 p.m., Nov. 8, for furnishing one carload of coal. Address Clk. R. B. Safford, Union Free School Dist. No. 2, Maryland, N. Y.

1645—Wheeling, W. Va.—The City Electric Light Plant at this place contracts some time in December for their annual fuel requirements, involving approximately 3,000 tons of mine-run coal. The business is done on competitive bids, and the customary price is about $1.80 per ton delivered in the bins. Address Supt. W. B. Kain, City Elec. Lt. Plant, Wheeling, W. Va.

1646—Media, Penn.—The Borough Government at this place is in the market for their annual supply of Lykens Valley anthracite pea coal for the year of 1916. Address Clk. Ed. Minton, Media, Penn.

+1647—Ada, Minn.—The Norman County Board received bids until 10 a.m., Nov. 18, for furnishing coal as may be required to the Local Court House during the coming season. Address County Audr. D. E. Fulton, Norman County, Ada, Minn.

+1648—Jersey City, N. J.—Bids will be received by Hudson County until 3 p.m., Nov. 24, for furnishing coal to the county institutions at Jersey City and in Secaucas County. Address Clk. Walter O'Mara, Bd. of Chosen Freeholders, Hudson County, Jersey City, N. J.

+1649—Denver, Colo.—The Mine and Smelter Supply Co. is requesting bids on a 30- to 40-ton car of Piedmont coal. Quotations should be made f.o.b. Denver. Address Gen. Pur. Agt. W. B. Kinkead, The Mine and Smelter Supply Co., Denver, Colo.

+1650—Philadelphia, Penn.—The Department of Supplies will receive bids until noon, Nov. 24, for furnishing the Police and Fire Department with coal during the balance of the current year. Complete details may be obtained from proposal form, Class No. 175, which may be had upon application. Address Director Herman Loeb, Dept. of Supplies, City Hall, Philadelphia, Penn.

+1651—Norfolk, Va.—The United States Engineers will receive bids until noon, Dec. 20, for furnishing approximately 3,000 tons of bituminous coal. For previous bids and awards on this contract, see contract No. 550, Vol. 7, pp. 709, 1004. Complete details may be had on application. Address United States Engineer's Office, Custom House, Norfolk, Va.

1652—Norfolk, Va.—The Navy Department is requesting bids for furnishing and delivering to the local Navy Yard 600 tons of Connellsville coke. Specifications may be obtained on application for schedule No. 9034. Address Paymaster General, Samuel McGowan, Navy Dept., Washington, D. C.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+1360—Hannibal, Mo.—This contract (p. 411), which provides for furnishing the Board of Public Works with approximately 12,000 tons of coal during the year beginning Oct. 1, has been awarded to the **West End Coal Co.**, of Springfield, Ill., at $1.35 per ton f.o.b. Hannibal for slack, and $1.97 for mine-run. The price at which slack coal was bought last year was $1.34 per ton. Address Supt. A. M. Nipper, Bd. of Pub. Works, Hannibal, Mo.

+1555—McKees Rocks, Penn.—This contract (p. 661), which provides for furnishing the Stowe Township School District with 1¼-in. coal has been awarded to **John B. Beck** at 9½c. per bu. Address Secy. H. E. Emeigh, 907 Russellwood Ave., McKees Rocks, Penn.

1566—Cleveland, Ohio.—This contract (p. 699), which provides for furnishing Cuyahoga County with 2,000 tons of Pittsburgh nut coal, 100 tons of the best grade bituminous lump, and 30 tons of the best Lackawanna egg coal, has been awarded to the **Zettlemyer Coal Co.** Address Clk. E. G. Krause, Cuyahoga County Commissioners, Cleveland, Ohio.

+1567—Hettinger, N. D.—This contract (p. 699), which provides for furnishing the Adams County Board of Commissioners with No. 1 lignite coal has been awarded to **Chas. Hasenwinkle** at $2.90 per ton. Other bids on this contract were: William Fehro, $3; W. A. Overing, $3; W. Hitzman, $3. Address Audr. Walter F. Kelley, Adams County Comr., Hettinger, N. D.

1575—Fountain Springs, Penn.—This contract (p. 700), which provides for furnishing the State Hospital with approximately 2,500 tons of anthracite pea coal, has been awarded to the **Philadelphia & Reading Coal and Iron Co.**, at $2.25 f.o.b. the mine, plus the Pennsylvania State tax. Address Supt. Dr. J. C. Biddle, State Hospital for Injured Persons, Fountain Springs, Penn.

1590—Trenton, N. J.—This contract (p. 736), which provides for furnishing the Pumping Station with approximately 7,000 tons of coal, has been awarded to **The Tattersall Co.**, at $3.60 per ton for 3-in. from the Crow's Nest mine. The contract provides that the coal shall not exceed 8% ash and have at least 14,250 B.t.u. Address City Chemist Parobek, Municipal Bldg., Trenton, N. J.

Contract Notes

Coxsackie, N. Y.—American Valve Co. at this place consumes approximately 600 tons of bituminous and 500 tons of anthracite coal per annum. They have storage capacity for 300 tons, and deliveries are made by railroad.

Daytona, Fla.—The Daytona Public Service Co. consumes approximately 3,600 tons of New River mine-run coal per year, which cost about $5.85 per ton delivered. Address Pur. Agt. H. L. Ogden, 72 Franklin St., Boston, Mass.

Memphis, Tenn.—The contract for furnishing the Park Commissioners with five cars of egg coal has been awarded to the **Brown Coal Co.**, at $4.19 per ton, delivered on switch at McLean Ave. Address Park Commissioners, Memphis, Tenn.

Litchfield, Ill.—The United Gas and Electric Co. at this place consumes about 3,000 tons of Illinois mine-run coal per annum, the approximate cost of which is $1.35 per ton. Purchases are made at the rate of five to ten cars in the open market.

Philadelphia, Penn.—C. Schmidt & Sons Brewing Co., at this place, consume approximately 5,900 tons of bituminous coal per annum. Deliveries are made by railroad as required Address Pur. Agt. R. McAllister, C. Schmidt & Sons Brewing Co., 127 Edward St., Philadelphia, Penn.

Chicago Heights, Ill.—A charge has been made that the city of Chicago Heights, which recently awarded a coal contract for a large tonnage to the Chicago Heights Coal Co., wrongfully refused to consider the lowest bidder. The difference in the bids is said to have been approximately $380.

Winston Station, N. C.—The Chatham Manufacturing Co. at this place, consume approximately 2,500 tons of Pocahontas coal, deliveries being made by railroad as ordered. The company has storage capacity for 300 tons. Address Pur. Agt. H. G. Chatham, Chatham Manufacturing Co., Winston Station, N. C.

Philadelphia, Penn.—R. T. Morehouse consumes about 10,000 tons of anthracite barley, and 5,000 tons of bituminous coal per annum. He has storage capacity for 20,000 tons, and deliveries are made by water in cargo lots. No contracts are made. Address R. T. Morehouse, Bridesburg, Philadelphia, Penn.

Philadelphia, Penn.—Folwell Bros. Co. consume approximately 10,000 tons of bituminous coal per annum. They have storage capacity for 350 tons, and deliveries are made by railroad at the rate of 150 to 250 tons per week. Address Pur. Agt., E. O. Mangen, Folwell Bros. Co., Third and Cambridge St., Philadelphia, Penn.

Cleveland, Ohio—The Union Rolling Mill Co., at this place, consumes approximately 36,000 tons of three-quarter and 9,600 tons of slack Ohio No. 8 coal. Deliveries are made by railroad at the rate of 3,800 tons per month, and the company has a storage capacity for 500 tons. Address Secy. M. L. Hopkins, Union Rolling Mill Co., Aetna Road and East 82d St., Cleveland, Ohio.

Selma, Ala.—The A. G. Kalin Brick Co., at this place, consume approximately 2,900 tons of pea and slack and 2,000 tons of nut and lump coal per annum. Deliveries are made by railroad at the rate of from two to three cars per week, and the company has a storage capacity for 800 tons. Address Pur. Agt. A. G. Kalin, A. G. Kalin Brick Co., Water Ave., Selma, Ala.

Zanesville, Ohio—**Greiner Bros.** were the lowest bidders for the coal supply for the operation of the water-works pumping station at this place and will receive the contract. Their bid was $9,450, or $1.34 a ton. The total amount of the bid was $1,100 less than for the same amount last year. Other bidders were T. A. McIntire, $1.45; W. L. Barker, $1.62½; W. A. Werner, $1.65.

Akron, Ohio—Contracts have been let for 11,500 tons of coal for the city. The **Citizens' Coal Co.** will handle the contract for supplying 5,000 tons of bituminous nut and slack for the water-works and 6,000 tons for the garbage and sewage disposal plant, delivery on tracks only, while the **Klages Coal Co.** will deliver 500 tons at $2.80 for the use of the city buildings.

Foreign Notes

Uruguay.—An American consular officer in Uruguay states that a firm desires to represent American manufacturers of coal and coke. Correspondence may be in English.

Spain—An American consular officer in Spain reports that a man in his district is interested in the importation of American coal for steamers, coke, and coal for gas. The man states that he can use at present 2,000 tons of steam coal, 200 tons of coke, and 500 tons of gas coal. Correspondence should be in Spanish.

Brazil—A firm of commission agents in Brazil informs an American consular officer that it would be pleased to represent American manufacturers and exporters. One member of the firm has had considerable experience in the sale of coal and desires to make a specialty of this. Other lines are not specified. Correspondence may be in English.

Financial Department

Central Coal and Coke Co.

This company reports for year ending Jan. 1, 1915:

⁂

The New River Company

President Robt. H. Gross, under date of May 13, reports for the year ended Mar. 31, 1915:

After paying interest on $2,500,000 outstanding bonds and $600,000 outstanding notes, a profit of $17,538 was earned, which compares with a deficit of $57,422 for the preceding year and a deficit of $211,914 for the year ended Mar. 31, 1913.

For the first six months of the fiscal year the output of the mines operated by subsidiary companies increased while the costs were steadily reduced, and the selling price showed a gain month by month, giving good grounds for the hope that substantial earnings would be made for the year. In October, however, the industrial conditions became so badly demoralized that the demand began to show a falling off, which was reflected in a smaller output with an increased cost and a reduced profit.

The output of the mines shows an increase of 128,747 gross tons for the year, and each month from April to October inclusive shows a gain in tonnage. The output for November, December, February and March fell below 130,000 tons per month, and it was in these months only that losses were sustained, showing conclusively that it is necessary to produce and dispose of a tonnage of 130,000 tons or over per month to prevent showing a loss.

General Manager S. A. Scott, reported on May 8, 1915:

Improvements—New equipment has been added in the form of capital expenditure aggregating $235,351. Virginian Power Co. installations to date at the various mines amount to $198,461. Improvements have been made and taken directly into cost, aggregating $39,397.

The new electrical equipment that is being purchased and installed to take the place of the old steam equipment is being gradually put in place. Installations have been completed at all of the mines on Loup Creek and boilers abandoned. In the Cranberry field, the Beckley installation is completed and Beckley and Mabscott mines and a portion of Sprague are being supplied with Virginian power. It is safe to say that two months more will complete the installations necessary for the use of Virginian power at all our mines excepting Summerlee and Lochgelly, and these will be completed by Oct. 1.

Sales of Coal—Sales were made to the extent of practically 2,000,000 tons early in the year. The close of the year showed that most of the customers had taken only 80% of the coal for which they had contracted. Our average net return on lump coal was the same as the previous year; our egg coal showed an increase of 7c. per ton, run-of-mine, an increase of ½c.; slack, an increase of 15c. The combined grades showed an increased return of 3c. per ton.

The retail yard at Cincinnati was disposed of which completes the sale of all our retail yards, and we have already placed for the next year a greater tonnage in Cincinnati than we have ever handled through our yard.

Outlook for 1915—Our sales department has already booked a substantial tonnage, a great deal of it new business, and there is little doubt that we will close contracts aggregating 2,000,000 tons of coal. The mines are in condition to produce coal up to 2,500,000 tons.

OUTPUT AND EARNS. OF SUBSIDIARY OPER. COS. AND AMOUNTS THEREOF BELONGING TO NEW RIVER CO., YRS. END. MAR. 31

COAL AGE

Vol. 8 NEW YORK, NOVEMBER 27, 1915 No. 22

The Unconsidered Cost

An address to mine owners, managers, superintendents and all who are interested in the cost of producing coal

* * *

DO YOU know where one of the most constant and unconsidered factors in the cost of your business exists—a factor of cost which injures you seriously enough in dull times, but which in prosperous seasons is less considered and is therefore still more harmful?

It is the cost of hiring and firing men. Don't you consider your payroll your greatest single current liability? Don't you have to hustle to get cash to cover your wage accounts oftener than you do to meet other current bills? You can get manufacturers and other large corporations to wait, but there must be no delay in the matter of satisfying your company's liability to its employees.

Your men also are vitally interested in your payroll. It represents to them their possibilities of reward for faithful service and assures creature comforts for themselves and their loved ones.

You are careful enough in some ways about your payroll. You get a good timekeeper and you bond him. But this is not enough. You must dig down and examine closely the composition of the payroll. Serious study must be given to the human elements that it comprises. If the tonnage divided into the gross roll shows a fair cost per ton, the result must be considered favorable. However, it is a poor management that stops here; for it is at this point that the unconsidered loss begins.

This loss is made up of the dollars in wages paid to new and inefficient men—for the training of poor workmen who have no intention of remaining permanently and for competent men whom your foreman through lack of tact or system either fires or lets get away.

This is a drain on the reservoir of resources that too many concerns allow to exist. Mine officials demand the very best machinery and material. They want wire ropes that will not break, locomotives that will not get out of order, mining machines that stand wear and tear, which are all very well. But that manager or superintendent who neglects the biggest factor of all—labor—will have a never-ceasing leak in his reservoir of earnings.

It costs something to hire and train new men, and this cost increases from common to skilled labor. Furthermore, it is an unproductive outlay unless the new men are retained in the organization as dependable productive units.

Each mine official should know how many men it requires to mine and convert any specified quantity of raw material into a saleable product. Using this information as a basis, a quota of men should be established for each department. The number of men employed by each foreman to keep his force intact should be watched carefully. It may be that certain foremen have to hire two or three men to keep one man on the job. What this costs can be ascertained, and it is probable that the result of such an examination will convince you that your foreman had better be replaced by another.

Discover how many efficient men you have by keeping a record of attendance over a long period of time. You can have employees of 80 or 90 per cent efficiency just as easily as you can those of 60 or 70 per cent efficiency.

It is only fair to the man you hire, as well as to yourself, that he be fit for the job he is to fill. *Coal Age* readers would like to hear from those mine officials who have given conscientious study to their payrolls and who have evolved a system or obtained results that are highly creditable.

Neutralizing and Softening Mine Drainage Water

By J. R. Campbell*

SYNOPSIS—Mine water contains temporary and permanent hardness and free acid. In the raw state it is therefore unfit for either coke quenching, boiler feeding or domestic purposes. It may, however, be so treated with lime and soda ash as to be available for these uses at times when other sources of supply become inadequate.

During the falls of 1914 and 1915 there was a scarcity of fresh water in certain sections of the Connellsville coke region, which depended upon impounded water for the operation of the plants. As the shutting down of the plants would have caused a loss of output, which was particularly undesirable in the latter part of 1915, and a high overhead charge, it was determined to utilize the so-called "sulphur water" for industrial purposes, after proper chemical treatment.

The scheme was carried out in its entirety at the United plant of the H. C. Frick Coke Co., where the treated water was used for "watering out" ovens, for boiler feeding, and, with a certain degree of success, for domestic purposes. At other plants, the mine water was simply neutralized and clarified for oven purposes.

The use of the raw water for this latter purpose in the past had always been attended with more or less trouble and expense on account of the "free acid" eating out the yard lines, valves, etc. Moreover, the coke was badly stained with the iron deposit, to which consumers objected. After neutralization and sedimentation, the mine water proved quite satisfactory for quenching purposes. Coke watered in this way could not be distinguished from that on which fresh water had been used.

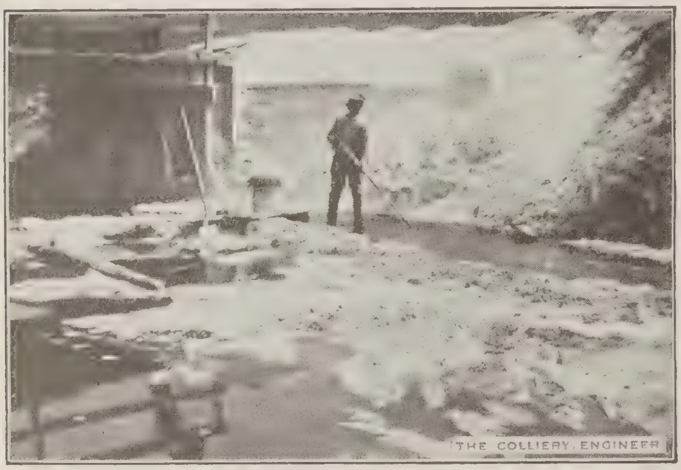

FIG. 1. METHOD OF INTRODUCING THE LIME

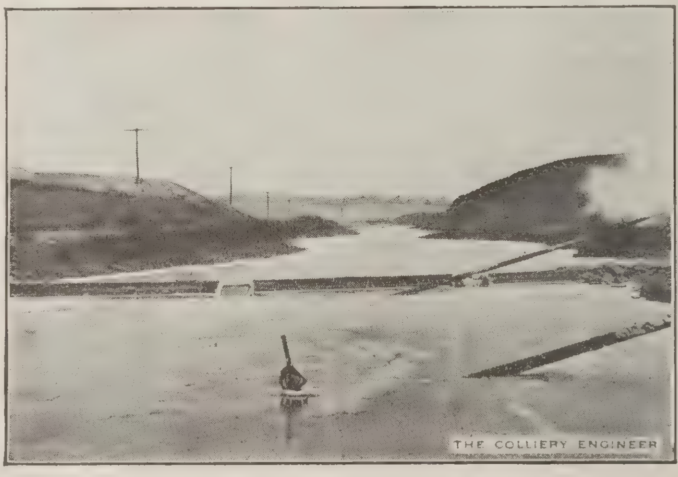

FIG. 2. SEDIMENTATION DAM

Good Sedimentation Was Difficult

The use of neutralized and softened water for boiler feeding was successful, but rather annoying at times, with the crude methods that had to be used. The greatest difficulty was in getting good sedimentation with the continuous method of softening employed. The softened water still carried considerable calcium and magnesium carbonate ($CaCO_3$ and $MgCO_3$) in suspension, which entered the boilers and caused priming. Furthermore, the sludge collected on the tubes and caused them to burn out. Quite a few were lost in this way. On the whole, however, the boiler plant emerged from its siege of mine water in pretty good condition and free from scale.

The completely softened and settled water was satisfactory for washing and scrubbing purposes in the town, but on account of the disagreeable taste caused by the large quantity of sodium carbonate or soda ash (Na_2CO_3) present it was not used for drinking purposes. If the barium carbonate or witherite ($BaCO_3$) method of softening instead of sodium carbonate (soda ash) could be put on a commercial basis, mine water could be freed from practically all objectionable minerals and should prove just as acceptable for drinking purposes as impounded water, certainly more so from a bacteriological standpoint. The neutralized and softened mine water was clear and sparkling. The taste was the only thing against it.

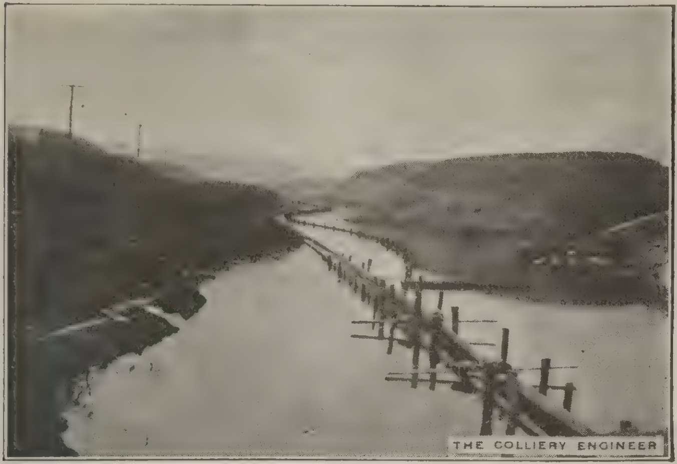
Chemistry of Mine Water Treatment

It is not the purpose of this article to enter into a technical discussion of the composition of mine water and the methods employed in treating it. In fact, no hair-splitting was permissible in this case. Jim Barr, the machinist at United, armed with a bottle of methyl orange and a pinch of soda ash, was the chemist on the job, and he never went far wrong. With the one he knew when the water was neutral, and with the other he could at least tell when enough soda ash was being used.

The well-known lime and soda ash method was employed—the lime to neutralize the "free acid" and to precipitate the iron salts, the soda ash to soften. The manipulation of this process is well illustrated by the method pursued at the United mine.

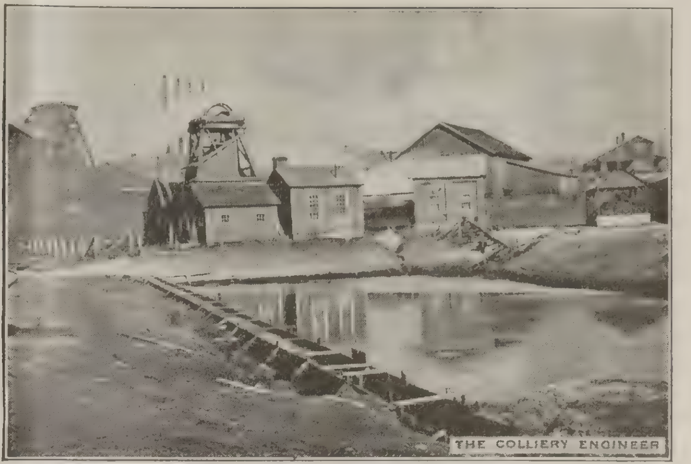
---

*Chief Chemist, H. C. Frick Coke Co.



THE COLLIERY ENGINEER

FIG. 3. BYPASS ARRANGEMENT



THE COLLIERY ENGINEER

FIG. 4. A TREATMENT FLUME

At this operation the acid mine drainage available was a stream that ran past the plant. Ordinarily it contained considerable fresh water, but in droughts was practically nothing but the drainage from the mines above.

The approximate analysis of the creek water was as follows:

	Grains per U. S. Gal.
Total apparent acidity....................	105
Lime required (80 per cent. CaO)..........	73

To determine the flow of water, a weir was used, which showed from one-half to three-fourths of a million gallons daily. To neutralize all this, on the basis of the analysis, required anywhere from 2½ to 4 tons of lime per day, depending upon the flow of water and its acidity. The lime used was not always well-burned, so there was a loss on that account.

The daily plant requirements were only as follows:

	Gal.
Ovens	170,000
Boilers	100,000
Houses	30,000
Total	300,000

Thus it is seen that to neutralize the whole stream took twice as much lime as was actually needed. During the fall of 1915, arrangements were made to bypass such raw water as was not needed, the arrangement for which is shown in Fig. 3. This bypass was merely a flume down the center of the stream. Similar arrangements were made at all plants using mine water.

Lime Was Introduced by Hand

Fig. 1 shows the "method" of introducing the lime. At the moment of the snapshot, the "mechanism" apparently was not working, but on the whole the method employed was satisfactory. He soon got to know what the bottle of methyl orange was for. The aim was to keep the water neutral to this indicator. The test of the neutralized water showed a permanent hardness ($CaSO_4$) of 228.3 grains per United States gallon.

By the lime treatment, the water is made harder as the lime combines with the free sulphuric acid and forms calcium sulphate ($CaSO_4$). The "free acid" is usually about 10 per cent. of the total acidity. Then again, the lime decomposes the sulphate of iron, forming additional calcium sulphate or permanent hardness.

It is best to go upstream several hundred yards to introduce the lime, then build a series of dams, the supernatant water flowing over the breast of each successively. The precipitate formed by the addition of the lime settles out rapidly. Provision should be made in the dams for sluice gates for flushing purposes, as the basins fill up in a short time with the iron precipitate.

One of these dams is shown in Fig. 2, in which the pump suctions are seen, one delivering neutralized water to storage tanks for "watering out" ovens only and the other sending a supply to a cistern to be further treated for boiler and house purposes. The pump suction should be just under the surface of the water. A good arrangement is to put a wooden box, perforated with holes on top only over the end of the pipe. Where it is possible, it is still better to locate the pump suction in the backwater from the dam.

Treatment Began with the Flume

The lime is added at the upper end of the flume. The treated water enters storage by the gate at the lower flume end. When not treating, all the water is bypassed around the storage dam by closing the gate. The pump suction is in the backwater at the upper end, where clear and neutral water is found longest.

As has been pointed out previously, the chemical reagent used to soften the neutralized water was soda ash—the cheapest and most efficient chemical. By its use, the sulphates of lime and magnesia are converted to sodium sulphate and lime and magnesia carbonates. The sodium sulphate, of course, is soluble, but the carbonates are precipitated.

The general reaction is as follows: $CaSO_4 + Na_2CO_3 = Na_2SO_4 + CaCO_3$. From this reaction, the amount of soda ash is calculated. One grain of calcium sulphate requires 0.85 grain of soda ash for a complete precipitation. On this basis, the daily requirement of soda ash for the water to be used in the boilers and the houses, was from 3,000 to 4,000 lb. in 24 hr.

The method of feeding the soda ash is shown in Fig. 5. It is simply a barrel holding approximately 100 gal. of water, with a spigot at the bottom, allowing the soda ash solution to run into a pipe tapped to the pump discharge.

Fig. 6 shows the cement cistern, of 150,000-gal. capacity, used for storing the softened water. The soda-ash feeder is kept supplied with softened water by a small hand pump. The pump discharge into the cistern is just below the man standing (see Fig. 6). There is a boxlike arrangement over it to direct the discharge toward the bottom of the cistern, to prevent too much agitation.

The outlet for the softened water is a floating valve, shown in the left of Fig. 6, fastened to a raft. This carried off only supernatant water for boilers and houses. The nearer the cistern was kept full the better were the results on account of a greater precipitating depth.

The following tests are self-explanatory:

	Grains per U. S. Gal.		
	Aug. 28	Aug. 30	Aug. 31
Temporary hardness ($CaCO_3$)......	16.149	33.231	28.684
Permanent hardness ($CaSO_4$).......	69.027	13.292	13.992
Total hardness	85.176	46.523	42.676

It will be noted that sufficient soda ash was not used for some little time. While the amount was calculated as closely as possible, the matter of practical test was left in the hands of the machinist, who was instructed to try out the water with a pinch of soda ash in a bottle. As long as a white precipitate appeared, he was to increase the soda ash. In this way numerous chemical analyses were avoided. Under conditions like these it is not possible to make a full mineral analysis.

The completely softened water is shown in the following analysis:

	Grains per U. S. Gal.	
	Sept. 2	Sept. 11
Temporary hardness ($CaCO_3$).............	36.146	28.480
Permanent hardness ($CaSO_4$).............	0.0	0.0
Soda ash (Na_2CO_3)......................	12.360	10.728
Total hardness	36.146	28.480

From this it will be seen that the water was overtreated with soda ash, there being an excess of 10 to 12 grains to the gallon, which was remedied by chemical control instead of the crude method previously outlined, which at the best only showed when enough soda ash was being used. It will be further noted that the total hardness was reduced from 228.3 grains per United States gallon in the neutralized water to 28.48 grains in the softened water—quite a creditable showing under the circumstances. A regular water softener probably would not have shown hardness lower than 6 grains per United States gallon.

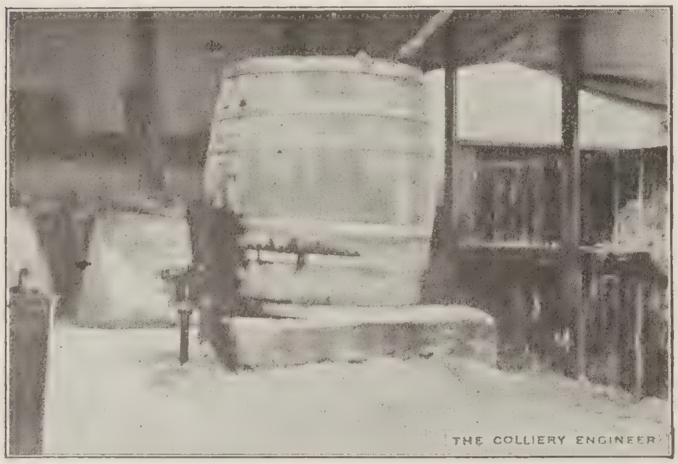


FIG. 5. METHOD OF FEEDING THE SODA ASH

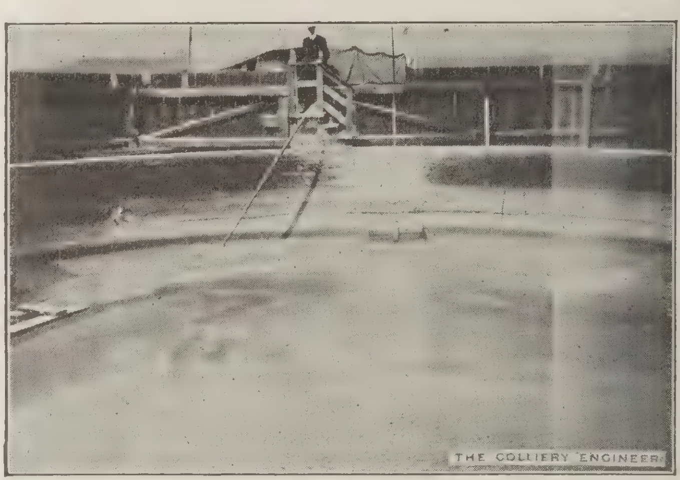

FIG. 6. CEMENT CISTERN FOR SOFTENED WATER

Unremoved Precipitate Was Objectionable

The amount of precipitate still floating in the softened water was objectionable in the boilers, since it caused priming and bagging unless carefully watched. It was possible to keep the sludge out of the boilers by frequent cleaning and blowing off every two or three hours.

If the facilities for softening are good, there should be no reason why mine water could not be used continuously with good success for feed-water purposes. For instance, a small sand filter installed in the case cited would have been a great help in removing the temporary hardness ($CaCO_3$) remaining in the softened water, which was not removed by sedimentation in the cistern; or another settling tank, the size of the one used, would have been beneficial, since it would have permitted the use of completely settled water.

Cost of Treatment

The cost of treatment will be considered under two heads—(a) cost of neutralizing with lime and (b) cost of softening with soda ash for boilers and house use.

Lime is usually figured to cost ¼c. per lb., or about $5 a ton delivered. Thus the chemical cost for neutralizing one-half to three-fourths of a million gallons of mine water daily is approximately $15, to which must be added the labor of stirring it in. Two shifts of men may be necessary. If there are available limestone and fuel in the immediate vicinity, it will pay the operator to burn the lime himself, saving freight.

In the examples cited throughout this article the cost of neutralizing would have to be based on the water used for the boilers and houses as well as for the ovens. From the preceding tables, it will be seen that almost as much was required for the former as for the latter. Had there been an available fresh-water supply for the boilers, the cost of neutralizing would have been comparatively small. Approximately 2½ tons of lime would have been required per day. The total cost for oven water would probably never exceed 2c. per ton of coke.

Soda ash is usually figured at 1c. per lb. delivered. As stated previously, from 3,000 to 4,000 lb. was required daily to furnish a supply of softened water to the boilers and houses. To this cost must be added the labor of introducing it. In round numbers, to soften mine water will cost in the neighborhood of 4c. per ton of coke, under average conditions.

As a general proposition, it would appear that mine water can be neutralized and softened at a cost of from 5c. to 7c. per ton of coke produced, which includes the cost of the chemicals and the labor for introducing them. The cost of installation is not figured in. It usually does not amount to much, if only dams across streams have to be constructed.

The chief thought in presenting the facts enumerated above is to point out the way to other operators who have experienced inconvenience on account of scarcity of water during droughts. It has been the intention to describe the methods and chemicals in such a manner that the scheme can be profitably followed by others. The use of treated mine water for industrial purposes certainly ought to prove more economical than shutting down the plant or hauling in fresh water in tank cars, as has been the practice in the past.

⁂

Extracts from a Superintendent's Diary

Today has been one of those days when everything seems to have gone wrong. Several times during the day I was on the verge of pulling down my rolltop and going home in disgust, but I did not really do that until about 10 minutes before quitting time; then I pulled it down with a slam and went home in a great huff. Had I known what awaited me there I probably would have loitered by the wayside instead of hurrying as I did, but fate has a way of letting things take their course without troubling itself with friendly premonitions.

Arriving home, I jerked open the front door with a wrench that made the hinges groan; and lo and behold, just inside stood my wife awaiting my arrival. My troubles were only beginning.

I am fully aware of the fact that life in a mining camp as wife of the superintendent carries with it for any woman experiences that make the heart bleed, but it is only on rare occasions that I stop to consider that the conduct of the superintendent himself is intimately connected with many of the wife's heartaches, especially the certain wife about whom I am best qualified to speak.

Most of the day I had been so absorbed in my own affairs that I had not given my wife's affairs a thought, and being brought thus suddenly face to face with her, my thinking apparatus seemed to snap; my tongue became useless, and I stood staring at her with such a simple expression on my face that she completely lost control of herself forthwith.

Now that the storm has passed and I have escaped to the quiet of my room to set down on paper my recollection of it, it is hard to realize that it was so serious after all; in fact, part of it seems really ridiculous, especially the stage setting. We never did close the front door, and any of the neighbors who happened to pass must have taken in the speaking part of the entire performance at least.

The tongue lashing that I had to submit to must have lasted about 15 minutes, and in that time my wife crowded a review of hardships endured reaching back over all the years spent in mining villages. Then, getting down to present tense, she heaped coals of fire on my head by recalling that I had completely forgotten all of the orders she had given me that morning, and as a result her sister would not be with us on the morrow, the new Sunday school literature would not arrive in time for next Sunday's use, nor would my wife's letter on "Women's Suffrage" reach her club president in time to be edited and published on the Women's Page of the Sunday edition of the metropolitan daily.

And the end was not yet. It was bad enough to be subjected to all kinds of inconveniences that were chargeable to forgetfulness, for they might be forgiven. But how could one overlook indifference and neglect. The idea of a man taking a woman away from her friends and kindred to an isolated community where all of the dreams of her youth had to be smothered, and then allowing her image to get out of his thoughts for an entire day. Surely nothing more terrible could be imagined.

It will be several days before normal peace and quiet will be restored in our household, and in the meantime I won't overlook any instructions because I won't be intrusted with any.

⁂

Estimated Fuel Consumption of New York City in 1916

The Board of Aldermen of New York City is conducting hearings now on the budget for 1916. The tentative budget has already been passed by the Board of Estimate and Apportionment and is now before the Board of Aldermen for its consideration. The following tabulation shows the tentative appropriation to the various city departments for "fuel" for next year and the value of the coal consumed by the same departments from June 30, 1914, to June 30, 1915:

Department	1916	1915
President, Borough of Manhattan	$77,980.00	$76,224.59
President, Borough of the Bronx	6,300.00	8,773.43
President, Borough of Brooklyn	63,746.00	66,448.20
President, Borough of Queens	24,762.70	16,448.20
President, Borough of Richmond	6,907.00	3,583.51
Board of Education....................	553,659.17	625,986.17
College of the City of New York........	18,291.00	20,321.31
Hunter College	1,598.00	2,399.37
New York Public Library..............	13,000.00	15,203.76
Brooklyn Public Library..............	7,298.00	9,331.40
Queens Public Library.................	1,674.00	1,854.96
Parks, Manhattan and Richmond........	13,005.00	14,951.54
Jumel Mansion	225.00	210.60
Metropolitan Museum of Art...........	11,818.84	11,274.46
New York Aquarium..................	4,500.00	4,458.41
American Museum of Natural History...	2,940.00	2,982.00
Parks, the Bronx......................	4,736.36	5,111.35
New York Botanical Garden...........	10,000.75	11,349.85
New York Zoölogical Garden...........	9,600.00	10,270.14
Parks, Brooklyn	11,100.00	8,041.66
Brooklyn Museum of Arts and Sciences..	6,500.00	6,988.94
Children's Museum, Brooklyn...........	375.00	429.00
Botanical Garden and Arboretum......	1,575.00	1,555.65
Parks, Queens	2,588.00	2,735.11
Staten Island Assn. of Arts and Sciences	150.00	148.50
Police Department	44,305.00	54,570.32
Fire Department	148,285.00	129,108.72
Armory Board	18,296.00	17,500.00
Department of Health.................	75,660.00	88,217.88
Public Charities	243,694.00	271,617.26
Bellevue and Allied Hospitals..........	88,730.00	85,278.63
Water-Supply, Gas and Electricity.....	154,840.00	144,176.00
Street Cleaning	9,033.38	8,808.97
Correction	75,000.00	85,293.52
Department of Bridges................	1,900.00	11,024.47
Docks and Ferries.....................	10,000.60	268,628.18
Sheriff, New York County.............	650.00	721.80
Supreme Court, Appellate Division Court House	1,500.00	1,511.25
Sheriff, Richmond County.............	1,400.00	1,361.00

The Board of Education in its estimate for the year 1916 asks for $553,659.17 with which to buy 116,996 gross tons of coal. In the year ending June 30, 1915, the estimate shows that 112,957 tons of coal was consumed, at a value of $625,986.17. The board also asked for an appropriation of $70,000 to provide for installations for economizing fuel in 70 buildings.

The tentative budget also contains an appropriation of $270,120 for the Department of Docks and Ferries "to be available only for the purpose of making changes on boats affecting the method of firing boilers or for the purchase of fuel for boats and terminals and to provide salaries of stokers employed pending the changes to be made in the boats and terminals."

⁂

Don't ever forget that the man who is asking a small favor today may be the one you will be looking to for aid tomorrow.

A Southern Indiana Washery

By E. P. Stewart*

SYNOPSIS—Abnormally wet conditions and a fireclay floor render the small sizes of coal produced too dirty to be marketable. They are consequently carefully washed and screened before being shipped.

The Ayrshire Coal Co., located at Oakland City, in the southern Indiana field, has recently put in successful operation a modern coal washing and screening plant, designed to carefully prepare into marketable sizes its 2¼-in. screenings. This installation has been made at the company's No. 7 mine, situated at Ayrshire, by the Roberts & Schaefer Co., of Chicago.

The coal bed worked lies close to the surface, resulting in abnormally wet mining conditions. As the coal is undercut by machines and the floor is fireclay, naturally the finer sizes produced contain a great deal of this material. This results in screenings rather difficult to market, especially so in certain seasons of the year. The lump and egg sizes produced are remarkably clean and meet a ready sale, but production of these sizes has been limited because of the difficulty in marketing the slack.

To remedy this condition, a Stewart washer installation was decided upon, with the result that now four sizes of washed coal are produced from the former screenings. The refuse remaining amounts to from 6 to 8 per cent. of the raw screenings and consists of fireclay, slate partings, sulphur and heavy high-ash bone coal. This washed coal is carefully sized.

Chestnut, pea and slack coal are produced in practically equal amounts. There are about two cars of each of these to one of nut coal. The nut coal is the most valuable size and is sold for domestic purposes. The other sizes are used as steam coals and command good prices. Pea and slack sizes are sold for use with stokers.

The washing and spraying process to which the coal is subjected entirely removes the fireclay, leaving the product clean and bright. This coal finds a ready market in competition with Illinois washed coal, and its preparation has brought about the steady operation of the company's mine. A brief description of the plant follows:

The slack is conveyed from the tipple shaker screens to an unwashed-coal storage bin having a capacity of 250 tons. From this bin the material is fed by a screw conveyor to a short elevator, which delivers to one large size Stewart jig. Refuse produced by the washing process is delivered into a small bin and from thence to a refuse car running on a long inclined trestle to the waste pile. The washed coal is settled in a large tank and elevated to the washed-coal sizing screens, located above a 250-ton capacity washed-coal storage bin, divided into four compartments. These screens produce four perfect sizes of washed coal, each size being delivered to its compartment in the storage bin. The sizes are: Through 2¼-in. and over 1¾-in., or nut coal; through 1¾-in. and over 1¼-in., or chestnut; through 1¼-in. and over ½-in., or pea coal; through ½-in., or slack coal.

Each size of coal is thoroughly sprayed and fine coal and fireclay thus removed.

COAL WASHERY OF AYRSHIRE COAL CO. IN INDIANA

---

*Chicago, Ill.

The screens are supported by flexible wooden hangers and are driven by wooden connecting-rods from the shaker shaft.

The entire operation requires from 60 to 70 hp. The main washer and screening equipment is driven by a 50-hp. motor. There are two 10-hp. motors driving raw-coal conveyors which transport screenings from tipple to washer. The labor required for operating the plant is usually three men—one at the jig, one looking after machinery in general and oiling and one on the cars loading coal. With the exception of the jig operator there has been no increase in the company's payroll. The cost of washing, taking everything into consideration including power, interest, depreciation, labor, repairs, etc., is approximately 10c. per ton. The cost of the plant was a little under $25,000.

The plant is designed to have a capacity of 45 tons per hr. of unwashed screenings. It has, however, steadily handled upward of 55 tons per hr. The entire equipment and all structures are well-built, and the plant should give satisfactory service for many years.

⁂

Concrete Arches Built Without Wooden Centers

The Clearfield Bituminous Coal Corporation builds small concrete arches without the use of wooden centers. First a stiffened metal lath, such as Self-Centering or Hy-rib, is bent into the form of the arch and supported in place. Then a layer of concrete about 1 in. thick is applied to the upper side. This is allowed to set, and this thin arch of metal lath and concrete constitutes the center of the concrete arch and becomes a part of it. The arch can be finished on the under side by applying a thin layer of concrete with a trowel.

⁂

A Coal-Arch Roof Support

Probably no person connected with the mining of coal is more keenly alive to the difficulties and dangers which surround the daily life of the miner than is the fireboss. It is no surprise therefore, especially to those who know the man, to learn that an important improvement in the method of mining coal has been proposed by Joseph Weatherly, fireboss at the mines of the Consolidated Indiana Coal Co., of Sullivan, Ind.

Consideration of the safety of men and machinery and of the problems of ventilation arising from the resistance to the flow of air offered by irregularities of roof and rib forces the practical mine man to a study of methods of supporting the roof of entries and aircourses. The ideal condition would probably be achieved by a semicircular brick arch, but the cost of such construction puts it entirely out of the question.

Mr. Weatherly has devised a method of roof support using such an arch, not of brick, however, but of coal.

By this system the coal is overcut by an adaptation of the top-cutting mining machine, arranged to form a curved kerf at the elevation of the roof. When the coal below this kerf is removed, that above it is left unshattered and forms a roof-supporting arch of sufficient depth at the ribs to support the overlying stratum and with only enough thickness at the middle to protect the slate from air slacking. This not only produces an ideal entry, having a smooth, safe roof, well-adapted to the economical ventilation of the mine, but effects a great economy in the amount of coal sacrificed to the support of the roof.

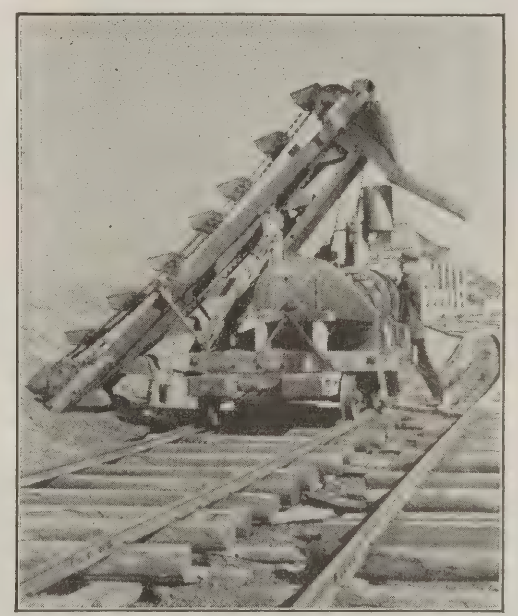
Mr. Weatherly has applied for patents to cover this method of roof support and has arranged with the Jeffrey Manufacturing Co., of Columbus, Ohio, for the manufacture of machines to carry out his system.

⁂

Gasoline Coal Loader

Some time ago the railroads hauling coal out of the Lehigh district made such changes in their stocking arrangements at tidewater that the G. B. Markle Co. found it necessary to stock coal to some extent at the mines. This firm did not wish to make a large investment in equipment and therefore devised means to do the work so far as possible with the machinery on hand.

To reload the coal from the stockpiles a loader driven by a gasoline engine was built. This consists of a chain elevator carried on a boom about 15 ft. long which is hinged at the top. The lower end is raised or lowered by screws on either side operated by bevel gears on a shaft turned by a crank. This boom is made of wood, with the outside faces of the long timbers covered with sheet steel. The shaft at the lower end is adjustable to take up slack in the chain. The whole machine is set on a wood frame and mounted on a mine-car truck.



THE LOADER IN POSITION AT THE STOCKPILE

The loader is driven by a gasoline engine of about 5 hp. There is one reduction by gears and another by the sprocket-chain drive. The machine loads per hour from 10 to 12 mine cars holding 5 tons of coal, the average being about 10 cars. It uses 6 gal. of gasoline in a 9-hr. day.

To keep spilled coal out of the machinery a second chute has been put on. This catches pieces of coal which do not get into the loading chute and carries them back to the stockpile.

⁂

Don't Use Long Words when you write or talk. Short words are best, for they are clear and plain and are known by all. We don't have to think much when we hear or read short words, and that is what we all want. We don't like to think when we don't have to. We like ease. Most great men are great in that they know how to make things plain.

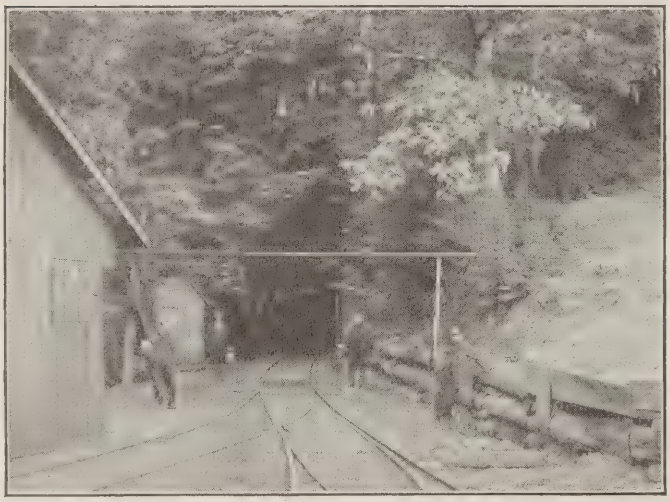
Accident Near Coaldale, Penn.

SYNOPSIS—Details of the rescue of nine men from Foster's Tunnel, near Coaldale, after an entombment of over six days. The men were blindfolded as they left the mine to ease their eyes and avoid undue excitement.

A break occurred in Foster's Tunnel, near Coaldale, Penn., on Sept. 27, at about 11:30 a.m. As a result of the caving of chute No. 24, East Mammoth, bottom split, 11 men were entombed, two of whom were rescued after a 22-hr. imprisonment, while the other nine were entombed for six days and five hours, with no food except that which remained in the dinner pails of six of the men who were fortunate enough to have them practically within their grasp when the break occurred.

Two of the men were working in a slant chute driven eastward off No. 24 straight chute, and the break occurred at the face of this slant working. The men had a few moments' warning and were able to run down the slant chute, but before they could climb up the straight chute the water had risen to their hips. They were able to pass from this point through a crosscut to another chute, where they remained for 22 hr., until the rescue party found them.

The air and water were driven so forcibly by the action of the cave that the sides of chutes Nos. 24, 23 and 22 were washed out, and the water carried rocks, coal, dirt and timbers into the gangway, filling it from chute No. 2 to chute No. 19, to a depth of from 2 to 6 ft. From chute No. 19 to chute No. 26, the gangway was entirely blocked with the timbers and material, and these were wedged in so tightly that they held the water behind them.



MOUTH OF FOSTER'S TUNNEL

Men Shut Off by Cave Climb into Safety

When the mine cave occurred, a loader, driver, chuteman and switch boy were unloading timber in the gangway in the vicinity of chute No. 29, three men were working at the face of the gangway, and two other men were working in chute No. 29. Upon hearing the fall and rushing wind, they hastened to chute No. 26; but finding the airway, or "monkey," completely blocked, making their escape impossible, the nine men climbed into chute No. 27—the longest chute in the workings—and remained there until found by the rescue party.

Between chutes Nos. 26 and 27 the vein had entirely pinched out, and the airway was being driven outward from chute No. 27 to chute No. 26, there still remaining but 6 ft. to be driven. It was due to this fact that the men were protected from the blackdamp which later found its way into chutes Nos. 26 and 25. From chute No. 26 inward the water in the gangway steadily rose until it was above the collars, thus making a water-seal at the bottom of chute No. 27.

When the men were found by the rescue party, their physical condition was better than expected, although they were suffering from hunger and the numbness due to the wetting of their clothing. A light had been kept burning for about half of the time, or until their supply of paraffin ("Sunshine") had become exhausted.

The rescue party was composed of about 300 men, who worked in three shifts. While the débris was being cleaned up from chutes Nos. 2 to 19, so that mine cars could be operated, a small opening about 4 ft. square was being advanced from No. 19 chute. At chute No. 20 two steel mine cars were found jammed in with other wreckage, and these had to be cut apart with oxyacetylene burners. The water was working its way through the débris in considerable volume, and 3-in. pipes were driven through the rubbish in order to permit the rescuers to tap the water. Two electric pumps were used, and later two additional air pumps were installed to keep the water away from the rescuers at the face. Electric lights were installed wherever the rescuers worked, and an additional compressed-air line was laid to operate drills and to improve the ventilation.

Reopened Airway with Bucket Brigade

The airway, or "monkey," 30 ft. above the gangway, was also entirely closed to chute No. 19, and was reopened with great difficulty. It was necessary to handle the material in water buckets, at times more than 50 men being employed on a shift passing these buckets from one to the other. In addition to this, a crosscut was driven from the top of chute No. 17 to chute No. 22, about 200 ft. above the gangway, in the hope that the upper portions of some of the chutes were open and that it would be possible to get down into them and find a way to the men entombed.

When chute No. 25 had been reached through the airway, a heavy body of blackdamp was met, which had to be removed by compressed air conducted to this point through 500 ft. of 2½-in. fire hose. After the blackdamp was removed, it was possible to travel down chute No. 26, which was partly filled with débris, and it was found that the water was standing in the gangway as high as the collars. During the next 8 hr. the depth of this water was reduced by about 3 ft., and several of the rescuemen traveled through the water from chute to chute to make a search.

As soon as the entombed men were found in chute No. 27, a platform was quickly constructed along the legs of the gangway timber sets. The men were assisted down No. 27 chute to this platform, taken up chute No. 26, and then outward through the airway to chute No. 19, about ½ hr. being consumed in transferring the men in their weakened condition through this route.

Careful Treatment of Rescued Men

The entombed men were given stimulants in chute No. 27 before they were moved and again as soon as they reached the gangway at the foot of chute No. 19. All the time the men were entombed several doctors were in attendance to render first aid whenever needed. There was also a first-aid and helmet corps of trained employees in continual attendance, who were supplied with lungmotors, pulmotors and all the medical equipment that could possibly be required. The stimulants were hot, clear coffee, and only small portions were administered at one time.

Not a word of the rescue had been allowed to reach the outside world. Consequently the public did not know that the men had been reached until the first man appeared at the mine opening on a stretcher supported by willing helpers. The assemblage of about 5,000 people at the tunnel mouth had no notice that something unusual was about to happen until the ambulances arrived. This was only a few minutes before the appearance of the rescued men at the tunnel mouth. These men had been covered with blankets, and gauze had been placed over their eyes to prevent the light from affecting their sight and also that they might not become unduly excited by the presence of the spectators.

RESCUED MEN LEAVING THE PANTHER CREEK VALLEY HOSPITAL

Reading from left to right: Top row—Joe Lagonis, Michael Cutodi, Peter Lahonnick. Second row—Charles Matokas, John McAndrew, Domnic Hotcheck, William Watkins. Bottom row—John Bonner, Joseph Murphy, Elmer Herring, George Hollywood

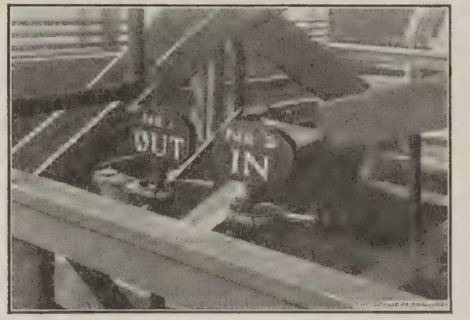
Ropes had been drawn around the tunnel mouth to prevent the people from getting within a radius of 125 ft. of the entrance; and when the first of the men was brought to the outside hardly a murmur could be heard, and this quietness continued until the last man had been taken away. The transference of the men was performed with all the silence, precision and decorum of a great funeral, the removal being witnessed quietly by the great crowd, as everyone realized that any outcry would have a dangerous effect on the men.

Despite the feeling that the rescue was the great event in the history of the Lehigh Coal and Navigation Co.'s mines, the interested spectators, in order to meet the urgent needs of the victims, restrained their ardor in a most commendable manner. The rescued men were at once removed to the State Hospital at Coaldale, where they were detained for about a week, until Dr. Shifferstine, the superintendent, decided they had fully recovered from the effects of exposure.

Safety in Loading Coal

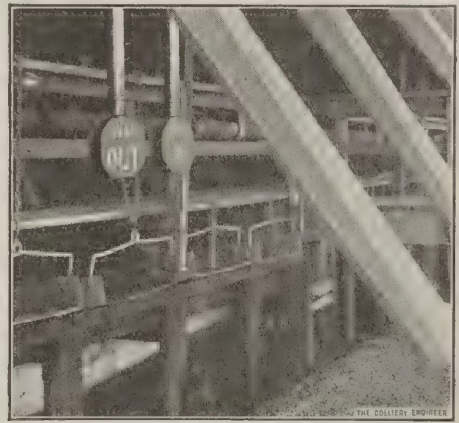
In anthracite breakers large hoppers or pockets are constructed to receive the different sizes of coal. The railroad cars are then loaded direct from these pockets.

To prevent a man who for any reason is down in a pocket from being drawn down by the action of coal being loaded from that pocket, the Susquehanna Coal Co. has adopted the scheme shown in the illustration.



INDICATORS ABOVE BINS

The upper photograph illustrates the top of the pocket. The one on the left has no one in it and the sign reads "Out." Should a workman have occasion to go down into the pocket, he turns the signal by the handle to the "In" position. These signals are connected to the ones at the chutes below by a continuous shaft or pipe. With these signals in use, coal is only drawn from those pockets registering "Out."



INDICATORS BELOW BINS

⁂

A Particularly Despicable Form of Theft is practiced in coal mines both here and in Great Britain. In the mines of both countries it is the custom of the miners to attach numbers to the full cars for identification purposes on payday, payment of course being made according to the amount of coal got. These numbers have been known to be changed, with the result that scamps disinclined to work themselves have got the credit and the cash due to the hard-working miner. The latter on searching the surface has often been puzzled to know how he only filled four cars when he himself had counted, say, five, but the evidence of the number is final until the thief is caught red-handed.

Superior Coal Co.'s Mines

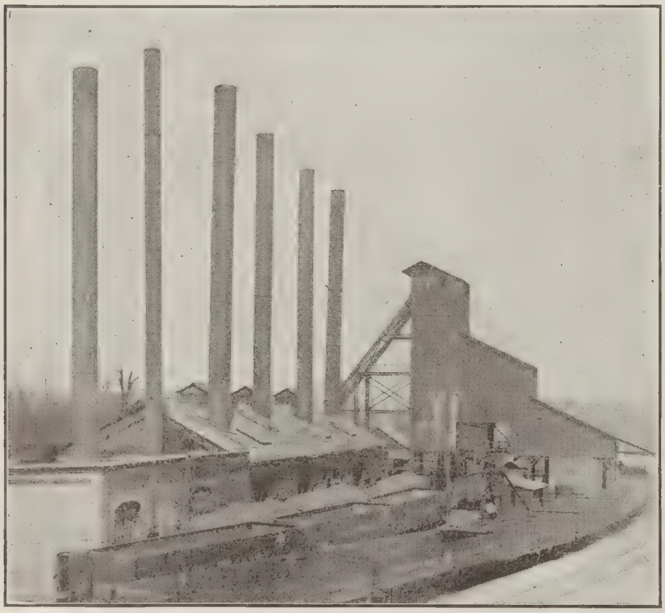
The Superior Coal Co. of Illinois has three of the largest coal-producing mines in that state and one of the largest coal washers in the country. These mines are numbered 1, 2 and 3 and are located about 45 mi. northeast of St. Louis, on the Chicago & Northeastern R.R., to which they are subsidiary.

The mines, which were opened about 10 years ago, are similar in nearly every particular. The method of mining is the two-entry room-and-pillar system. The rooms are driven 30 ft. wide on 50 ft. centers. The entries are driven 21 ft. wide on 60 ft. centers, where they are intended for main ventilating and haulage roads. Where they are butt entries they are driven 50 ft. apart. The seam mined is No. 6 and it averages 7½ ft. in thickness.

No. 1 mine operated only 202 days in the year 1914 and produced 748,463 tons of coal, thus making a daily average of 3,688 tons per day. Its record is 4,530 tons for a single 8-hr. shift. The mine is equipped with two 12-ton Jeffrey locomotives on one side of the workings and one 12-ton and a 6-ton Jeffrey on the other side. None of these do any gathering. A 6-ton Goodman gathering locomotive is used to take the coal from the men in the rooms and place it on a parting for the big locomotives to bring to the shaft bottom. About 600 men and 30 mules are employed. The mine has 90 entries under development and 230 rooms working.

LARGER RUN THAN ANY OTHER MINE IN STATE

No. 2 mine operated 208 days in 1914 and produced 843,820 tons, making a daily average of 4,049 tons. Its record run was 5,133 tons in an 8-hr. shift, which has not been exceeded by any other shaft in the state. On one side of this mine two 12-ton Jeffrey locomotives are in use, and on the other side one 15-ton and a 6-ton Jeffrey are installed. Thus four locomotives are used to bring cars to the bottom. There is also a gathering locomotive of Jeffrey make and 27 mules which together gather the coal to the partings. The mine employs on an average 675 men. It has 88 entries and 250 rooms.



POWER HOUSE AND TIPPLE OF SUPERIOR COAL CO. AT SAWYERVILLE, ILL.

No. 3 mine only operated 195 days. It produced in that time 785,508 tons, making a daily average of 4,011 tons. The maximum output hoisted in a day of 8 hr. was 5,116 tons. The mine has two 15-ton Jeffrey locomotives, one on each side of the workings, which bring the coal from the inside partings to the foot of the shaft. A 6-ton Jeffrey locomotive is used for relaying coal from several small partings. Two 5-ton Goodman locomotives gather the coal from the miners in their rooms and bring it out to a large parting, from which it is hauled to the shaft parting by one of the big locomotives. In the work of gathering, the Goodman units are aided by 29 mules. The mine employs on an average 680 men. It has 86 entries and 250 rooms.

SUPERIOR COAL CO.'S WASHERY, ONE OF THE LARGEST IN ILLINOIS

The coal in these mines is undermined by shortwall breast machines and punchers, 107 in all. Jeffrey, Ingersoll-Rand, Sullivan and Harrison types of cutting machines are all represented. Near each shaft bottom a switchboard is located with four switches, one for the machines and one for the locomotives on each side of the shaft. The feed wire for the machines is on the main roads with a separate switch for each entry.

WASHER CAN HANDLE 3,000 TONS PER DAY

Only one-half of the washer was operated last year. A daily average of 1,359 tons of washer coal per day was maintained. The record is 1,530 tons in 8 hr. The building was erected and equipped by the American Washer Co. and, as has been said, is the largest in the United States. There are eight jigs of the Stewart type. The screenings are unloaded into the bins over the jigs by a combination spiral-drag and bucket-elevator system.

The mines were opened to produce only 2,500 tons per day, but by building up an excellent organization the remarkable excess over expected capacity has been reached. John P. Reese is general superintendent, and he is assisted in his work by John H. Ross, superintendent, and P. H. Shanahan, assistant superintendent.

⁂

The Best Raw Coal in Brazil contains about 35 per cent. of ash, of which 6 per cent. is sulphur, according to I. C. White, of Morgantown, W. Va., who was chief of the Brazilian Coal Commission from 1904 to 1906. A cargo of coal shipped to Kalk, Germany, was crushed and washed and yielded 33 per cent. of briquetting coal containing only 10 to 12 per cent. of ash (of which 1 per cent. was sulphur) and 42 per cent. of slack coal, with 25 per cent. of ash and low in sulphur. So only about one-third of this coal could be converted into coke of a fair quality. The coal is located 1,000 mi. away from the iron-ore and limestone deposits of Brazil, and the country to be traversed is extremely difficult, there being a great wall of granite 2,000 to 3,000 ft. high to be surmounted by the use of deep cuts and tunnels.

Work Accomplished by the Illinois Miners' and Mechanics' Institutes

SYNOPSIS—The following address, delivered by R. Y. Williams, director of the Institutes before their abandonment, gives a brief but succinct outline of the results attained in a year and a half since the organization was formed. The address was made before the Mine Inspectors' Institute of the United States of America, at its eighth annual meeting, St. Louis, Mo., June 8-11, 1915.

It is my privilege during the 10 minutes which has been allotted to me, to address you on the new educational endeavor that was recently begun in Illinois by the Miners' and Mechanics' Institutes. It is a pleasure for me to address you on this subject because the mine inspector, probably more than any other individual, spends the greater part of his time in the consideration of mining methods that will bring about the prevention of accidents and the conservation of natural and created resources. It is my hope that you will have suggestions to make that will assist me in bringing about the maximum of efficiency in this new work.

Before an audience of this kind, it is hardly necessary to draw attention to the need of educational work among coal-mine employees. Suffice it to say that the state, by legal enactment, requires applicants for the position of mine inspector, mine manager [foreman], mine examiner [fireboss] or hoisting engineer to have a certificate of competency certifying that the candidate has passed a combined written and oral examination given by the mining board. Every miner, also, must have a certificate issued by the miners' examining board, based on an oral examination to determine his qualifications as a practical miner. It seems only consistent, therefore, that the state should furnish the means whereby miners may obtain the education necessary to pass such examinations. If those who are to be responsible for the acts of the men under them are required to have certain technical qualifications, it is evident that the desideratum would be accomplished if the men at the face had similar technical ability.

The statement is often made that one of the necessary things about a mine is discipline. In this connection discipline means "training resulting from a course of study in coal mining designed to qualify employees for harmonious and effective action." If all the records were known it would be found that "familiarity" instead of "breeding contempt" breeds efficiency.

Attitude of State Mine Inspectors Toward Educational Work

An inspector from West Virginia has said "education is the best preventative of mine accidents" and an Oklahoma inspector has thought that "it should be made a criminal offence to employ inexperienced men." In the printed proceedings of the past meetings of the Mine Inspectors' Institute, it is clearly evident that the mine inspectors of the United States believe that the general causes of mine accidents are ignorance and carelessness, and that the remedies for this are education, discipline and prosecution.

In Illinois, an appropriation of $15,000 per annum became available Jan. 1, 1914, for the promotion of the technical efficiency of all persons working in and about the mines of the state. In order that this appropriation might be used to assist in removing the general causes of mine accidents, a careful preliminary study was made of the specific causes of those accidents that appeared to result from ignorance and carelessness. In the following table there are given the ten specific causes of such accidents, in the mines of Illinois, during 1913 and 1914. The relative importance of these causes is shown by the proportion of accidents they produce and the educational courses in the Miners' and Mechanics' Institutes are designed to cover these subjects.

What the Course Includes

As given by the Institutes, the educational courses named below include a detailed study of the proper methods of procedure in each case; a consideration of the wrong ways of doing things, which invite accidents; and a statement of the state mining law governing the point in question. A man who is faithful to the work of the night schools is able to free himself from the blight of ignorance and to cope successfully with the dangers of mining.

MINE ACCIDENTS IN ILLINOIS, 1913 AND 1914

Causes of Accidents	Number Killed	Percentage of Fatalities	Educational Courses Methods of Mining Coal
Falls of roof and coal........	168	50.3	Geology Surveying
Cars, motors and mules......	92	27.5	Haulage Drainage
Gas........................	16	4.8	Mine Gases and Safety Lamps Ventilation Fire Protection
Blasting and explosives.......	16	4.8	Explosives
Shafts, cages, etc............	14	4.2	Hoisting Surface Plant
Machinery, R.R. cars, etc....	13	3.9	Coal as Fuel
Electrocution...............	12	3.6	Electricity applied to mining
Drowned....................	2	0.6	Drainage
Steam......................	1	0.3	Steam
Total.....................	334	100.0	

The list of topics and the time devoted to each topic in the two-year course is as follows:

Group	Number of Course	Subject	Number of Evening Sessions
A	1	Methods of mining	10
	2	Timbering	5
	3	Ventilation	8
B	4	Mine Gases and Safety Lamps	5
	5	Special underground rooms	2
C	6	Geology	5
	7	Surveying	10
D	8	Coal, a fuel	5
	9	Surface plant	5
	10	Steam	5
E	11	Hoisting	7
	12	Haulage	8
F	13	Fire protection	5
	14	Electricity	10
G	15	Drainage	6
	16	Explosives	9
		Review	7
		Total...............	112

In order that the men who work hard at the coal face in a mine during the day may not be discouraged by attempting too much study, it has been the plan at each town where classes have been organized to hold two meetings each week and to spend two hours at each meeting. By dividing the general subject of coal mining into 16 topics, and by allotting such time to each topic as will cause the complete course to extend over a period of two years, the Institutes have offered a plan by which men are able to continue full time at work, while obtaining the desired technical knowledge. In this way, the student increases his practical experience at the same time that he gains a knowledge of the theory of mining and he finds that both the practical and technical work are advantageous to him in the position of enlarged responsibility for which he is striving.

EQUIPMENT PURCHASED FOR THE WORK

In order that these courses may be of practical value to the men, a very complete equipment of apparatus and books has been purchased for the demonstration of the fundamental principles of chemistry, physics, mechanics and electricity as applied to mining, and in order that the men may become skilled in the use of safety lamps, surveying instruments, drafting appliances, hygrometers, water gages, dynamos, motors and electrical meters. The use of this equipment has met with a great deal of success in the conduct of the courses.

The towns at which two-year courses have been inaugurated, the date of organization, the total number of evening sessions, and the attendance at each place, are as follows:

Towns	Counties	Date of Organization 1914-1915	Total Number of Evening Sessions	Attendance Average	Total
Belleville	St. Clair	March 18, 1914	77	16	1,246
Benton	Franklin	October 7, 1914	53	13	698
Carterville	Williamson	January 9, 1915	36	22	806
Centralia	Marion	October 7, 1914	39	21	826
Collinsville	Madison	April 2, 1914	84	24	2,042
Duquoin	Perry	March 29, 1915	10	22	219
Gillespie	Macoupin	October 9, 1914	61	25	1,546
Harrisburg	Saline	March 23, 1914	101	16	1,652
Herrin	Williamson	March 26, 1914	134	20	2,745
O'Fallon	St. Clair	February 6, 1915	14	19	261
Pana	Christian	January 12, 1915	24	32	758
Pekin	Tazewell	October 1, 1914	33	13	422
Peoria	Peoria	October 1, 1914	64	23	1,436
Springfield	Sangamon	October 5, 1914	62	28	1,710
Staunton	Macoupin	May 4, 1914	85	28	2,343
Thayer	Sangamon	November 2, 1914	64	15	957
Troy	Madison	October 8, 1914	56	22	1,240
Worden	Madison	January 21, 1915	34	6	207
Total					21,114

The total enrollment during the year was 1,432 students.

Arithmetic is a study in which a large majority of the men in the classes are interested; during the past year nearly one-third of the time of each lecture has been devoted to a consideration of this subject, and in some towns separate classes have been organized to pay special attention to it. One student, who is 50 years of age, was unable at the time of enrolling in the class to perform simple addition. At the completion of the first course he was able to work in fractions. Because of the large amount of attention that must be given to arithmetic, it has been found that the classes in many towns require a period in excess of 2 years to complete the entire mining course.

COÖPERATION WITH PUBLIC SCHOOLS

This large number of night schools has been possible because of the coöperation of the Institutes with high and graded schools. Many public schools are located in districts where coal mines offer practically the only employment and where many of the pupils are looking forward to work in the mines as soon as the law will permit them to enter. Before the establishment of the Institutes, some high schools in these districts had requested assistance from the Department of Mining Engineering at the University of Illinois, but were unable to receive such help because of the lack of funds. Agreements have been made with a number of these schools by which the Illinois Miners' and Mechanics' Institutes offer evening classes for men who are employed during the day in the mines, in order that they may be fitted for more efficient service and more profitable employment.

The school boards have allowed the classes to meet without charge in the school buildings and also to use the chemical and physical equipment provided. In most cases, light, heat, and janitor service have also been provided free to the students.

The Institutes heartily acknowledge their indebtedness to the various school boards, superintendents and teachers who have thus coöperated in the organization and conduct of evening classes, and who have been coequal with the Institutes in bringing about local interest and in maintaining successful courses.

In addition to the work outlined above, the Institutes have held special meetings for the illustration of safe methods of mining coal. At twelve of these meetings the attendance was 7,905. The Institutes also have published 3 bulletins, 4 circulars, 3 instruction pamphlets and 1 annual report. They have held two six-weeks' short courses, at the University of Illinois. At the last short course, 28 men from the mines took the entire course in coal mining.

⁂

Outlook in Coal Mining

In the Oct. 9 and Oct. 16 issues of *Coal Age* we printed several columns of comments from prominent coal-mining people relative to the prospects for business in the coal industry this fall and winter. Additional opinions are here given:

ALABAMA	
W. D. Leake, Gen. Mgr., Caledonia Coal Co., Jasper	Good
ARKANSAS	
C. P. Wilson, Secy. and Treas., Harper Coal and Coke Co., Fort Smith	Much better than previous years
CANADA	
W. B. Christie, Red Deer Valley Coal Co., Ltd., Calgary, Alta	Extra good
COLORADO	
James E. Brooks, Pres., Brooks-Harrison Fuel Co., Louisville	Good
W. O. Sherman, Gen. Mgr., Baldy Coal Co., Trinidad	Improved
Louisville Coal and Land Co., Firestone	Fair
M. B. Nequhart, Denver	Good
ILLINOIS	
Silver Creek Colliery Co., Farmington	Good
KENTUCKY	
H. D. Parrish, Pres., Sturgeon Creek Coal Co., Beattyville	Excellent
MICHIGAN	
Jewett, Bigelow & Brooks, Detroit	Good
MISSOURI	
Grand River Coal Co., Cainsville	Very good. We have operated every day since Aug. 19, with prospects for running every day until spring.
C. B. Moore, Northern Central Coal Co., Higbee	Good
MONTANA	
George W. Wilson, Pres., Carbon Coal Co., Sand Coulee	Improved prospects
NORTH DAKOTA	
McClure Coal Co., Minot	The best in 5 yr.
PENNSYLVANIA	
Standard Coal Mining Co., Grove City	Good. Shortage of miners will make coal scarce
VIRGINIA	
Lee Long, Gen. Supt., Clinchfield Coal Corp., Dante	Good
WYOMING	
John Martin, Gen. Mgr., Bear River Coal Co., Evanston	Good. Wyoming has immense quantities of high-grade coal
H. S. Hopka, Gen. Mgr., Sheridan Coal Co., Dietz	About normal. A cold winter means big output

A Power-Driven Coal Auger

In the past the drilling of coal has been done mostly by hand, or more recently by portable electric or compressed-air augers. The hand method requires from 20 min. to ½ hr. to bore a hole of the ordinary depth, which means a considerable loss of the miner's time.

Portable machines, operated by either electricity or compressed air, have been introduced and are used to a certain extent. The operators of such machines are usually paid at a specified price per ton of coal produced or at a given rate of wages per day. Such augers will generally bore a hole in about 1½ min., and if the time of drilling were the only point to be considered, this type of machine would doubtless have been generally adopted long ago.

The amount which may be deducted from the coal loader for having the drilling done by power has been determined and agreed upon in various mining districts. The rates fixed are such that when the total expense is taken into consideration the reduction in cost of coal is at best small. It is therefore apparent that the only kind of power auger which will be of any considerable value must be of such construction that it can be operated with a small amount of labor and low cost for repairs. These results are claimed for an auger manufactured by the Fairmont Mining Machinery Co., of Fairmont, W. Va.

This auger is used in connection with an undercutting machine, and both are operated by the same motor. The time taken to drill a hole 7 ft. deep is about 1 min., while no time is consumed in moving the auger from place to place, since it is attached to and made a part of the machine and moves with it from room to room.

The only time to be paid for by the mine owner is that actually occupied by the machine runner in adjusting the auger and boring the hole. The flexibility of the auger, with the small number of working parts, enables the runner to adjust it quickly, and but little time is occupied in the entire operation of setting up the auger and boring the hole. The necessity for high rates of wages for this part of the work is accordingly overcome, and the mine owner may share the gain with the regular machine runner. This does not in any way change the relation of the loader to the mine owner, and the reduction provided for by the scale can be properly made, the same as is done in the case of the portable auger.

The auger is attached to the machine, but is so arranged that the hole may be placed wherever desired. The auger, frame and driving mechanism may be laid flat on the top of the motor when the cutting machine is being moved from place to place. The drilling may be done properly and the cutting machine moved without any appreciable loss of time on the part of the machine runner.

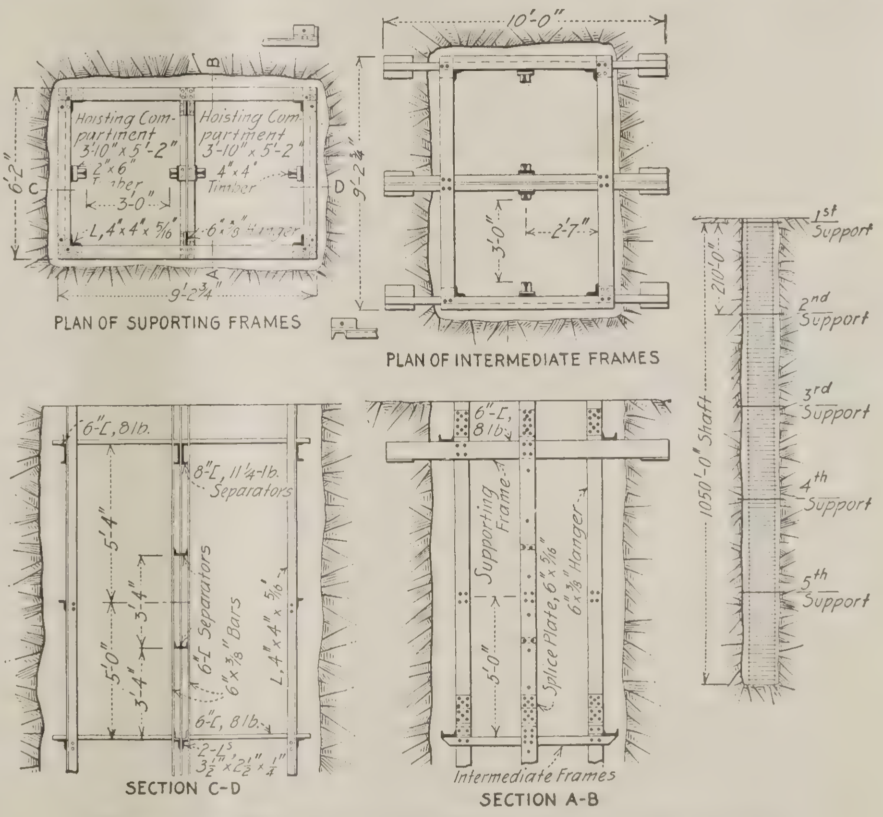
It has also been demonstrated that more coal is produced at each cutting when the machine runner does his own drilling than when the loader does this work. This in itself is a source of increased revenue to the machine runner and has proved to be one of the most important advantages in the adoption of the auger by the mine owner. It has been found also that a rate not to exceed ½c. per ton wholly compensates the machine runner for the time occupied in doing this drilling.

⁂

Shaft Timbering of Steel

R. H. Cromwell in the *School of Mines Quarterly* of Columbia University describes a steel shaft lining, and from his account the following is abstracted:

At the Los Ocotes copper mine in the State of Oaxaca, Mexico, an 800-ft. shaft was timbered with steel, the details of the shaft-set being shown in the accompanying sketch. Supporting, or bearer, sets made up of 8-in. steel channels were cemented into hitches cut in the side of the wall. These supporting sets were installed just below the collar and at 210-ft. intervals in the shaft. All the steel, before being placed, was painted with a mixture of coal-tar and turpentine. From the surface to the 600-ft. level, sets were put in 10 ft. apart. From the 600- to 800-ft. level, because the ground showed a tendency to cave, the sets were put in every 5 ft. The lagging of 2-in. planks was laid lengthwise between the sets.



DETAIL OF STEEL-SHAFT TIMBERING, LOS OCOTES MINE

For timbering this shaft about 73 tons of steel was required, costing approximately $100 United States currency per ton laid down at the mine. A steel gallows frame was erected containing 15 tons of steel, which cost about $140 United States currency per ton delivered on the ground. This is at the rate of 5c. and 7c. per lb. and does not include the cost of erection.

How Heat Affects Concrete

In the University of Illinois bulletin entitled "Influence of Temperature on the Strength of Concrete," A. B. McDaniel, assistant professor of engineering, reaches the following conclusions regarding his experiments with concrete:

1. Under uniform temperature conditions there was an increase of compressive strength with age within the limits of the tests. In no test was the concrete matured for more than 44 days, and in many of the tests no specimen was crushed after a period of 28 days. For any given temperature the rate of increase in strength declines as the specimen becomes older. For the specimens tested under normal and uniform hardening temperature conditions of from 60 deg. to 70 deg. F., the compressive strength of the concrete after 7, 14 and 21 days is approximately 50 per cent., 75 per cent. and 90 per cent. respectively of the strength attained after 28 days.

For low temperatures the percentage values are less, and for higher temperatures the percentages are higher.

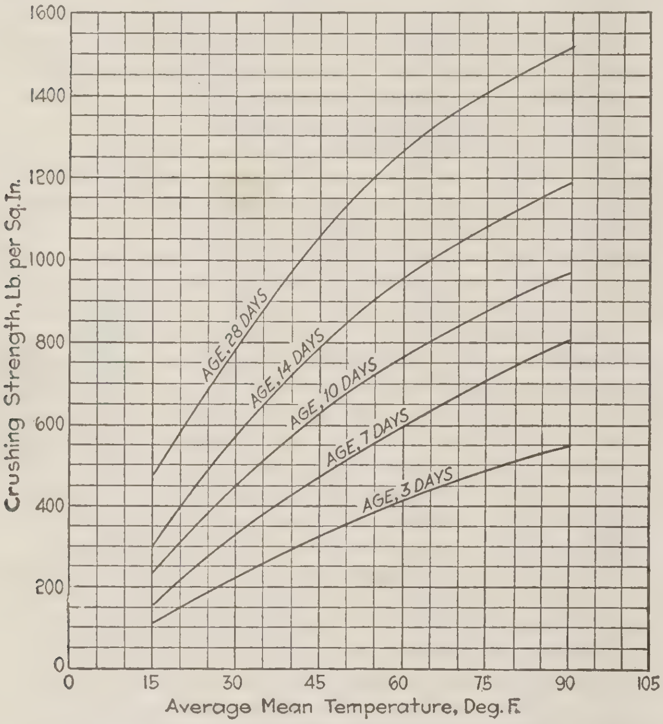


FIG. 1. RELATION OF STRENGTH TO TEMPERATURE FOR DIFFERENT AGES OF CONCRETE

The relation between the percentage values at the ages of 7, 14, 21 and 28 days is nearly the same for temperature conditions from 30 deg. to 70 deg. F. However, the values for the lower temperatures should be used with caution.

2. Concrete maintained at a temperature of 60 deg. to 70 deg. F. will at the age of one week have practically double the strength of the same material which is kept at a temperature of 32 deg. to 40 deg. F.

3. Figs. 1 and 2 may be used to determine the representative strength of concrete similar to that used in the tests for various temperature conditions and for ages up to 28 days. The concrete used in the tests consisted of 1 part cement, 2.2 parts sand and 3.6 parts broken stone by volume. It should be noted that in the investigation the specimens were stored at temperatures which were nearly uniform.

When there were a number of alternations above and below the freezing point, the specimens were seriously injured. In fact, in aging from 14 to 28 days under such conditions with a mean temperature of 27.1 deg. F., there appeared to be a loss of about 30 per cent. in compressive strength, and one of three concrete cylinders was so weak at the end of 28 days that its strength was only about 45 per cent. of that of a cylinder tested after 14 days.

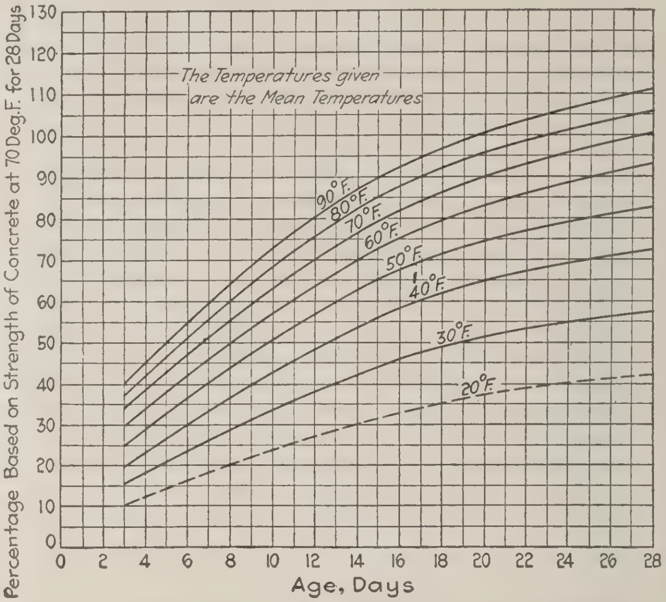

FIG. 2. PERCENTAGES OF STRENGTH FOR DIFFERENT TEMPERATURES

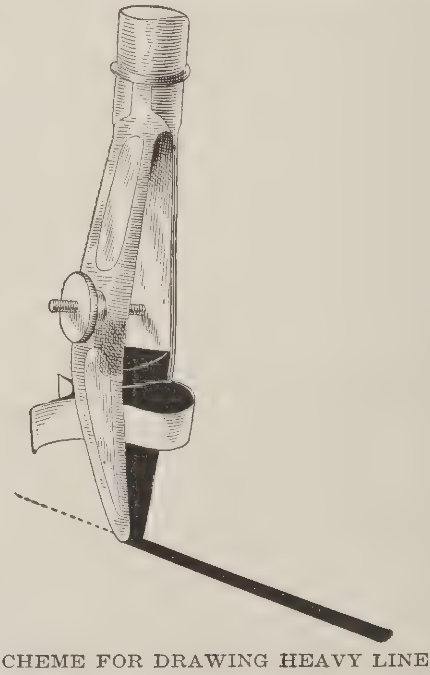
A Pen Kink for Draftsmen

It is often necessary in drafting to draw heavy lines. By placing a bent piece of drawing paper between the blades of a tracing pen, as shown in the illustration, the capillarity of the pen and the flowing friction of the ink can be increased, very heavy lines can be drawn, and the annoying blot at the end of a line can be avoided. The pen will also under these conditions convey more ink.—*Engineering and Mining Journal.*



SCHEME FOR DRAWING HEAVY LINES

New Safety Signal Indicator

A safety device to guard against an engineer's moving a cage until he has received signals from both the top and the bottom of a shaft has recently been invented by Bernard Reilly, a hoisting engineer of near Wilkes-Barre.

The first device along this line was patented by Mr. Reilly about seven years ago, at which time one was placed on an engine at the No. 3 shaft of the South Wilkes-Barre Colliery of the Lehigh & Wilkes-Barre Coal Co. It has been in constant operation since that time, and in the seven years there has not been an accident in the shaft caused by moving the cage without the proper signals.

Under the present system of signaling, an engineer does not move his engines until he receives a signal to do so from both the top and the bottom of the shaft. He is under a constant strain listening for the signals, and if both are rung at the same time he is left in doubt and must wait until they are repeated. Should he be deceived and move the cage thinking that both signals had been given when really only one had been given, an accident might readily result.

The Reilly indicator removes all this doubt by its positive operation. It is worked from the drum or engine, to which it is attached, and when the cage reaches the top a red disk appears, a bell rings and two indicator hands go to the top of the dial. These hands represent bells at the top and bottom of the shaft, and remain pointing to the red danger disk until the bells are rung.

One hand is operated by the bell at the bottom of the shaft, and when this signal is rung the hand drops to the safety position, but the other hand and the disk remain indicating danger until the second bell is rung, when the hand drops and the disk shows white. Thus the engineer can see at a glance whether one or both signals have been given.

Winter Meeting of Kentucky Mining Institute

The Kentucky Mining Institute will hold its winter meeting Dec. 3 and 4, 1915, at Lexington, Ky. On Friday afternoon at 2 o'clock in the Mining Building of the College of Mines and Metallurgy, State University of Kentucky, the following papers will be presented: "New Workmen's Compensation Bill," by K. U. Meguire, president of the Harlan Coal Mining Co., Coxton, Ky.; "Safety Plans in Kentucky Mines" (author unknown at present); "Experience with Fires in Mine No. 4 of the Stearns Coal and Lumber Co., Stearns, Ky.," by Joseph Cain, mine superintendent of the Stearns Coal and Lumber Co.; and "Systems of Coal Mining in Eastern Kentucky," by Prof. C. J. Norwood, dean of the College of Mines and Metallurgy, State University of Kentucky.

In the evening at 6:30 there will be a banquet in the main dining room of the Phœnix Hotel, to which the ladies are invited. Moving pictures of the Hazard coal field will be shown during the evening. On Saturday morning at 9 o'clock an automobile trip will be taken through the Blue Grass country of Kentucky. In the afternoon at 2 o'clock in the Mining Building the following papers will be read: "The Coals of Eastern Kentucky," by Frank Haas, of the Consolidation Coal Co., Fairmont, W. Va.; "The Future of Coal-Mining Plants from an Engineer's Standpoint," by O. G. Peterson, president of the Associated Engineering Co., Somerset, Ky.; "The Ohio Situation" (author unknown at present); and "Cost Accounting" (author unknown at present). On Saturday evening at 8:15 the members will attend the musical comedy, "When Dreams Come True."

The Price-Cutting War at Down East Points

There is no reason to suppose the price war for 1916 contracts on cars Boston has in any way subsided. Consumers who have not closed find themselves in favorable position to negotiate, and the opinion seems to be that the end is not yet. Within a week $3.30 has been quoted, so that prices have softened 30c. since the "campaign" began. Further instances have come to light where fair-sized contracts at points away from Mystic Wharf but accessible to steamers have been closed at 15@20c. less than for the current year. Certainly a larger tonnage has been sold for a farther period in advance than has been the case before. One result of the low prices for next year is a natural tendency of consumers to stock up rather less heavily this winter and rely on getting the full benefit of low prices to be effective Apr. 1. Should there be a marked shortage of steam coals at that time there would be some interesting developments.

Susquehanna Safety Button

The accompanying illustration shows the enameled button of the safety organization of the Susquehanna Coal Co. and the Lytle Coal Co. The reproduction is the exact size of the original. All letters and outlines are in gold. The outer belt is black, the next green and the horizontal space and inner circle white. The central cross is red. This button is given to members of the office and field forces interested in safety, rescue and first-aid work.

Telling Time with a Compass

It is commonly known that points of the compass can be determined by the use of a watch. By pointing the hour hand toward the sun, a bearing halfway between the hour hand and 12 o'clock on the watch is true south.

It is not generally known that time can be told by the compass with equal facility. Take the true azimuth or bearing of the sun and subtract from it 180 deg.; multiply the remainder by the fraction $^1/_{15}$, and the result will be the hours before or after 12 o'clock noon.—*Engineering and Mining Journal.*

⁂

Damages Recoverable for Personal Injury—For injury to a coal miner, caused by a gas explosion for which his employers were liable, where his sight and hearing were permanently impaired, $3,000 is not excessive recovery. (Kansas Supreme Court, Hartman vs. Dickinson, 148 Pacific Reporter, 743.)

⁂

Relation of Fireboss to Operator in Pennsylvania—So far as a fireboss discharges his statutory duties he acts as a state official and not as a representative of the operator. Hence, assurances of safety given by him to a miner are not binding upon the operator. But he may become the representative of the operator by performing duties beyond those required of him in an official capacity. (United States Circuit Court of Appeals, Second Circuit, Calausky vs. Lehigh Valley Coal Co., 222 Federal Reporter, 664.)

The Labor Situation

SYNOPSIS—The railroads decide that the poverty of the Ohio miners alone appeals to them and propose to raise ton-mile rates in Pennsylvania, where they are high, as much as in West Virginia, where they are low. More button strikes in the anthracite region. In Ohio the court resentences strikers for violating injunction.

Most of the Ohio coal miners are now back at work, and it is stated on good authority that not more than 5,000 out of the 40,000 miners in Ohio coal fields are now idle. Governor Willis has made a careful inquiry to determine if there is any probability that this year's calamitous stagnation will be repeated in the coming year.

According to reports made to him, the only large body of miners now idle are those who were formerly employed by the Sunday Creek Coal Co. in the Hocking Valley district, and these amount to about 4,000 men. Operators in general believe that the demands for coal from the big steel mills and plants that are making war munitions will prevent any depression in the coal business this winter.

The New York Coal Freight-Rate Conference

But while the war may bring temporary relief, there is need for some permanent improvement, which it is hoped will make operation always profitable and not dependent on abnormal conditions. This steady relief is expected from lowered freight rates.

It is stated that at a meeting of the traffic officials of coal-carrying roads in New York City it was decided to increase the rate on shipments of coal 15c. a ton when shipped from near-by states to points in Ohio, eastern Indiana and eastern Michigan. It is said that the new tariffs will be filed with the Interstate Commerce Commission at an early date. The filing of the tariffs is expected to start a bitter fight by operators in West Virginia and Kentucky against the establishment of the advanced rates.

At the New York meeting the following roads were represented by their presidents or vice-presidents: The Pennsylvania R.R., the Chesapeake & Ohio Ry., the Baltimore & Ohio R.R., the Norfolk and Western Ry., the Louisville & Nashville R.R., New York Central & Hudson River R.R. and the Pennsylvania Lines West of Pittsburgh. Banking interests which exercise a strong influence in some of those systems were also represented and the session had its strenuous moments.

Pittsburgh Freight Rates West to Be Increased

It seems that of the lines serving the West Virginia fields the Chesapeake & Ohio Ry. held out most vigorously against the proposed increase, in which the other lines had recently acquiesced. But President George W. Stevens finally yielded only on the condition that the Pennsylvania R.R. also increase its rates from the Pittsburgh district, a concession which the latter road is said to have made most reluctantly.

The men who participated in the conference explain that the advance is made to prevent the rates from coal mines in Ohio to consuming points in the state being lowered the same amount (15c. per ton) as the railroads now propose to raise them on coal from West Virginia.

Until the meeting it had not been intended to raise the rates on coal from Pennsylvania mines, but the maintenance of the old rate while the West Virginia rate was changed would have given Pennsylvania an advantage over West Virginia and Kentucky. Consequently as explained, the Chesapeake & Ohio Ry. refused to acquiesce in the increase unless the Pennsylvania R.R. also agreed to lay a freight burden on the Pittsburgh coal. This feature of the situation caused much friction among the carriers, which heretofore have worked in harmony in the treatment of coal rates.

As indicated, the Chesapeake & Ohio Ry. in particular objected to the proposed advance as affecting the mines on its lines and at previous conferences with other roads declined to join in the plan. The rates from West Virginia and Kentucky to Ohio points are now 25c. higher than from Ohio mines to the same destinations, and it is now proposed to make them 40c. higher, so as to enable Ohio producers to do more business in their home state.

To preserve the graduation of rates, Indiana and Michigan destinations near the Ohio state line would have to be advanced, so that a horizontal increase of 15c. a ton will be placed on practically all coal moving from Pennsylvania, West Virginia and Kentucky mines to consuming points in Ohio, eastern Indiana, eastern Michigan, and possibly the Province of Ontario.

Railroads Attacked for Restraint of Trade

The producers in West Virginia and Kentucky are already organizing to fight the advance and have asked the support of their senators and congressmen in an investigation, which will bring up the question of the reasonableness of the advanced rate, the interest in coal lands held by the carriers making that rate, the control of said carriers by other lines serving competitive coal territory and the restraint of trade in West Virginia and Kentucky to promote coal production in Ohio.

The Interstate Commerce Commission can deal with the first three questions, but is not charged with the enforcement of the Sherman act, and the fourth question may come up in Congress shortly after it convenes next month, should the carriers file the advanced tariffs, as is now anticipated.

The points that will be considered by the Interstate Commerce Commission when the new tariffs are filed can be summarized as follows:

1. The right of the State of Ohio to force by statute the production of Ohio coal at excessive labor cost and the proposition to equalize this handicap by reducing the charge for transporting it to an Ohio market.
2. The right of the carriers in West Virginia, Virginia and Kentucky to restrain trade on their lines in those states by adding 15c. to the coal rates into Ohio, so as to relieve the Ohio carriers from a reduction of that amount. The West Virginia and Kentucky operators claim that this is "unionizing their mines by proxy," and the controversy between these two competing fields has waged largely over this special point.
3. The right of carriers in West Virginia and Virginia to control coal lands through the ownership of stock in corporations owning coal properties, said carriers being subject to the act to regulate commerce, but maintaining subsidiary holding corporations which are not.
4. The right of coal carriers in the State of Pennsylvania to control rates from competing mines in West Virginia, Virginia and Kentucky through the ownership of stock in the carriers serving those fields.

Frequent Strikes in the Panther Creek Valley

There has been some trouble at the mines of the Lehigh Coal and Navigation Co., where a retrenchment policy has been put in force. Several men who were engaged in dead work were laid off either for a few days or indefinitely, and it was noted that the newer men were retained in some instances and the older hands laid off. It was also declared that the discrimination appeared to be exercised against leading union men, and 2,600 men at Nesquehoning No. 10 and Spring Tunnel collieries went on strike Nov. 17.

At the same time the 3,100 employees at collieries Nos. 4, 5, 6 and 11 who struck in the previous week returned to work without any concessions. This strike arose because some of the men went to work without their union buttons. The electricians appear to have been leaders in the disaffection, their grievance being that several of them had been suspended.

Judge Dayton's Injunction Again in the Courts

Judge Alston G. Dayton, of the United States court, has pronounced new sentences at Philippi against four labor organizers who were convicted last spring of violating Judge Dayton's injunction prohibiting strike organizers or their sympathizers from interfering with the operation of coal companies at Wellsburg, W. Va., during a strike which was then taking place.

The persons, when sentenced before, entered immediately on their terms of imprisonment. They were released later on bond to ask for an appeal, but this appeal was denied them. They were sentenced on Nov. 16 for the balance of the time yet to be served. Fannie Sellers, Pittsburgh, Penn., James Oates, Charleroi, Penn., and Fred Ledvinka were each sentenced to serve three months and 15 days; Hiram Stephens, Wellsburg, W. Va., received two months and one day. A writ of error has been issued for Fannie Sellers and she has furnished bond to appear at the next term of the United States district court.

Editorials

Perversities of Human Nature

The workmen's compensation bill is revealing some of the worst sides of the more undesirable of us. Sometimes it seems as if it would be better for the industry to hide the crooked tricks of some of those who would take advantage of the compensation acts. For we need to keep firm hold on the sheet anchor of our belief that the average workingman is a sterling good fellow and ill-disposed to take advantage of anyone. Only by confidence can we inspire confidence.

As an illustration of an unfair attempt to take advantage of the law a case in the Bell County Circuit Court of Kentucky may be instanced. Godfrey Jackson worked for the Elk Coal Co., and after he had left its employ for a year he committed suicide. His family brought suit, saying that the bad air in the mines had so affected him that in a moment of depression he had laid violent hands on himself. Of course the court gave a verdict for the defendant company.

But after all is not this suit, unjust as it was to the Elk Coal Co., really only a natural outcome of the compensation act? Here is probably a widow—the report does not state specifically that it was a widow—deprived of her source of livelihood and needing compensation. She naturally and rightly reasoned that she needed it as much as if her husband had been killed by a shot in the mines or a fall of roof.

But the Kentucky laws say that the accident of death determines the whole matter. If a cancerous growth is the cause, there is no recovery, even though that disease is common enough. But if a roof fall is the cause, the widow must be compensated even though the mines of Kentucky are so safe as hardly to modify in any degree the duration of life. In fact they may even extend its span, so free are they all from accident and so conducive to health are so many of them.

Why is an occupational disease or accident singled out for consideration? Are we not all in Uncle Sam's big dwelling, and if he fails to take care of us or we fail to take care of ourselves or if we are unable to protect our own lives, surely in any event Uncle Sam is just every bit as liable for a compensation as the coal operator? The widow is just as much a widow whether the so-called horrid mine or the so-termed pleasant village street is the scene of the demise. That is why workmen's compensation leads inevitably to state insurance.

These are facts. Though there has been poetry written about beautiful trees and happy homes and little or none about the works or the mines, nevertheless it is not any more pleasant for the widow to have her husband killed by a thunderbolt under the spreading chestnut tree or to have him strung up by the neck to the roof beams of the home till he is dead than to have him crushed by a roof fall in the mines or by a crane in the factory. A lot of thoughtless nonsense, written about the mines and the factory, has caused us, however, to take a different view.

Cases there will always be in which companies are victimized; in fact, to have to pay any compensation at all where a man is himself to blame is unfair. Still there is a larger measure of justice than of injustice in compensation, and we must keep our minds firmly set on its brighter aspects, endeavoring always to lead the public and the employee to a clear apprehension of what is right and best for all concerned.

⁂

Why Different Grades of Coal Fluctuate Independently

There is always a tendency to believe that all the grades of a product should fluctuate in price proportionately, for the cost of production of all sizes usually advances and falls in a given proportion and that fact, it is argued, should make the mutations in selling price uniform. Unfortunately demand is at least as important as supply, and some people do not want any one product so badly that they can be trusted not to purchase a substitute. So as the traffic in the one product will not permit of a higher price, the schedule cannot be changed for that item, and all the advance in production cost must be charged against the business which refuses a substitute.

"What the traffic will bear" is frequently a correct basis for charges, often as that has been denied. It discourages the manufacture of products not desired, and where their production is unfortunately inevitable, it provides an outlet for them which prevents their being wholly wasted. These are the eternal laws of trade not peculiar to this time nor to the coal business nor to this country, though they have a peculiar pertinency when changes are likely to take place in the production cost of an article like anthracite coal.

The demand for anthracite in the larger sizes is still almost without a rival, whereas in the lower sizes only past use and the type of boiler-furnace grates already installed prevent many users of anthracite coal from deciding to make a change in fuel. Such customers once lost might not be regained even if the price of the anthracite fuel were much reduced. Many a manufacturer hesitates to change to a soft fuel and face the possibility of conflict with the smoke ordinance officers. Once the trick is turned he will feel a confidence that will make it difficult for the hard-coal salesman thereafter to reconvert him to the use of an anthracite fuel.

It has been said that the poor are the biggest purchasers of large coal and the rich manufacturers buy the smaller grades and that if any distinction is made the rich man should suffer, not his poorer fellow. But the costs of fuel are ultimately always added to the manufacturer's selling price, and any marked increase in the price of small sizes would unquestionably be reflected in higher prices to the workman for manufactured articles.

So it is a condition not a theory which confronts us. If the operator can only sell to the manufacturer by keeping his price down, then he must keep that price at the low level or not sell at all. If he fails to market any of his smaller coal, then the consumer of the preferred sizes must pay for all that is thrown away as if it were so much rock. That is an economic necessity, and it is better that the discriminations which exist in any mixed product should continue. Who pays for straw as if it were grain or for bran as if it were flour? They are all products of one and the same field, but they cannot bear the same price per unit weight or measure. Stable litter must rise or fall in price with the bedding market, and chicken feed will not rise and fall concurrently with the material for making fine bread.

Anthracite Operators' Burdens

In the coming spring there will be an attempt made to put a most unreasonable burden on the anthracite operator—a burden which he can hardly hope to transfer to the back of the consumer who should carry it. The public is not a keen observer of first causes and tends always to lay the blame for increased prices on the operator who pays the bills and not on the parties who receive the money. So it is well to point out just where the necessity will arise for an increased rate for coal at the mines, and to label the burden so that the public will know just who it was demanded that it should be carried.

And burdens are burdens, be they just or unjust. The operators have on Jan. 1 to face the cost of compensation. Hitherto there has been practically none obtainable. The miners have worked under foremen certificated by the state, and therefore the courts have decided that the foremen and not the operators have been to blame when an accident occurred. This has all changed. The operator must shoulder the whole burden and rightly so, but because the load is rightly laid on the shoulders of the operator, and even with his good will and assistance, is no reason why it is not burdensome to him nor any reason why the consumer of the product should not accept the load as his own. For it is for the benefit of the consumer that the coal is dug, and the toll of the industry should be paid cheerfully by those whom the industry benefits.

Another item of increased cost is that of taxation. The taxes, including the 2½-per cent. valuation tax, which is, it is true, of doubtful validity now the Roney bill is declared null and void, have increased 150 per cent. since 1910, and concurrently the assessed valuations have increased and even in some cases doubled. This is a burden constantly increasing, but of course not wholly one which will be new in the coming year.

The demands of the union will of course form the biggest item. It is almost impossible to believe that they will be granted. They amount to nearly 67c. per ton of an increase on the domestic sizes. With the cost of compensation, the increase may have to be 75c. per ton.
